STANDARDIZING ACCOUNTING FOR FINANCIAL REPORTING

Katherine Kinkela, Iona College

Fay Teplitsky, New York Institute of Technology

Peter Harris, New York Institute of Technology

ABSTRACT

Have you ever wondered how the world might act if all financial reporting standards were the same? The way people think may change, the world would have a better vision of fair value. Education for the different business fields may change. In the end we would have harmonization if the world would have standardized financial reporting. Today, standardizing accounting is a current and widely discussed topic. While many participants support it, why we can't achieve it is an open question. Every year this question is being brought up at several international conferences based on this topic. For more than two decades our world has been attempting to standardize accounting. It has been widely discussed throughout the accounting and business world but we are still far from reaching this large goal of having all standards the same. The purpose of this proposal is to create a new approach to establishing the universal standardization of the U.S. GAAP.

INTRODUCTION

The movement was first started by the IASC (international Accounting Standards Committee) in the 1980's but then in 2001 the IASC was remade into the IASB (international Accounting Standards Board). The IASB is working with the FASB currently after both signed a memorandum that outlined the process of standardizing, in 2006. Since then, we have not made much progress. Both the IASB and FASB's goals are to make the U.S. GAAP (Generally Accepted Accounting Principles) the universal standard for financial reporting/accounting. The main problem with this course of action is that each country has their own standards and some of those standards for financial reporting cannot be harmonized with other standards like the GAAP, because of certain environmental and non-environmental differences of each country.

After thinking about the concerns involved with standardizing I have thought of a new approach to standardizing which involves the adoption of the U.S. GAAP by pieces. "By pieces" I mean, to adopt these standards by nation or country by country until a majority or all countries have adopted it. Rather than having just "events" for the need of standardizing financial reporting. We should get a nation to adopt it like the UK; which has a large influence on other nations. As well, from different studies showing which countries/nations where most interesting in the movement of standardizing, the UK had been one of the largest supporters for the movement. If the UK were to adopt it first it could cause for peer pressure to other nations and help the action of standardizing to adopt much more quickly than it has been so far.

The need for standardizing accounting is to create a better understanding of fair value throughout the world. In the past we have been trying to harmonize accounting but there have been numerous complaints of misinterpretations of the standards and problems translating certain parts of the regulations. Standardizing financial reporting would create a better understanding of information given from these reports.

This needs to be solved now because there are many businesses that look to investing their money into banks around the world because of lower taxes or legal entities that may contribute to their business. Throughout the years we have been seeing this happen continuously with more and more businesses, looking towards putting their business into other countries. This has created problems dealing with fully understanding GDP and fair value through the evaluation of businesses.

Either way events like European Economic Council (EEC), General Agreement on Trade & Tariffs (GATT), and the North America Free Trade Agreement (NAFTA) are going on each year to discuss accounting standardization. At these events that are already in place, we should have the following to help serve as representatives and analysts for our movement: 1-2 experienced lawyers in the accounting field from each nation, the organizations that are part of creating the accounting standards for each country, the IASB and FASB, and several auditors to as well help evaluation the standards. With these different groups of people we will be able to better evaluate what is needed to be added if anything is needed to help fix the standards to satisfy the different environmental and non-environmental factors that are in the way of standardization. This may take from five to ten years (5-10 years) to fully evaluate and add changed to the standards so that a majority of countries will feel comfortable with the new set of standards to the U.S. GAAP. Once these are all evaluated with the information we have currently acquired and the new set of standards will be made, we would then go into the next stage of our movement which is to standardize these regulations throughout countries all around the world. We should first reach out to the UK, which will set off the plan by creating leverage with their popularity. The UK is one of the world's biggest leading nations, with them having adopting the standards, other countries are already forced into following the footsteps of both the UK and America to keep alliances and fit in.

Given the current state of the universal accounting systems and complications, exploring methodologies to strategies to vacillate the convergence of accounting standards might increase business effectiveness and remove what otherwise might form undesirable arbitrage situation in global markets.

THE ROLES OF THAI ENGINEERS AND JAPANESE ENGINEERS IN INTELLECTUAL PROPERTY CREATION OF JAPANESE COMPANIES IN THAILAND

Masayuki Kondo, Yokohama National University

ABSTRACT

Japanese companies have established a large number of technology centers as well as factories in Thailand. The Japanese share of foreign direct investment in Thailand in 2012 was 63.5 percent. This paper analyzed the US Patent Database to find out how many intellectual properties of Japanese companies were created in Thailand by Thai engineers and how Thai engineers and Japanese engineers in Thailand and those in Japan collaborated in creating intellectual properties. The paper found out that a substantial number of patents and some industrial designs were created in Thailand. For patent creation, in the beginning, mainly Japanese engineers in Thailand collaborated with Japanese engineers in Japan in creating patents. Thai engineers increased their role in Thailand as time went by and collaborated with Japanese engineers in Japan constantly. For industrial design creation, from the beginning Thai engineers were major players in Thailand and collaborated with Japanese engineers in Japan. This division of labor in creating industrial designs continued.

KEYWORDS: Cross-Border Inventions, Intellectual Property, Japan, Thailand, US Patents

INTRODUCTION

Since Japan is located in Asia, Japanese companies naturally globalize their operations with some emphasis in Asia. China, Thailand and Indonesia are popular destinations for Japanese companies to establish manufacturing companies. For overseas R&D centers, the current popular destinations for Japanese companies to have R&D centers are China, the United States, Thailand, Western Europe, and Korea according to JETRO (2014) (Table 1). As Ueno et al. (2008) point out that the R&D destination of Japanese companies shifted from North America and Europe to Asia. For near-future overseas R&D destinations, although China is the most popular destination, Thailand is the second for localization function and for new product development function. Therefore, Thailand is a popular destination as an overseas R&D site for Japanese companies. According to the classification of overseas R&D centers by Ronstadt (1977), the R&D centers of Japanese companies in Thailand are Transfer Technology Units (TTUs) or Indigenous Technology Units (ITUs) because they are for localization and new product development.

Table 1: Japanese Company Destination of Overseas R&D Function

Currently		In Three Years	
		New Product Development	Localization
1	China	China	China
2	The United States	Thailand	Thailand
3	Thailand	The United States	The United States
4	Western Europe	Indonesia	Indonesia
5	Korea	Taiwan (4 of the same rate)	Singapore

Source: The author tabulated using the data in JETRO (2014). This table shows that China and Thailand are popular overseas R&D function destination for Japanese companies.

This paper analyzes to find out how many intellectual properties of Japanese companies were created in Thailand by Thai engineers and how Thai engineers and Japanese engineers in Thailand and those in Japan collaborated in creating intellectual properties. The paper is largely based on Kondo (2013).

Intellectual Property (IP) Creation of Japanese Companies in Thailand and Thai Engineers

In order to analyze the IP creation activities in Thailand of Japanese companies, the author used USPTO (United States Patent and Trademark Office) Registered Patent DB (database) (1976 – 2012) because of availability. This DB contains patents, industrial designs and new plant varieties. However, new plant varieties were not found in the retrieval. Retrieval conditions are: “Assignee Country” should include “Japan” and “Inventor Country” should include “Thailand”. Then, the author identified Thai inventors/designers and Japanese inventors/designers by name. Thirdly, patents were classified by the three inventor types. The three inventor types are:

Patents with Thai inventors in Thailand (No Thai inventors were found overseas.),

Patents with no Thai inventors in Thailand but with Japanese inventors in Thailand, and

Patents with no Thai inventors and no Japanese ones in Thailand but with the third country inventors in Thailand.

In addition, the existence of Japanese inventors in Japan is checked. Findings are as follows. For patents, the patent creation activities of Japanese companies in Thailand started in the late 1980s. In the beginning, Japanese in Thailand together with Japanese in Japan created patents. In 1990s Thai inventors started to appear. Also, some foreigners in Thailand were sole inventors. In 2000s, the role of Thai engineers became substantial in patent creation, though the role of Japanese engineers in Thailand were still important. In any decade, Japanese engineers in Japan were involved largely. An interesting thing is that some inventors in other countries were involved in patent creation. In other words, some patents were created through an international network, As Subramaniam and Venkatraman (2001) suggest, cross-national teams have great new product development capability. The situation was quite different in industrial design. The industrial design activities of Japanese companies started only in the latter half of the 2000s. The design activities were conducted by Thai s in Thailand and Japanese in Japan.

CONCLUDING REMARKS

From the analysis of USPTO Registered Patent DB, the transfer of design and development (D&D) function of Japanese companies from Japan to Thailand is summarized as shown in Figure 1.

Figure 1: Design and Development Function Transfer

This figure shows how Thai engineers have increased their role and that Japanese in Japan are still important.

D&D function was transferred to Thailand and some other countries from Japan as a D&D site concerns. For inventors of patents, the role of Thai engineers increased their importance, while the role of Japanese in Thailand and Japanese in Japan are still important. For industrial designs, Thai designers played an important role from the beginning together with Japanese designers in Japan.

The author plans to conduct a similar analysis in China, India and so on.

A PRACTICAL MANAGEMENT SYSTEM FOR THE EFFECTIVE USE OF OFFSHORE SOFTWARE PROJECT OPPORTUNITIES

Alex Osadchyy, Kyocera Document Solutions Development
Jon K. Webber, University of Phoenix

ABSTRACT

There is a knowledge gap on how companies can realize opportunities beyond traditional economic benefits when outsourcing to destinations like Ukraine with a high concentration of scientists and complex expertise. Our qualitative, grounded theory research was conducted to explore and deepen the understanding of how middle and low level managers can initialize and manage information technology (IT) outsourcing projects. The study involved 17 managers and leaders working in Ukraine in offshore software development companies. The authors' findings offer insights in to categories which form the foundation of a new theory on the role of natural systematic approaches with social networking technologies in effective software outsourcing to Ukraine. The study results indicate that applying a combination of concepts in the new theory as a strategy, allows managers to overcome barriers and achieve the realization of opportunities beyond traditional benefits in outsourcing. Such opportunities include achieving value-added results, vendor motivation, improved software quality, efficiency of outsourced development and timely delivery, as well as organizational growth potential.

LITERATURE REVIEW

While much knowledge exists on the mutual benefits in international outsourcing engagements, outsourcing continues to be used mostly for a short-term economic advantage with advancement limiting long-term consequences (Alexandrova, 2007; Aspray, 2010; Belcourt, 2006; Elango, 2008; Kumar, 2007). Large outsourcing markets with inexpensive labor, such as China and India, are well utilized but destinations like Ukraine with a high concentration of scientists and complex expertise remain undervalued (Aspray, 2010; Nation Master, 2002; Rosenberg, 2010). Since the first European computer was created in the city of Kiev, Ukraine has played the major role in the former Soviet Union's IT competition with the United States (Fitzpatrick, Berkovich, & Kazakova, 2006), and has continued to retain its scientific potential and complex expertise with 30,000 IT graduates for the workforce each year (Aspray, 2010; Nation Master, 2002; Rosenberg, 2010; "Ukrainian Outsourcing Market," 2007). Yet, while Ukraine has been on an independent path, it lacks a leadership model that will enable fulfillment of its IT industry potential on the global arena (Barbash, 2009; "Ukrainian Outsourcing Market," 2007). The aim of this study was to fill the knowledge gap on how a practical management system with enabling information and communication technology can help effectively initialize and manage outsourcing to Ukraine with its unique situation in the software development industry.

Initially, offshore IT outsourcing was driven mostly by cost (Patki & Patki, 2007). However, the accelerated rate of globalization and technology advancements have significantly increased the value of innovation, knowledge and process for many companies (Jung, Choi, & Songa, 2007; Perry, Candlot, & Schutte, 2010) and extended expectations in offshore IT arrangements beyond traditional benefits. Clott (2007) maintained that project and mid-level managers at a client, when entrusted with implementing offshore IT arrangements, need to operate with outsourcing vendor members in different time zones, across cultural differences, and over geographic distances. These IT project managers must face the tactical and strategic challenges of managing project members, vendors, and outsourced activities across multiple countries while possessing little diverse management experience (Clott, 2007). Theories of social networks (Vithessonthi,

2010) and the practical management system of an organic systems analogy in organizational management (Midanek, 2008) offer needed mechanisms to effectively manage large virtual organization in broad-scope projects.

One primary research question guided the inquiry of this study: What theory might explain the influence of a practical management system with information and communication technology on the effectiveness in offshore IT outsourcing arrangements? Low-and middle-level managers in developed countries may use different practices to achieve the realization of offshore software development project opportunities like is seen in Ukraine. The data from previous research on developed countries' perspectives (Chadee & Raman, 2009; Hansen, Schaumburg-Müller, & Pottenger, 2008) and best management practices (Bowman, 2010; Kawamura & Nakamura, 2008; Pang, 2010), were triangulated with the data collected from the interview questions in this study. The depth of collected data enabled fulfillment of the secondary purpose of the study, which was developing a grounded theory on a practical management system that may lead to the effective use of offshore software project opportunities.

RESULTS

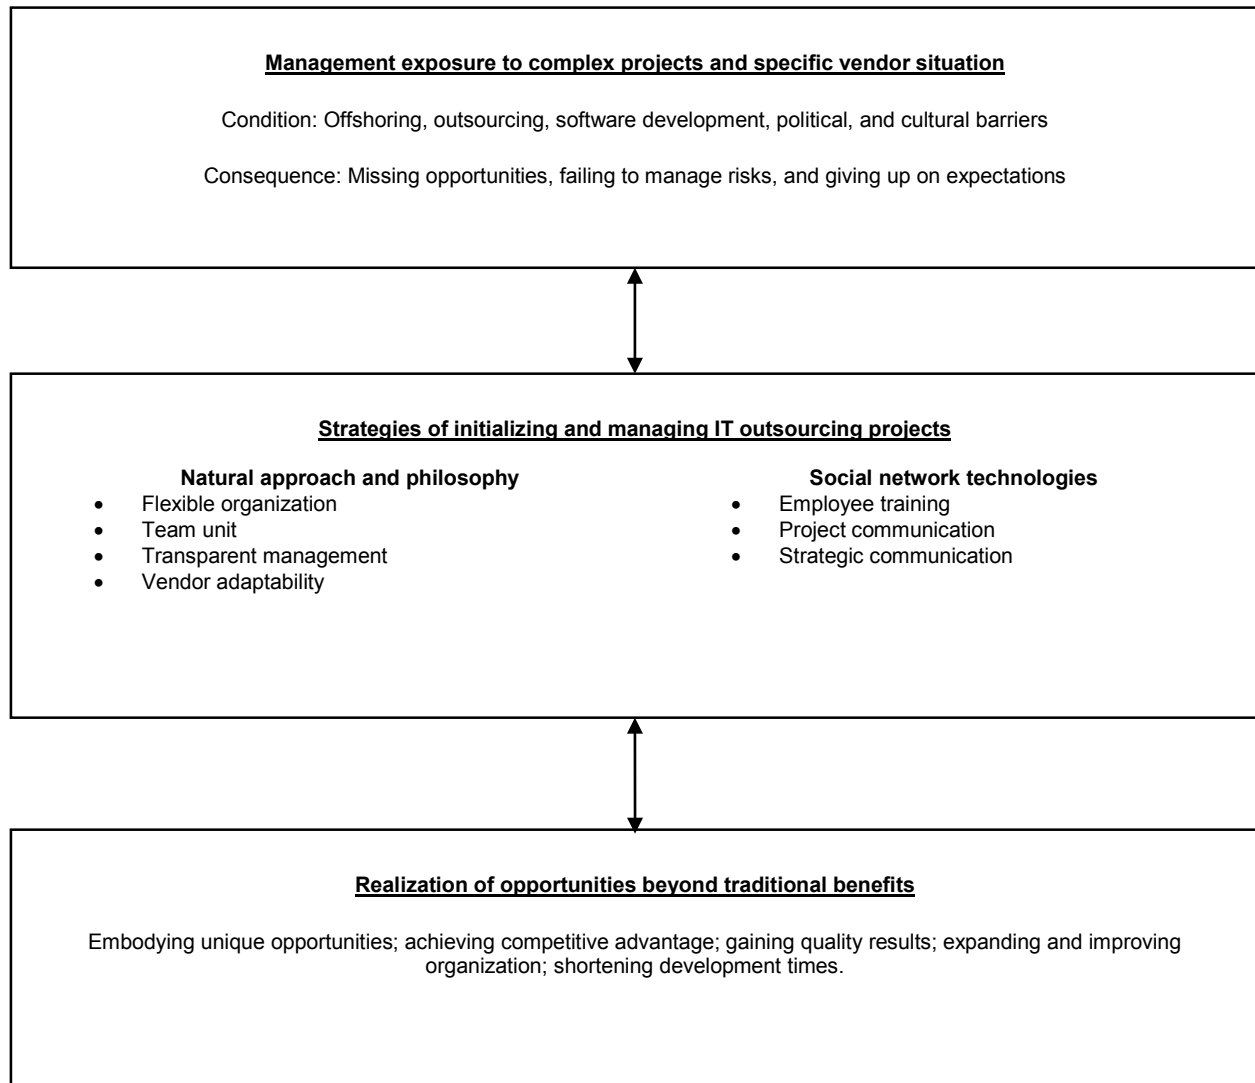

Analysis of the interviews of the 17 study participants led to identification of seven categories: (a) project communication, (b) employee training, (c) flexible organization, (d) strategic communication, (e) team unit, (f) transparent management, and (g) vendor adaptability. Figure 1 shows the identified thematic categories.

Figure 1: Core Categories in Grounded Theory

The findings of the current grounded theory indicate that the managers in outsourcing vendor companies within the sampled population appeared to be using and experiencing combinations of management theories that were coded under seven emergent categories, including project communication, employee training, flexible organization, strategic communication, team unit, transparent management, and vendor adaptability practices. Development and relation of the categories resulted in the theoretical model that portrays the general meaning (Creswell, 2007). Figure 2 illustrates a relation of the general situation, strategies in applying management practices, and achievement of special benefits in the theoretical model of initializing and managing IT outsourcing projects to Ukraine.

Figure 2. Theoretical model of initializing and managing IT outsourcing projects to Ukraine.

Perspectives of the 17 managers and leaders included in this study were generalized through triangulation and analysis, which led to the construction of a new grounded theory: Natural systematic approaches for effective outsourcing. The theory constitutes seven principles of project communication, employee training, flexible organization, strategic communication, team unit, transparent management, and vendor adaptability. Strategies of combining those principles represent the perceptions and beliefs of low- and middle- managers on initialization and management of IT outsourcing projects. The findings of the current study indicate the application of management practices lead to realization of opportunities beyond traditional benefits in offshore software outsourcing.

CONCLUSIONS

The participants addressed concepts, which are consistent with the conceptual models derivative from the theoretical framework including the importance of shared vision and leadership; management transparency; relationship focus; adaptability; flexible internal structure; small unit efficiency; education; shared culture;

new technology; technical and business expertise; language and methodology flexibility; growth and ongoing improvements. The significance of findings to leadership in client and vendor companies in outsourcing, as well as in governments of countries with similar IT outsourcing situation is in potential generalizability of the developed grounded theory. The knowledge of the perceptions and beliefs of outsourcing managers and leaders will benefit country leadership to strengthen their countries positions in the world service offering market. Leadership of organizations outsourcing IT activities may gain profound understanding of managerial practices and levels of technologies applicable to Ukrainian outsourcing and countries with similar situation. The study is also significant to companies seeking to outsource IT activities. An easy to understand and imagine practical management system applied with the IT will lead to effective initialization and management of outsourcing process.

THE EFFECT OF ANNOUNCING A CHANGE IN SHAREHOLDERS' EQUITY STRUCTURE ON CORPORATION'S STOCK MARKET PRICE AND FUTURE PROFITABILITY-AN EMPIRICAL STUDY ONEGYPTIAN STOCK MARKET

Tarek M. Metwally, Damanhour University

ABSTRACT

This paper investigates the rationality of the Egyptian market reaction to the announcement of stock split, stock dividend, and stock repurchase as three popular forms of change in shareholders' equity structure. Using a sample of 82 announcements by corporations listed in the Egyptian stock exchange, I apply an event study methodology and find that the market perception of corporate events as good news can be used as a criteria to rank the three corporate events in the following order: stock dividend, stock repurchase, then stock split (if any). Further, I conducted two association tests to examine the relationship between the documented market reaction and two alternative measures of future profitability (EPS and ROE) and I find that changes in future profitability don't justify the documented market reaction indicating that most Egyptian investors acted irrationally and misunderstood the logic behind each of the three corporate events. This is consistent with the irrationality documented by Charitou et al (2005) regarding the Cyprus stock market as another emerging capital market.

JEL: G140, G320, G350, M400

KEYWORDS: Market Rationality, Event Study, Shareholders, Ownership Structure, Stock Repurchase, Stock Split, Stock Dividend, Financial Accounting

INTRODUCTION

According to the Egyptian accounting standard number 1, financial statements presentation, there are two main sources of changes in shareholders' equity structure of a corporation: First, changes resulting from transactions with company's shareholders such as: stock split, stock dividend and stock repurchase. Second, changes resulting from transactions with other than the company's shareholders and these changes will eventually be summarized in the number of net income (or loss) that is presented in the income statement for each accounting period. Therefore, the study is mainly concerned with investigating the effect of announcing stock split, stock dividend or stock repurchase (changes resulting from the first source) on future profitability (changes that will result from the second source).

Despite a stock dividend is a stock distribution that increases the number of outstanding shares and a stock repurchase is a stock consolidation that decreases the number of outstanding shares, both of them are types of corporate payout mechanisms. However, stock split is not a corporate payout mechanism, yet it resembles stock dividend in that both of them are types of stock distributions that result in accounting rearrangements of the shareholders' equity structure. Moreover, this study distinguishes between two main types of change in shareholders' equity structure of a corporation: First, a change in the ownership structure in terms of the number of outstanding shares and the par value per share. Second, a change in the monetary values structure in terms of the total values of the shareholders' equity accounts. Accordingly, major differences among stock split, stock dividend, and stock repurchase can be summarized in table 1. Although prior studies proposed many hypotheses to explain the underlying reasons for a firm to make a decision to

split, freely distribute, or repurchase its own shares, the most prominent explanation was provided by the information signaling hypothesis (ISH). This hypothesis is derived from the signaling equilibrium model developed by Spence (1973, 1974). The ISH suggested that managers attempt to influence the market by signaling favorable information through the announcement of stock split, stock dividend or stock repurchase. Furthermore, numerous studies (e.g. Fama et al, 1969, Asquith et al, 1989, Bechmann and Raaballe, 2007, Yague et al, 2009) have suggested that the information content of the signal conveys favorable private information from managers to the market about future profitability. Therefore, many researchers linked the announcement of stock split, stock dividend and stock repurchase to future profitability through the ISH. Accordingly, the ISH suggests that announcing a change in shareholders' equity structure using any of the aforementioned events conveys a signal from management about future earnings increases or at least future sustainability of recent earnings i.e. recent earnings are not transitory. Thus, the basic components of the ISH can be illustrated in figure 1.

Figure 1: Basic Components of ISH

To be credible for investors, a signal must be costly. If a firm with favorable private information about future profitability splits its stocks, then its percent bid-ask spread will increase temporarily. Eventually, the market will come to perceive the same favorable information causing improvement in firm's stock market price and the percent bid-ask spread will decrease. However, if a firm without favorable private information splits, then its percent bid-ask spread will increase permanently. This cost differential allows firms with favorable information to signal and prevents others from false signaling (Goyenko et al, 2006). Also, The ISH links stock dividends to earnings through the notion of "financial slack" which means that firms may want to retain some funds as reserves to be used in financing future growth opportunities and securing future cash dividends. Therefore, when firms announce stock dividends that are taken from the financial slack, they could be signaling their confidence in achieving a high level of slack more easily in the future because they expect to sustain their current earnings or even improve their future earnings (Ho and Ramanan, 1997). Accordingly, this hypothesis suggests that managers will distribute stock dividends only if they have favorable private information that they will be able to replenish the retained earnings (RE) again by future earnings. That is why prior studies refer to this hypothesis as Retained Earnings Hypothesis (REH). Despite a stock dividend can be more costly than a stock split because it imposes an additional opportunity cost of reducing RE available for future cash dividends, this opportunity cost is only a temporary cost in case of credible signaling because eventually RE will be replenished again by future earnings. However, the decrease in RE is permanent in case of false signaling.

Although the announcement of stock split or stock dividend creates an obligation on the firm to the actual execution while some stock repurchases may be announced but create no obligation on the firm to the actual execution. It depends on the method employed for the stock repurchase program. Specifically, two common methods are being used in the Egyptian stock market: Firstly, open-market repurchase program which doesn't create a firm commitment to the actual execution, hence it can be costless to announce a repurchase and not carry it out later. Secondly, fixed-price repurchase tender offers which can be even more costly than the aforementioned stock distributions because it is usually accompanied with significant cash outflows leading to obvious decrease in the financial position of the firm. Regarding the case of credible signaling, the cost of signaling future profitability is a temporary cost because the firm will sell its treasury stocks in the future at prices higher than what was paid for repurchasing them so the financial position of

the firm will increase again. However, in case of false signaling the firm will fail to sell its treasury stocks at higher prices hence continuing to suffer from a decrease in its financial position.

Importantly, the information signal (if any) is to be conveyed to the market at the announcement of a change in shareholders' equity structure e.g. stock split, stock dividend or stock buyback, while the actual execution of such a change does not convey any new information. Two basic questions are addressed in this study: First, does the market react positively to the information signal released by announcing a change in shareholders' equity structure through stock split, stock dividend, or stock repurchase? Stock market prices and cumulative abnormal returns (CARs) can be used as proxies for the market reaction. Second, do changes in future profitability after announcing a change in shareholders' equity structure justify the documented market reaction to such announcement? Future earnings per share (EPS) and future return on equity (ROE) can be used as accounting measures of future profitability.

This study is distinguished from previous studies along three dimensions: First, according to researcher's knowledge, this research is the first research to study the three events (stock split, stock dividend, and stock repurchase) in triple comparison using Egyptian accounting data. Second, this research is extended not only to investigate the market reaction towards the announcement of a change in shareholders' equity structure but also to determine whether the information content of such announcement does or does not convey favorable information about future profitability. Third, this research can provide some insights on the rationality of the Egyptian stock market based on actual financial data.

LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

Prior studies can be classified into three categories as follows

Stock Splits

A discrepancy exists among prior studies regarding the usefulness of stock splits. On the one hand, some studies (e.g. Fama et al, 1969, Asquith et al, 1989, and Yague et al, 2009) documented that managers announce stock splits to signal future earnings increases or at least future sustainability of recent high earnings level. Also, further support to the ISH was documented by Louis and Robinson (2005); Kunz and Rosa-Majhensek (2008); Elfakhani and Lung (2003); Westfall (2010); Kalay and Kronlund (2010); Tawatnuntachai and D'Mello (2002); Michayluk and Zhao (2010). In addition, Huang et al (2008) found that infrequent splits are more consistent with the signaling hypothesis. On the other hand, other studies (e.g. Huang et al, 2006, Huang et al, 2009, and Leledakis et al, 2009) suggested that stock splits are not useful signals of firms' future earnings prospects. In addition, Huang et al (2008) found that frequent splits are more consistent with the optimal trading range (liquidity) hypothesis. Despite the increase in institutional ownership, decreased trading costs, and increases in real personal savings, Chittenden et al (2010) found that, after decades of inflation and the average stock price falling, splitting stocks to return to an "affordable" trading range must be rejected as an explanation.

Regarding the price effect of stock splits, Westfall (2010), Yague et al (2009), Leledakis et al (2009), Lyrouti and Dasilas (2006), and Elfakhani and Lung (2003) documented a positive price effect towards stock split announcements from worldwide stock markets (e.g. U.S. market, Spanish market, Athenian market, Canadian market). Despite, these different environments, settings, and time horizons, there is a common finding that most investors react to stock splits announcements positively. This induces a need for investigating this finding in the Egyptian settings so the following hypothesis is proposed:

H1a: The market reacts positively to the information signal released by announcing a stock split. After a stock split announcement, investors may decide to trade the post stock split shares before they are issued. This is referred to as "when-issued trading". The results reported by Kemerer (2010) indicated that when-issued traded firms experienced superior return on total capital in the year of the split announcement through

two years post the announcement. Therefore, he inferred that the existence of when-issued trading or the lack of it, appears to provide evidence of the market ability to distinguish between firms that will continue to outperform the market versus those firms that might be sending false signals about their future performance. Another study in the US by Boehme and Danielsen (2007), found that information conveyed by the split event seems to be incorporated into the stock's price within a relatively brief period. This is consistent with the efficient market paradigm. In contrast, emerging capital markets may suffer from irrational behavior as documented by Charitou et al (2005) on the Cypriot emerging capital market. They found that stock splits were associated with the creation of a market bubble due to the inability of investors to correctly understand the stock splits, and then the positive split-induced returns are largely reversed in the post-split months. They suggested an investor irrationality explanation for these results. Consequently, there is a need to test the possibility that accounting measures of future profitability can provide evidence supporting the rationality of the Egyptian stock market by justifying the documented market reaction to stock split announcements. So the following hypothesis is formulated:

H1b: Future profitability after announcing a stock split is positively related to the documented market reaction to such announcement.

Stock Dividend

A modified version of the ISH is the REH which predicts that stock distributions accounted for by reducing RE are more credible signals of managerial optimism than stock distributions that don't reduce RE. The origins of the REH can be traced back to Grinblatt et al (1984) when they documented significantly higher positive average excess returns on and around the announcement and execution of stock dividends compared to stock splits. They attributed this to the reduction in RE that is generally associated with stock dividends. The REH is applicable in countries with code corporate law that restrict distribution of any cash and/or stock dividends is to the amount of RE only. Thus, stock dividends will decrease RE available for future cash dividends. In contrast, the US corporate law is a common law so statutes of most states (e.g. New York and Delaware) don't apply the concept of legal capital. Hence, the distributable equity available for cash dividends includes not only RE but also additional paid-in capital. This idea was addressed by Peterson et al (1996), as they found that more positive information is signaled if the stock distribution accounting choice reduces distributable equity available for future cash dividends.

This can be viewed as an expanded version of REH, and can be referred to as distributable equity hypothesis. The comparison between code corporate laws and common corporate laws is shown in table 2. In Denmark, Bechmann and Raaballe (2007) extended the aforementioned US related studies by comparing between stock splits and stock dividends. They found no separate announcement effect for stock split after controlling for a firm's payout policy. This is consistent with the REH that considers a stock split as a virtually cost free device since it does not decrease RE. Some additional evidence supporting the ISH was found in the Far East stock markets by Kato and Tsay (2002), Chen et al (2002), and Cheng et al (2009). However, Crawford et al (2005) found that the costs of false signaling underlying the REH were generally very small, questioning the validity of the REH. In addition, they replicated and extended tests of the REH contained in Grinblatt et al, 1984 and showed that their findings can be attributed to specification and measurement choices that bias the results in favor of the REH.

Indeed, most prior studies of the REH emphasized mainly US firms –e.g. Grinblatt et al, 1984, and Peterson et al, 1996). However, some studies examined Danish firms (e.g. Bechmann and Raaballe, 2007) and others were conducted on Far East markets (e.g. Kato and Tsay, 2002, and Cheng et al, 2009). Despite, these different environments, settings, and time horizons, there was a common finding that most investors react to stock dividends announcements positively. This induces a need for investigating the REH in the Egyptian stock market so the following hypotheses are proposed:

H2a: The market reacts positively to the information signal released by announcing a stock dividend.

H2b: Future profitability after announcing a stock dividend is positively related to the documented market reaction to such announcement.

Stock Repurchases

According to the wall street journal, a stock repurchase is a signal to investors that the firm's insiders believe their shares are being traded below fair value (McNally, 2002). In the US, Lie (2005) documented that firms reported significant improvement in operating performance relative to their peers after open market repurchase announcements, also the market responded favorably to earnings announcements after the program announcements—This is consistent with the ISH. Moreover, Wilber (2007) found that some firms take an extra step of repurchasing their own shares with cash and then use those shares to finance an acquisition of another firm, rather than using the cash to directly finance the acquisition. He justified this extra step by the undervaluation signaling hypothesis. Further, Skinner and Soltes (2011) concluded that regular share repurchasing firms have more persistent earnings than occasionally repurchasing ones. Some additional evidence supporting the undervaluation signaling hypothesis was found in the Far East stock markets by Hatakeda and Isagawa (2004), Firth et al (2010), and Chen and Hung (2010).

From another perspective, Massa et al (2007) showed that a firm, by repurchasing its shares, sends a positive signal about itself and a negative one about its competitors. This induces the competing firms to mimic the behavior of the repurchasing firm by repurchasing their own shares. This mimicking behavior does not imply favorable information about future prospects, but it simply implies a desire to undo the negative effects associated with other firms' repurchase decisions. In contrast to the signaling theory, Zhang (2005) found that, on average, open-market repurchasing firms did not exhibit strong superior abnormal performance either in the short run or the long run after actual share repurchases. Also, Eberhart and Siddique (2004) found no consistent evidence of positive long-term abnormal operating performance or stock returns following buyback announcements.

Those findings strongly support the conclusion of Evans and Evans (2001) that implementing a stock repurchases strategy is not a guarantee of superior long-run performance. Although prior studies on different capital markets –e.g. Lie, 2005, Keswani et al, 2007, McNally et al, 2006, and Hatakeda and Isagawa, 2004– found that repurchases provide price support for the repurchasing firms, a stock repurchase may be associated with positive abnormal returns even if the managers' intent is not to signal. Louis and White (2007) attempted to infer managerial intent from the financial reporting behavior of firms. They proposed that managers are likely to bundle upward discretionary accruals with share repurchases when they are most confident about their firms' prospects. Their results indicate that managers inflate earnings prior to fixed-price repurchase tender offers to intentionally signal their optimism about their firms' prospects. Moreover, Gong et al (2008) posit that both the post-repurchase abnormal returns and the improvement in operating performance reported by Lie (2005) were likely driven, at least in part, by pre-repurchase downward earnings management rather than genuine growth in profitability. Furthermore, Chan et al (2010) found that a subset of managers may announce open-market share repurchases with the intent of misleading investors.

This flows in line with the evidence documented by Chou and Lin (2004) when they investigated the possibility of false signaling by firms announcing open-market stock repurchases. Their findings supported the existence of management manipulation of discretionary accruals upward to persuade market participants that the equity of their firms is undervalued. Further, Hribar et al (2006) investigated whether firms use stock repurchases as an earnings management device to meet or beat analysts' earnings per share (EPS) forecasts. Their findings confirmed that meeting or beating analysts' forecasts influenced the stock

repurchase decisions of some firms. This provides incentive for investigating the reaction of the Egyptian market participants to stock repurchases announcements and their information content. So the following hypotheses are proposed:

H3a: The market reacts positively to the information signal released by announcing a stock repurchase.

H3b: Future profitability after announcing a stock repurchase is positively related to the documented market reaction to such announcement.

DATA AND METHODOLOGY

The initial sample consisted of all 189 stock splits, stock dividends, and stock repurchases announcements by firms listed on the Egyptian stock exchange over the period 2006-2008. Out of that, I eliminate firms with more than one of the three events announced in the same year, as it would be difficult to isolate the effect of each one separately. Also, announcements of stock dividends that weren't financed totally or partially from RE were excluded because the decrease in RE available for future cash dividends represents the cost that makes the signal credible. Further, I excluded any stock repurchases that were announced but not executed because such announcements can be costless. Finally, announcements by firms with incomplete or unavailable market data were also excluded. The final sample ended up with 82 announcements as shown in table 3. Data about events' types and dates were obtained from the market disclosure department of the Egyptian stock exchange. Daily closing prices of stocks were collected from the Egyptian stock exchange and Egypt for Information Dissemination (eg/ID) over a period of 7 days from day -3 to +3 around the announcement day (event day $t=zero$). Adjusting the per-share data for stock splits and rounding to the nearest piaster can cause inaccuracy or a loss of information – Baber and Kang (2002) and Payne and Thomas (2003). Therefore, the stock prices used in this study weren't split-adjusted or rounded to avoid any possible inaccuracy that may result from the split-adjusting and rounding procedures. Finally, EPS and ROE were obtained from Kompass financial yearbook 2009-2010 (issue 13) or calculated from the firms' annual financial statements obtained from eg/ID Company. However, future EPS data were adjusted to account for any future stock splits or stock dividends.

An event study methodology is applied to measure the market reaction to the information signal released by announcing a change in shareholders' equity structure through stock split, stock dividend, or stock repurchase. Differences in average closing stock prices and CARs between the pre-announcement window and the post-announcement window were used as proxies for the market response to such announcement. In addition, two association tests were conducted to examine the relationship between the documented market reaction and two alternative measures of future profitability (EPS and ROE).

RESULTS AND DISCUSSION

Based on average closing stock prices, I present results of testing stock splits, stock dividends, and stock repurchases hypotheses. Then, I re-examine these hypotheses using CARs.

Stock Splits

Regarding market reaction to stock splits, H1a has been statistically formulated in a null hypothesis (H_N: Median of Signed-Rank Differences (M) ≤ 0), and an alternative hypothesis (H_A: Median of Signed-Rank Differences (M) > 0); Where (M) is the median of the signed-rank differences between the means of closing stock prices pre-split announcement (\bar{x}_1) and the means of closing stock prices post-split announcement (\bar{x}_2). Table 4 shows the results obtained from conducting Wilcoxon signed-rank test using the Minitab statistical package. The test indicated a P-value of 0.305. This means that the alternative hypothesis is rejected at significance level $\alpha = 5\%$ (one-tailed test). Thus, there is no evidence supporting that the

Egyptian market reaction to the stock split announcements is generally positive. Therefore, H1a is rejected. Regarding future profitability after stock splits, the statistical formulation of H1b can be presented as follows: HN: $\rho = 0$, and HA: $\rho \neq 0$ Where ρ is the correlation coefficient between a future profitability measure (Δ EPS or Δ ROE) and the market reaction measure ($\Delta \bar{x}$). Table 5 shows results obtained from conducting the Spearman correlation tests using the SPSS statistical package. The P-values of 0.956 and 0.161 suggest that changes in future profitability do not justify the documented market reaction. Thus, H1b is rejected at $\alpha = 5\%$ (two-tailed test), and the rationality of the Egyptian market reaction to stock split announcements is not supported by practical evidence on future profitability.

Stock Dividends: Regarding market reaction to stock dividends, table 4 shows a P-value of 0.001 which provide evidence supporting that the Egyptian market reaction to the stock dividend announcements is generally positive. Therefore, H2a is accepted at confidence level 95%. Regarding future profitability after stock dividends, table 5 shows P-values of 0.191 and 0.930 which suggest that changes in future profitability don't justify the documented market reaction. Thus, H2b is rejected at $\alpha = 5\%$ (two-tailed test).

Stock Repurchases: Regarding market reaction, table 4 shows a P-value of 0.011 which provide evidence supporting that the Egyptian market reaction to the stock repurchase announcements is generally positive. Therefore, H3a is accepted at confidence level 95%. Nevertheless, the p-value in case of stock dividends (0.001) is less than that in case of stock repurchases (0.011). Thus, the positive market reaction to stock dividends is generally accepted at a higher confidence level than that of stock repurchases. Regarding future profitability, table 5 shows results obtained from conducting the Spearman correlation tests using the SPSS statistical package. The P-values of 0.403 and 0.051 suggest that changes in future profitability do not justify the documented market reaction. Thus, H3b is rejected at $\alpha = 5\%$ (two-tailed test).

Additional Tests Based on CARs: I re-examine the six hypotheses using CARs, instead of average closing stock prices, as a proxy for the market reaction. Daily abnormal returns are calculated by subtracting the daily returns of the EGX100 market index as the normal returns of the market from the daily actual stock returns. As follows: $AR_{i,t} = R_{i,t} - REGX100,t$, where $AR_{i,t}$ is the abnormal return on stock (i) for day (t), $R_{i,t}$ is the actual return on stock (i) for day (t), and $REGX100,t$ is the return of the EGX100 market index for day (t). Then, the CARs are calculated as follows: $CAR_{i,s,e} = \sum_{t=s}^e AR_{i,t}$, where $CAR_{i,s,e}$ is the cumulative abnormal return on stock (i) from the start of the measurement window (s) to its end (e), and $AR_{i,t}$ is the abnormal return on stock (i) for day (t). Tables 6 and 7 show the results of re-examining the six hypotheses in case of using CARs. These results confirm that only hypotheses H2a and H3a are accepted, but at a confidence level (90%) less than that documented in case of using average closing stock prices (95%). However, the result of stock dividends is still more robust than that of stock repurchases because the p-value in case of the former (0.070) is less than that of the latter (0.094).

CONCLUSIONS AND RECOMMENDATIONS

The results documented in this paper can be interpreted as evidence supporting the following inferences: First, Egyptian market reaction to split-announcements is mixed and cannot be justified by changes in future profitability. This is consistent with the discrepancy that exists among prior studies concerning the usefulness of stock splits. Second, Egyptian market reaction to stock dividend and stock repurchase announcements is generally positive. However, the result of the former is more robust than that of the latter. This can be attributable to the suspicions documented in prior literature concerning management manipulation of earnings around stock repurchases. Third, the market perception of corporate events as good news can be used as criteria to rank the three corporate events in the following order: stock dividends, stock repurchases, and then stock splits (if any). Finally, based on future profitability measures, most Egyptian investors acted irrationally and misunderstood the logic behind each of the three corporate events.

This is consistent with the irrationality documented by Charitou et al (2005) regarding the Cyprus stock market as another emerging capital market.

The sample of this study is selected based on restricted criteria, which resulted in excluding a large number of observations. Therefore, the generalization of the findings may be limited. Another limitation is the use of actual returns that are not risk-adjusted in calculating the CARs. This is due to the unavailability of the data needed to estimate the risk of each stock relative to the market (β_i). Shedding light on the Egyptian investment community led to more in depth vision of its irrational practices, the following recommendations can improve the situation: First, educating investors to improve their rationality. Second, developing and enforcing regulatory laws to protect investors from possible forms of management manipulation through corporate financial events. Third, although more data and information are becoming available on the official website of the Egyptian stock exchange, there is still a pressing need for more disclosures to improve the transparency. For example, the announcements of any stock dividends should include detailed information about the source(s) of financing these dividends, as they can be financed from RE, additional paid-in-capital, or treasury stocks. Besides, data on the actual execution of buyback trading are available on a weekly basis, while data on the execution of insiders' trading are available on a daily basis. Last but not least, Egyptian accounting standards should be revised in such a way that increases corporate financial disclosures. For instance, the method of carrying out stock repurchases should be disclosed in corporate financial reports.

APPENDIX

Table 1: Changes in Shareholders' Equity Structure and the Basic Accounting Equation As a Result of Stock Split, Stock Dividend, and Stock Repurchase

	Stock Split	Stock Dividend	Stock Repurchase
1. Ownership Structure:			
Number of outstanding shares	Increase	Increase	Decrease
Par value per share	Decrease	No Change	No Change
2. Monetary Values Structure:			
Capital stock	No Change	Increase	No Change
RE and/or Additional paid-in capital	No Change	Decrease	No Change
Treasury Stock	No Change	No Change	Increase
3. Basic Accounting Equation:			
Total shareholders' equity	No Change	No Change	Decrease
Total assets (T.A) and Total liabilities (T.L)	No Change	No Change	Decrease in T.A and/or increase in T.L

Table 2: Two Possible Versions of ISH Can Be Applied in Countries with Different Corporate Laws

	Code Corporate Law	Common Corporate Law	Egyptian Corporate Law
Cash dividends are restricted to:	RE only	RE and/or additional paid-in capital	RE only
Stock dividends are restricted to:	RE only	RE and/or additional paid-in capital	RE and/or additional paid-in capital
The applicable version of the ISH	REH	Distributable equity hypothesis	REH

MODELING OF THE RISKS IN SUPPLY LOGISTICS: CASE STUDY INVENTORY MANAGEMENT IN A TRADING COMPANY

Jorge Aníbal Restrepo Morales, Fundación Universitaria Autónoma de Las Américas
Lorenzo Portocarrero Sierra, Institución Universitaria Tecnológico de Antioquia
Juan Gabriel Vanegas López, Institución Universitaria Tecnológico de Antioquia

ABSTRACT

Problem. It is recognized as inventory problems related to very small or too big quantities they may be the cause of failure in business, an optimal inventory management means a very significant contribution to the profits of an enterprise besides it increases its revenue and its total assets (Thierauf, 2005). Purpose. Developing a model that provides information to maintain a level of inventory that ensures a level of service that fits the market requirements, minimizes the potential investments of working capital and determines expected losses due to excess / deficit inventory allowing to measure the impact of this heading in the profitability of the company TEXCOMERCIAL SAS Methodology. A Monte Carlo simulation is used to model the sales and inventories from historical information of three years; then the probability of loss events due to deficit or excess of inventory are determined and a stochastic utility matrix is constructed to determine expected losses due to shortages or excess of inventory. Findings. Empirical evidence in the company Texcomercial SAS, suggests an inefficient inventory management which produces repressed assets in warehouses, increasing working capital and reducing profitability, in addition to losses associated with the opportunity and storage costs, insurance and maintenance and inventory obsolescence.

INTRODUCTION

The growing importance of "customer orientation" for organizations, has become in high demand for procurement departments, which in turn transform it into higher demands on suppliers and storage activities. This translates into the need to address the overall management of inventories, first because of the importance to meet the ordinary course of the business and second for the costs associated with its inefficient management; either because it is hold up in warehouses or because sales are lost due to inefficiency generating high opportunity costs in both cases (Narasimhan, McLeavey, Billington, & Quinones, 1996). This project rigorously examines the different methods used to quantify operational risks associated with excess or shortage in inventories, considering the response times of the suppliers, the customers requirement to avoid affecting the continuity of the market and supply logistics at a reasonable cost for the organization. Defining an optimum inventory policy, enables the company to better control their processes; considering the enterprise as a system, all areas are interdependent, hence the importance of designing a model to quantify the expected losses due to excess / shortage of inventories to provide information that contributes to the efficiency of each of the areas. The inventory is a key asset for the company because of its direct relation to production, sales, purchasing, and finance, among others, becoming a fundamental part of the business.

Theoretical Reference

Inventories

The development of the inventory management theory dates back to 1915, when attention to the development of mathematical methods to support the establishment of optimal inventory levels was provided. Since then, increasingly sophisticated analytical instruments for inventory management have been applied, considering that inventories are the largest item of current assets for the balance sheets of

many companies (Thierauf et al, 2005). The most commonly known definition of inventory describes it as "the physical storage of products that a company keeps on hand to promote the smooth and efficient management of their operations" (Sasieni, Maurice. 1972, p. 85). In this line, an efficient management of inventories is very attractive due to the great economic and competitive benefits that contribute to the gradual growth of the company and to achieve expansion and market credibility. (Hiller, Frederick & Lieberman, Gerald, 2001, p. 935). Inventories are essential to sales, and sales are necessary for utilities. According to (Reyes, 2010) there are techniques for managing inventory as the ABC system, the basic model of economic order quantity (CEP) and the Re-order point.

Models for Inventory Management

The problem of inventory management is summarized in two questions when? And how much? The answer, allows to define strategies for its efficient management since it would be possible to demand planning avoiding unnecessary costs. There are models for inventory management that are tools to support decision-making, their correct use prevents and mitigates the inherent risks in the process and determines the efficient performance of the company in a highly competitive environment; within the range of systematic opportunities that can be implemented and adapted to any administrative scheme for inventory management. Although there are different models for inventory management, this paper considers the EOQ model " a mathematical model used as the basis for inventory management in which the demand and lead time are deterministic the deficits and inventories are replaced by batches at the same time" (Mathur Kamlesh, et al., 1996, p. 697). . This model considers the following parameters: D: Demand. Units per year; S: Cost of issuing an order; H: Costs associated with keeping a unit in inventory for one year; Q: Quantity to order Therefore the annual cost of keeping units in inventory is $H * Q / 2$ and the cost of issuing orders for the same period is $S * D / Q$. Therefore, the total cost of function (annual) associated with inventory management is $C(Q) = H * (Q / 2) + S * (D / Q)$. If this function is derived with respect to Q and equals zero (to find a minimum for the function), equation 1 for the EOQ model that determines the optimal order quantity is obtained:

$$Q^* = \sqrt{\frac{2DS}{H}} \quad (\text{Equation 1})$$

Montecarlo Simulation (Ms)

The MS is a technique that combines statistical concepts (random sampling) with the ability of computers to generate pseudo-random numbers and automate calculations. (Faulín & John, 2005). Along the same line, the simulation is a process in which a model of a real system is designed and experiences with it are carried out (Santaniello, 2003). Simulation is also discussed as the technique with which the environment in which an event occurs is imitated to use an analog model and obtain information on the process in question. To make MS an equation is needed, which will be the object of the simulation, and the data for it. The difference of this method with the traditional one in order to solve an equation is that Montecarlo considers uncertainty and that data entering the variables of the equation do not need to be a constant value but they can be a group of them. By simulating the equation is calculated several times, and in each iteration a random value for each independent variable is chosen, ensuring that these values have the same probability distribution as physical variable. This calculations are used to generate a graph known as frequency histogram and abundant information is obtained there in order to perform a series of analyzes.

METHODOLOGICAL DESIGN

This research quantifies the operational risks of shortages and / or excess inventories through mathematical and statistical models to provide information that facilitates an adequate control of the forecasted demand for inventory management. The method is inductive in character and contains an ordered, coherent and logical analysis of information. The data sources are primary and come from the historical data of five years provided by the shopping area of the Company. To calculate expected losses due to shortages and excess of inventory LDA, Utility Matrix and Monte Carlo simulation methods are used.

RESULTS

Distribution Adjustment For Severity And Frequency.

The LDA method was applied crossing the variable sales and the units of inventory, the results found among the excesses and shortages of inventory presented in the study period showed that both excess and shortages are an operational inventory problem they took the data units as frequency and severity of the inventory model were taken. Moreover, the data show operational problems in inventory, once the volumes were always above the safety stock. First an adjustment of probability distribution of the frequency and severity in units and cost of inventory was made. The results are shown in Graph 1.

Graph 1: Distribution Fix to Frequency and Severity for Inventories Excess / Deficit

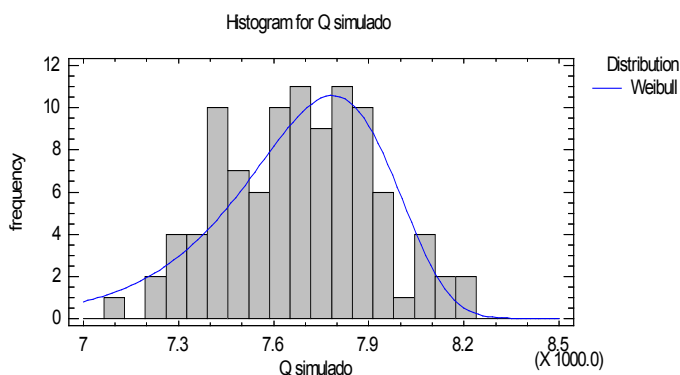

Variables	Fix Distribution	P-Value Test KS	DMas	DMenos	Dn
Frequency Units	Logistic	0.888579	0.0429377	0.0398184	0.0429377
Severity COP	Logistic	0.726952	0.0440792	0.0510448	0.0510448

Distribution Adjustment - Simulation "Q"

Using the distributions of adjusted probability for inventories and sales both in cost and units a Montecarlo simulation was run to generate several samples of size 52, due to the fact that they are being worked on a weekly basis and the economic lot should be annual. This process was performed 100 times and the same number of values were obtained for the economic Lot Q in each of the different simulations. Then the probability distribution was adjusted to determine the possibility of treating the ordered economic lot as a random variable. The results are shown in Figure 2.

Graph 2: Frecuency and Severity Probability Distribution Setting Excess / Deficit Inventories

<i>Probability Distribution Setting Q</i>	<i>Weibull</i>
<i>Valor P Test KS</i>	<i>0.761319</i>
<i>DMas</i>	<i>0.0669439</i>
<i>Dmenos</i>	<i>0.0661174</i>
<i>DN</i>	<i>0.0669439</i>

Matrix Utility

To quantify the expected losses of the company derived from historical data related cost of sales and inventory units were used, and conducted a Montecarlo simulation considering the distributions of each week of the year. 10000 simulations were performed and the results were averaged. With the results by week of the year, a histogram was assembled to feed the utility matrix. The results are described for both sales and inventories. The following Table 1 shows the result of the simulation for weekly sales and the relative frequency of the data is described regarding the simulated year. Weekly sales go from 284 to 1785 units.

Tabla 1: Resultado de la Simulación de las Ventas Semanales

Rangos	Frecuencia Relativa	Rangos	Frecuencia Relativa	Rangos	Frecuencia Relativa
284-384	3.92%	784-884	11.76%	1284-1384	1.96%
384-484	7.84%	884-984	7.84%	1384-1484	5.88%
484-584	23.53%	984-1084	5.88%	1484-1584	3.92%
584-684	7.84%	1084-1184	7.84%	1584-1684	1.96%
684-784	3.92%	1184-1284	1.96%	1684-1784	3.92%

On the other hand weekly inventory units vary from 2919 to 11296 approximately. Note that the inventory level exceeds statistically the weekly sales, so probably most of the operational problems are due to over stock. The frequency distribution of the above range is described in Table 2:

Table 2: Frequency Distributions Ranges For Inventories

Rangos	Frecuencia Relativa	Rangos	Frecuencia Relativa	Rangos	Frecuencia Relativa
2920-3478	5.77%	5153-5712	9.62%	7387-7946	5.77%
3478-4037	7.69%	5712-6270	5.77%	7946-8504	1.92%
4037-4595	13.46%	6270-6829	15.38%	10738-11296	1.92%
4595-5153	17.31%	6829-7387	15.38%		

Finally, to build the utility matrix both the unit cost of storing inventory as well as the opportunity cost of lost sales due stockouts were considered, for the latter it is considered the unit contribution margin. These costs are listed in.

Table 3: Allocation of Opportunity Costs and Storage

Costo	Valor
Costo de oportunidad	\$ 5,600.00
Costo de almacenamiento	\$ 292,25

The utility matrix, crosses sales and inventory variables with its participation rate and determines the expected value due to excess or shortage. To determine the opportunity cost, the average cost of all units in inventory vs average sale price for each unit were considered and the storage cost was estimated from the total value of logistics operation of the company (receipt, storage and dispatch). The result is divided on the capacity of the warehouse stowage reaching the figure. Now taking this value for stowage it can be determined how much is the cost of storing per month depending on the number of units of product that can be stored on stowage. Subsequently, the utility matrix that relates the values given by the simulation with their respective frequency and the associated costs was built. Finally, by comparing the results of the utility matrix a weekly expected loss of \$ 1, 339.409 was calculated due to the operational problems associated with the store. As stated earlier, this operational risk is due to excess in weekly inventories. That is, each week comes with a storage of goods cost of which rotation rate is greater than a week and has a value of \$ 1, 339.409.

Application of Stochastic Inventory Model

Subsequently and considering the random behavior of weekly sales, the optimal economic lot derived from a Monte Carlo simulation was calculated. Using the formula described in Equation 1. The economic lot to order is not determined based on a discrete demand, because it is calculated based on the simulation and empirical probability distribution set. After calculating the economic lot of the 52 weeks of a year the operational risk associated with this previously mentioned inventory policy was evaluated and finally it was averaged to determine an expected weekly loss of \$ 115.349 namely if a re-order stochastic policy is used to supply the inventory statistically and it is expected to incur in a much lower operational risk to which it is currently subject. In Figure 4, the amounts in inventory and the simulated sales together with the optimal economic lot every week. It can be inferred how the developed policy of inventory closely adjusts to the demand to minimize storage costs.

Figure 4: Number of Inventory and Simulated Sales and Optimal Economic Lot per Week

Implementing an inventory model to calculate a reorder quantity that takes into account the stochastic behavior of the variables involved, representing an annual savings of \$ 63, 651,124.83 in working capital. It must be remembered that this is only one of the 176 categories of the company.

CONCLUSIONS

The inventory of the company presents variations in its weekly behavior due to a seasonal component; consider an inventory policy focused on the stochastic behavior of sales and inventories, significant savings in operational risk. The company determines the investment in working capital in the overall in weekly inventories, but ignore the opportunity cost represented in each of their categories. Evidence of this, is reflected analyzing data from the line of fans which allows to infer that there is no proper inventory management resulting in significant financial losses.

RECOMMENDATIONS

The inventory is a critical item in the successful management of companies, when they incur in high costs due to storage or overstocking that exceed the demand, an inefficient management of logistics processes is evidenced, which must be corrected by keeping inventories at an optimal level and therefore the best recommendation is to use the optimal order quantity of orders through EOQ model and its forecasting of calculated demand. In decision making under uncertainty environments, consider making forecasts aimed to the anticipation of results and to evaluate the impact of these on actual performance in business, therefore it is important that the company analyzes and applies methods to appropriately assess the management of its working capital. The company Texcomercial S.A.S. the automation of the model developed in the category of fans to be replicated to the other categories of the organization to achieve optimum levels of inventory and cash flow which can also be reflected in the reduction of operational costs.

A CASE STUDY IN FRAUD PREVENTION: CHARLENE CORLEY

Fay Teplitsky, New York Institute of Technology, USA
Peter Harris, New York Institute of Technology, USA

ABSTRACT

This paper discusses fraud and both preventive and detection methodologies as they might apply to a historical case study (United States of America vs. Charlene Corley). Criminal fraud cases have emerged with greater frequency over time leading to improved detection methodologies such as Embedded Audit Modules and preventive methods including budgetary controls. These methodologies can help to ensure that companies maintain compliance with policies developed by regulatory agencies.

INTRODUCTION

Fraud and errors in accounting dates back to the 13th century where Europe became a monetary economy and began to develop bookkeeping. Luca Pacioli had developed the Double-entry Bookkeeping system in the late 14th century which led to more in-depth and accurate transaction recording. Since it was developed, today we are continuously improving this system, but as we improve it, recurring problems appear through a diverse volume of cases (Lee, Geoffrey A., 1977).

According to Jim Powell, author of America's First Great Champion for Liberty and Peace, historical fraudulent schemes date back to the time of Philip Ford in the 1700's; At the time Philip Ford embezzled large sums from the profitable estates owned by William Penn by means of getting Penn to sign a deed that would then transfer Pennsylvania to Mr. Ford. This scheme resembles patterns that still happen today and have led to an increase in accounting fraud throughout the years (Powell, n.p.)

Darlene and Charlene Corley were twin sisters from Lexington, South Carolina. Charlene worked at the South Carolina budget and control board while Darlene was a school teacher. In 1991 they both decided to open up their own small hardware store C&D Distributors. C&D Distributors LLC, was a registered government contractor with the Department of Defense which supplied hardware components, plumbing fixtures, electronic equipment and various other items to various military installations worldwide. In 1993 they began distributing hardware to the military; AKA the Department of Defense.

In July of 2000, there was an accounting error in the shipping costs which had been paid. They received five thousand dollars and at first weren't sure from where it came from but as soon as they figured it out that it was due to a loophole in the Department of Defense's automated payment system, they leveraged the situation. The Department of Defense had been using a system that had been automatically accepting shipping expenditures, it is known as the Defense Finance & Accounting Service (DFAS). It is the payment service center of the Department of Defense based in Columbus, Ohio and controls invoices submitted by government contractors for shipping costs paid electronically by DFAS. The sisters found out about this system and were able to charge any amount they wanted for shipping and the Department of Defense would pay for it. They were submitting bids and inflated shipping costs for those items. At this time the military was at war, supplying our soldiers as fast as they could, approving all costs that were needed; as in this case for bolts and screws. Shipping charges of tens of thousands of dollars eventually increased into hundreds of thousands of dollars. In all, they submitted almost seventy-two million dollars in fraudulent shipping costs and a little over twenty million were paid. With their lucrative scheme they bought several beach

houses, matching Mercedes cars, and took lavish vacations. They even opened a Nestle Toll House franchise called Dough and Cookie LLC.

The scheme was uncovered when the sisters sent two invoices for the same contract. The system “kicked it out” which led to further review and discovery that the charge shipping charge for two lock washers that were nineteen cents each was nearly a million dollars. At that time, when both Charlene and Darlene Corley realized the Department of Defense found out about their scheme, the sisters tried to mend the situation by paying back four and a half million dollars, sending the message that they will repay their debts. Investigators came to see Darlene, where she asked them to let her gather her thoughts and papers and to return the following day. However, Darlene chose instead to commit suicide. Charlene, left to defend herself, stated that her sister had been in charge of the entire operation. However, it was noted that “Charlene Corley was the president of the company, she was the managing partner and she was the designated contact for the Department of Defense.” Hence this case concluded that Charlene was actually in charge. On August 16th of 2007, Charlene Corley pleaded guilty for wire fraud and money laundering. It was looked at as an anti-American crime, taking money away from our soldiers and our country. It ended with Charlene being sentenced to six and a half years in prison.

“Fighting fraud has become an escalating war. Even those firms with the most advanced tools and processes to detect and prevent fraud feel like they are falling behind. The technical advancement and globalization of fraud will continue to provide new challenges to a firm’s ability to manage fraud (Ness, n.p.)” It is clear that numerous firms have faced instances of accounting fraud since the 13th century and this highlights the need for Embedded Audit Module and budgetary controls to prevent fraud before-the-fact. In summary, the main question is: what particular methods might have been implemented to prevent fraud like the one in the Charlene Corley Case?

METHOD: EMBEDDED AUDIT MODULES

Fraud has become prevalent in society (AccountingWeb.com, n.p.). One methodology that is used in this escalating war involves Embedded Audit Modules, which is a topic in embedded controls inserted into a system. These types of controls can be helpful to organizations by reducing costs, making response times quicker, avoiding unnecessary business exposures and making multiple tasks more efficient (Turner and Owghoso, 2009). “By continuously monitoring core business processes, via embedded controls and mathematical modeling, you may locate material errors in real-time/run-time, strengthen the control environment, and manage down business risks (Turner and Owghoso, 2009). “ These points of embedded controls are impressive elements that can be used for fraud prevention today with the application of their quick response time (Kneer, n.p.).

“Embedded controls, designed to prevent and detect fraud can be automatically reported in real time leveraging a predetermined work flow for investigation and remediation (Ibid.)” Having embedded controls may have impacted on the criminal act involved in the Charlene Corley case. Even though embedded controls were used to detect and prevent fraud in the Corley Case they were developed only enough in this case to prevent the situation from escalating. In this case, shipping costs were paid without any indication that fraudulent actions were in the making. In the case hearing, the judge had said “Miss Corley was stealing from the Department of Defense during a nine year time period, and the majority of that time period this country was at war... And, as you know, the Department of Defense's mission is to protect this country, to preserve our national security. We had soldiers in Iraq and Afghanistan risking their lives for the Department of Defense and to preserve our freedom in this country and she was stealing \$21 million from that agency.” This clearly implies that embedded controls require improvements, especially given this time when everyone was very concentrated in the war and was not able to give their full attention to the charges being processed.

A particular embedded control segment mainly relevant to the Corley case is Embedded Audit Modules (EAM). “EAMs are software applications embedded in host systems or linked to host systems to externally monitor such systems. EAMs are applications that continuously monitor flows of transactions, identify transactions that match certain pre-determined integrity constraints and, in the event of a constraint violation, alert the auditor and copy the transaction data to a file (Debreceeny, Glen, Ng, Siow-Ping Lee, and Yau, n.p.)” Since EAMs are continuously monitoring flows of transactions they make for a valuable auditing tool. “Early examples of EAMs were implemented in proprietary accounting information systems and production systems(*ibid*).” In the Corley case the Department of Defense used the aforementioned DFAS which automatically accepted shipping costs. This system could have been strengthened by employing Embedded Audit Modules which would have connected with the system to help externally monitor the enduring course of transactions.

EAMs have certain characteristics including “an end-user environment that allows the auditor to establish a set of queries to test transaction integrity constraints either from a pre-defined suite of queries, the modification of the attributes of pre-defined queries, or by the creation of new queries by the construction of simple scripts.” EAMs also permit the recording of transaction details which can then be reported electronically if a violation or query is observed. In the DFAS system there could have been EAM queries to allow some form of notification of violations that may be uncovered in the transaction that the system otherwise accepts as customary.

In an article by Daniel Draz, “According to the Institute of Internal Auditors (IIA), “responsibility for the system of internal control within a typical organization is a shared responsibility among all the executives, with leadership normally provided by the CFO.”” (Draz, n.p.) This informs that a segregation of duties should be assigned, to monitor from time to time the processes of the system being used by the Department of Defense. Moreover, “An effective notification system operates over a central server, delivers event messaging to predefined employees in “real time,” as the event occurs, and is sent directly to the employees and their smart devices. This level of event notification ensures that the people who need to know about an incident are made aware in a timely manner and fosters immediate and unified response as required (Draz, n.p.)” This is a system that could have helped prevent fraud during the arising active transactions in the Corley case.

In addition to improving on creating more queries in a company’s system and creating Embedded Audit Modules, another factor that is included in the embedded control process is the point of segregating duties. Draz’s article states that, “One way to strengthen internal controls is by improving the communication process”. Another point made was to “include communication to employees regarding increased awareness, correct handling processes and policy adherence. It may simply be that employees performed as expected under the circumstances but there were insufficient internal control policies in place to guide their behavior. Lessons learned here will strengthen internal controls through the creation of new ones. “Since communication is such a large issue in embedded controls there shouldn’t be one person or system to have sole authority over all transactions without appropriate sign off processes and differing levels of management approval.” Draz emphasizes that “a lack of proper segregation of duty in company policies are most often the root cause of many fraud and theft events in companies without strong internal controls in this area.” Having more people overlooking activities thought out a business can help detect fraud more easily at the time of the act, which could’ve been used in the time of the Corley case when the DFAS system had total authorization.

Embedded Audit Modules may have prevented the fraud in this case by having alerts sent that notify users of violations being attempted to be processed in certain transactions. With these internal controls there might also have been a segregation of duties to ensure that no specific individual can control both the recording function and the procedures relative to processing the transaction. The DFAS system did both of

these on its own without any other sources to overlook its processes. Besides using Embedded Audit Modules and other internal controls, another form of a detective control is Budgetary controls..

METHOD: BUDGETARY CONTROLS

A budget is defined as a formal written statement of management's plans for a specified future time period, expressed in financial terms. According to Wiley's Managerial Accounting book it is explained that a budget, "provides a basis for performance appraisal (variance analysis). A budget is basically a yardstick against which actual performance is measured and assessed. Control is provided by comparisons of actual results against the budget plan. Departures from the budget can then be investigated and the reasons for the differences can be divided into controllable and non-controllable factors (Weygandt, Kimmel, and Kieso, n.p.)."

In an article about budgetary controls, the budget evaluation process was described as, "During the year the management accountant will prepare statements, as quickly as possible after each operating period, in our example, each quarter and setting out the actual operating costs against the budgeted costs. This statement will calculate the difference between the 'budgeted' and the 'actual' cost, which is called the 'variance' (FAO)."

The benefits of budgeting involve: planning ahead by formalizing goals on a recurring basis, creating definite objectives for evaluating performance at each level of responsibility, constructing the budget to act as an early warning system for potential problems before they get out of hand, using it to facilitate the coordination of activities within a business, build correlated goals of each segment of the company objectives which leads to an improvement in management awareness and to motivating personnel by applying a sense of achievement for acquired money saving goals. All these concerns represent points that could have been used during the time of the Corley case. The Department of Defense could have used a budget in order to achieve all these benefits. "The audit logic in this example is check for significant variances in the purchase price against the standard prices in a particular period (Debreceeny, Glen, Ng, Lee, and Yau, 2005)." This check against variances and standard prices could've been seen if a budget had been established in the DFAS system which controlled shipping expenditures it would have been easier to notice the large variance beforehand, preventing any other transactions from occurring before someone would verify historical recordings in the budget.

A cash budget is a specific type of budget limiting cash for a certain goal. It is thought of as a cash plan for a defined period of time. It summarizes monthly receipts and payments. Hence, it highlights monthly surpluses and deficits of actual cash. Its main uses are: to maintain control over a firm's cash requirements, e.g. stock and debtors; to enable a firm to take precautionary measures and arrange in advance for investment and loan facilities whenever cash surpluses or deficits arises; to show the feasibility of management's plans in cash terms; to illustrate the financial impact of changes in management policy, e.g. change of credit terms offered to customers (Debreceeny, Glen, Ng, Lee, and Yau, 2005)."

Creating a budget might have prevented this scheme from developing. A budget for shipping would most likely have exceeded allocations after the first few fraudulent transactions and would have been noticed within the first year of this case. Budgeting, as a method for corporations to track and control all different types of expenditures being used frequently all through business activities, may have positive implications on situations such as the Corley case.

CONCLUSION

In summary, the methods discussed above might have provided both preventive and proactive approaches to addressing fraudulent activities such as those present in the Corley case. Embedded Audit Modules may establish fraud, for tasks done on an everyday basis in a company, by indicating any abnormal variances.

This is an easy way for auditors and managers of a company to identify any red flags raised in the system. Companies might require there to be segregation among all duties being made to ensure better reliability. Companies might “maintain budgets and review them monthly, investigating all major variances.” Companies can accomplish this by using budgeting/ software can help eliminate one of the causes of fraud which includes manipulation of spreadsheets. One option would be to use the exception reporting in the software known as Calxa, to highlight large variances and then investigate the causes of them (Calxa.com, n.p). Budgets are overall a great method and inexpensive for all businesses to use as a foundation for preventing fraud before the fact.

In the hearing Corley was told that “people will remember for years to come the woman from Lexington who got a million dollars for shipping a 19-cent washer.” This is the main issue she will have to think about, as regret, for the rest of her life. This could have been prevented before it escalated to that point, where she charged almost a million dollars shipping. Embedded Audit Modules and budgets could have all prevented the fraudulent activity of Charlene Corley from intensifying the sum.

In conclusion, each company might use at least one detective and preventive control in their business in order to have some underlying basis of fraud prevention. Corporations can determine what method might be best; either underlines embedded controls like the Embedded Audit Modules or embedded controls with creating budgets. An emphasis on the role of audits can be established to speculate any variances in costs throughout all aspects; creating a foundation approximating how much is okay to be spent of all expenditures. These procedures can save corporations a substantial amount of money if used for establishing detective and preventive controls, comparatively to the costs associated with fraud. It had been noted, by Calxa (budget software producer), “Businesses who do not take preventative actions could be exposed to a greater risk.” Businesses of any sort can get damaged for bountiful sums of money from schemes like the Corley case.

FINANCIAL ASPECTS OF DETERMINING OPTIMAL OCCUPANCY FACTOR (RATE) FOR HOTELS BASED ON PROBABILISTIC ANALYSIS

Chandrasekhar Putcha, California State University, Fullerton, CA

Brian Sloboda, US Department of Labor, Washington, D.C.

Viswanath Putcha, Northeastern University & Researcher, Boston, MA

Mohammadreza Khani, California State University, Fullerton, CA

ABSTRACT

This paper is based on the application of principles of probability theory to economic data as related to hotel industry. It is well known that the hotels want to make profit. Hence, hotels would like to achieve the highest occupancy factor (rate) as possible. The study done till now used variables such as hotels in operation, room nights available, room nights sold, hotel occupancy rate, hotel room price, actual revenue per room, and total revenues. In this paper, a different approach is used to address the same problem. The new model uses only 3 independent variables. These variables are total number of rooms in the hotel, the rooms sold on a particular night and the actual month sold. The data is used has been collected for two hotels. In one hotel, the daily data is available (for the entire 365 days) while only the average monthly data is available for the second hotel. The data collected is used in two ways. One is to fit an appropriate probabilistic density function and then calculate the probabilities of various levels of occupancy factors. The second is to establish a functional relationship between the occupancy factor and the temperature. Conclusions are then drawn.

KEYWORDS: Quantitative methods, density function, normal distribution, probability, chi-square test

INTRODUCTION

As stated earlier, the study done till now used variables such as hotels in operation, room nights available, room nights sold, hotel occupancy rate, hotel room price, average revenue per room, and total revenues (Fullerton et al; 2013) wherein data is taken primarily from Source Strategies, 2012) to address this problem.

LITERATURE REVIEW

Research work has been done in the past in this area (Fullerton et al., 2013). Choy (1985) provides forecasted and actual values of the hotel occupancy rate in Hong Kong. Similarly, there are other notable papers in this direction (Fullerton, 2001; Kimes, 1999). Brannas and Hellstrom (2002) and Kimes (1999) developed model for forecasting hotel-industry performance and accuracy in hotels. Law (1998) developed model for predicting room occupancy rate forecasting using a neural network approach. Similarly, useful information about forecasting of hotel occupancy can be obtained from (Rajopadhye, 2001; Schwartz and Cohen, 2004; Yuksel, 2007). Similar interdisciplinary applications of the principal of probability and statistics have been verified by Putcha and Liu (2013).

SCOPE OF THE WORK

In this paper, a different methodology is used to address the same problem. A mathematical model is developed as part of this study to calculate the occupancy factors for couple of hotels for various threshold values based on the room data collected for hotels. The study is done in two phases. In phase I, an appropriate density function is derived based on the room data for hotels. The adequacy of this density function is checked for both hotels using chi-square test. Then, the probability of occupancy rate reaching various threshold values is then calculated, again for both hotels. In phase II, a functional relationship is established between occupancy rate and temperatures. This is done to study the effect of various seasons on the occupancy rate. The adequacy of this equation is then checked using the correlation coefficient and standard error of estimate. The correlation coefficient should be at least equal to 0.8, while the standard error of estimate ($s_{y/x}$) should be less than the standard deviation of the dependent variable y (s_y) where y is the occupancy factor. The adequacy of the chosen probability distribution is decided based goodness-of-fit tests available in literature. One of these tests is the chi-square test (Ang and Tang, 2007). A significance level of 5% is chosen to start with. Probabilities of various occupancy rates are then calculated for on acceptable threshold values of 0.8, 0.85 and 0.9 because while 100% occupancy factor is desirable from the point of view of the hotel, it is almost impossible to achieve in practice. In addition, a regression analysis is estimated to get a function relation between the dependent variable - occupancy factor and the independent variables - the total rooms, rooms sold, and the price of each room. This equation is then used to find the optimum values of independent variables that will give the highest occupancy rate.

This research is done in two phases, Phase I and Phase II and the details are given below:

Phase I

1. Collect the data for rooms from various hotels. (Fullerton Marriott at California State University and Willow Tree Lodge Hotels.)
2. Calculate the occupancy rate of rooms.
3. Derive the chosen probability density function from visual observation and check the adequacy for the occupancy rate using chi-square test (Ang & Tang, 2007; Kreyszig., 2011). The steps are stated below:
 - a. Get the minimum and maximum value of the occupancy rate.
 - b. Divide the room data into appropriate number of divisions.
 - c. Get the theoretical relative and cumulative frequency and plot the histogram and density function.
 - d. Divide the data into appropriate number of divisions and get number of samples falling in that range. This gives n_i values for each range.
 - e. Calculate corresponding theoretical frequency for the assumed distribution (based on visual observation) from standard expressions available in literature (Ang & Tang, 2007; Kreyszig, 2011). This gives e_i values for each range.
 - f. Get the sum of $(n_i - e_i)^2 / e_i$ values for each range using the following expression

$$\chi^2 = \sum_i (n_i - e_i)^2 / e_i \quad (1)$$
 Where i goes up to N , where N represents number of divisions into which the collected room data has been divided.
 - h. Determine the solution of the following equation

$$P(\chi^2 \leq c) = 1 - \alpha \quad (2)$$
 where α is the significance level. If χ^2 obtained is less than c , then, the chosen distribution from visual observation is correct. c is the value of the appropriate χ^2 distribution at the cumulative probability.
 - i. check the validity based on the using chi-square test.

Phase II

In this phase, a functional relation is derived between occupancy rate and the average temperature for that month using the concepts of regression analysis (Chapra and Canale, 2015). A linear equation is fitted as follows:

$$OR = a + b(T); \text{ in which OR is Occupancy rate and T is temperature} \tag{3}$$

The values of a and b are obtained from

$$a = \overline{OR} - b(\overline{T}) \tag{4}$$

where \overline{OR} and \overline{T} are the mean values of OR and T

$$b = \frac{n \sum OR_i T_i - \sum OR_i \sum T_i}{n \sum T_i^2 - (\sum T_i)^2} \tag{5}$$

(OR_i, T_i) is a set of paired observations and n is number of total observations

The adequacy of this fit is checked from the correlation coefficient (r) and the standard error of estimate (S_{OR/T}). The correlation coefficient is given as

$$r = \frac{n \sum OR_i T_i - (\sum T_i)(\sum OR_i)}{\sqrt{[n \sum T_i^2 - (\sum T_i)^2][n \sum OR_i^2 - (\sum OR_i)^2]}} \tag{6}$$

The standard error of the estimate is given as,

$$S_{OR/T} = \sqrt{\frac{S_r}{n-2}} \tag{7}$$

where

$$S_r = \sum_{i=1}^n (OR_i - a - bT_i)^2 \tag{8}$$

In this study instead of OR, a derived parameter called ANORM (Average number of occupied rooms per month) which is similar to OR is used that has larger probability values when plotting the pdf (probability distribution function).

RESULTS

Data from two sets of hotels were obtained. The probability density functions and histograms are shown in Figure 1 and Figure 2. The chi-square test values are shown in tables 1 and 2 for two hotels. The values of probabilities of OR >= various threshold values are shown in Tables 3 and 4.

Table 1: Results of the Chi Square Test for the Fullerton Marriott Hotel at California State University

xj	Frequency	Cumulative Frequency	Relative Frequency ~f(x)	φ((xj-μ)/σ)	ej	bj	(bj-ej)^2/ej
143.03 - 157.78	1	1	0.08	0.0046 - 0.0488	0.5862	1	0.29215
157.78 - 172.53	0	1	0.00	0.0488 - 0.2406	2.8867	0	2.88667
172.53 - 187.25	6	7	0.50	0.2406 - 0.5968	7.1620	6	0.18853
187.25 - 202.03	5	12	0.42	0.5968 - 0.8847	10.6162	5	2.97106
						Σ	6.33841

We choose α=%1. Since the number of intervals, K=4 and we estimated r=2 parameters and with K-r-1=1 degrees of freedom, We find c=6.63 as the solution of P(χ² <= c) = %99. Since based on the Table 1 χ²

$=6.33841 < c=6.63$, we accept the hypothesis and results satisfied the chi-square test indicating that this hotel data follows normal distribution.

48	0.201358
54	0.068156

Table 5 and Table 6 show the variation of dependent variable occupancy rate (OR) with temperature (T) for the two hotels.

Table 5: Fullerton Marriott Hotel at California State University

	Temperature (T)	Occupancy Rate (OR)
January	54.7	174.71
February	56.4	192.25
March	57.2	196.61
April	60.1	182.47
May	63.7	179.68
June	68	195
July	73.5	202.03
August	73.9	200.38
September	72.1	143.03
October	66.7	176
November	60.4	174.3
December	55.6	184.93
$\mu=$		183.4492
$\sigma=$		15.49898

Figure 1: Variation of OR with temperature for Fullerton Marriott Hotel

Table 6: Willow Tree Lodge Hotel

	Temperature (T)	Occupancy Rate (OR)
January	54.7	37.5
February	56.4	36
March	57.2	48.2
April	60.1	33.8
May	63.7	37.5
June	68	42.6
July	73.5	48.2
August	73.9	54
September	72.1	31.7
October	66.7	39.1
November	60.4	38.6
December	55.6	43.7
	$\mu =$	40.3
	$\sigma =$	9.19

Figure 2: Variation of OR with time for Willow Tree Lodge Hotel

Adequacy of the fitted equation (between Temperature and Occupancy Rate)

This is checked using the two standard adequacy tests available in literature (Ang and Tang, 2007) - the correlation coefficient (close to 1.0) and the standard error of estimate ($S_{OR/T} < SOR$).

Fullerton Marriott Hotel at California State University

$$S_{OR/T} = \sqrt{\frac{2882.53}{12-2}} = 16.97$$

$$S_{OR} = \sqrt{\frac{2882.622}{12-1}} = 16.19$$

$$r^2 = \frac{2882.622 - 2882.53}{2882.62} \approx 0$$

$$r = 0$$

$S_{OR/T} > S_{OR}$: The linear regression is not adequate for the data for Fullerton Marriot Hotel.

Willow Tree Lodge Hotel:

$$S_{OR} = \sqrt{\frac{479.62}{12-1}} = 6.60$$

$$S_{OR/T} = \sqrt{\frac{434.67}{12-2}} = 6.59$$

$$r^2 = \frac{479.62 - 434.67}{479.62} \approx .99$$

$$r = .99$$

In this case, since $S_{OR/T} < S_{OR}$ and r is close to 1, the linear regression is adequate fit for Willow Tree Lodge Hotel.

CONCLUSIONS

It is seen from the results obtained on the limited data of hotels that the random variable Occupancy Rate (OR) of one of the hotel followed normal distribution; not for second hotel. Further investigation is needed to determine the exact distribution. It has also been seen from the results that the occupancy rate is a linear function of temperature for Willow Tree Lodge Hotel while it is not for Fullerton Marriott Hotel. This implies that for the Willow Tree Lodge Hotel, there is very little seasonal effect on the occupancy rate. On the whole, the statistical tools have been applied to hotel industry. Additional factors such as the location of the hotel, the crime factor, and the financial situation of the people in the area need to be considered to develop a refined model and arrive at more realistic results.

GLOBAL RISK FACTORS ASSOCIATED WITH OCCUPANCY FACTOR IN HOTELS

Chandrasekhar Putcha, California State University, Fullerton
Laura Liu, California State University, Fullerton

ABSTRACT

This paper is an extension of previous research (Putcha et al., 2015), dealing with financial determinants of optimal occupancy factor for hotels using the principles of probability theory. The previous paper by the first author of this paper uses the risk concepts for two hotels wherein normal distribution has been used as probability density function to describe the random behavior of the occupancy factor (random variable in this study). In this study, uniform distribution is also studied in addition and the results are compared. This paper is also interdisciplinary research paper. To determine a risk value for a particular event, the event has to be first formulated as a mathematical model for any given limit state. In this work, a mathematical equation is developed between the occupancy factor - a dependent variable and other independent variables such as the geographic zone, the financial status of the people near the vicinity of the hotel, number of rooms in the hotel and so on. Risk factors associated with occupancy factors less than certain threshold values are calculated. Risk factors associated with occupancy rates will be calculated for various standard hotels.

JEL: C1

KEYWORDS: Density Function, Normal Distribution, Uniform Distribution, Probability, Chi-Square Test

INTRODUCTION

The work reported in this paper is reported in two phases. Phase I deals with collection of data from hotels and analyzing it. Analysis entails plotting the relative frequencies of hotel data, establishing a probability density function (pdf), and checking its adequacy through chi-square test unlike the study done earlier (Putcha et al; 2015) where only normal distribution was considered. Phase II deals with establishing a function relation between the room occupancy for hotel and the temperature to study the seasonal effect. The probability values for normal distribution are calculated using the two methods of estimation of parameters. One method is traditional method of moments and the other is method of Maximum Likelihood Estimate (MLE). No significant difference is obtained in the results.

LITERATURE REVIEW

Research work on hotel room occupancy rate has been done in the past in this area (Fullerton et al., 2013). Choy (1985) provides forecasted and actual values of the hotel occupancy rate in Hong Kong. Similarly, there are other notable papers in this direction (Fullerton, 2001; Kimes, 1999). Brannas and Hellstrom (2002) and Kimes (1999) developed model for forecasting hotel-industry performance and accuracy in hotels. Law (1998) developed a model for predicting occupancy rate with neural network approach. Similarly, useful information about forecasting of hotel occupancy can be obtained from (Rajopadhye, 2001; Schwartz and Cohen, 2004; Yuksel, 2007). Similar interdisciplinary applications of the principal of probability and statistics have been reported by Putcha and Liu (2013).

METHODOLOGY

Scope of The Work

A mathematical model is developed as part of this study to calculate the occupancy factors for couple of hotels for various threshold values based on the room data collected for hotels. The study is done in two phases. As said earlier, in phase I, an appropriate density function is derived based on the room data for hotels. The adequacy of this density function is checked for both hotels using chi-square test. In phase II, a functional relationship is established between occupancy rate and temperatures. This is done to study the effect of various seasons on the occupancy rate. The adequacy of this equation is then checked by using the correlation coefficient and standard error of estimate. The correlation coefficient should be at least equal to 0.8, while the standard error of estimate (sy/x) should be less than the standard deviation of the dependent variable y (sy) where y is the occupancy factor. The adequacy of the chosen probability distribution is decided based goodness-of-fit tests available in literature. One of these tests is the chi-square test (Ang and Tang, 2007). A significance level of 1%- 5% is chosen to start with. Probabilities of various occupancy rates are then calculated for an acceptable threshold values of 0.8, 0.85 and 0.9 This is because while 100% occupancy factor is desirable from the point of view of the hotel, it is almost impossible to achieve in practice. The concept of regression analysis is used to get a function relation between the dependent variable -occupancy factor and the temperature. The analysis of this equation will indicate the seasonal effect on the occupancy factor.

Details of Research Study

The details of the actual research study are discussed below.

Phase I: The detailed steps for probabilistic analysis are explained by (Putcha et al, 2015; Kreyszig, 2011).

Phase II : In this phase, a functional relation is derived between occupancy rate and the average temperature for that month using the concepts of regression analysis (Chapra and Canale, 2015). A linear equation is fitted as follows:

$$OR = a + b (T); \text{ in which OR is Occupancy rate and T is temperature} \quad (3)$$

The values of a and b are obtained from

$$a = \overline{OR} - b(\overline{T}) \quad (4)$$

where \overline{OR} and \overline{T} are the mean values of OR and T

$$b = \frac{n \sum OR_i T_i - \sum OR_i \sum T_i}{n \sum T_i^2 - (\sum T_i)^2} \quad (5)$$

(OR_i , T_i) is a set of paired observations and n is number of total observations

The adequacy of this fit is checked from the correlation coefficient (r) and the standard error of estimate ($s_{OR/T}$). The correlation coefficient is given as

$$r = \frac{n \sum OR_i T_i - (\sum T_i)(\sum OR_i)}{\sqrt{[n \sum T_i^2 - (\sum T_i)^2][n \sum OR_i^2 - (\sum OR_i)^2]}} \quad (6)$$

The standard error of the estimate is given as,

$$S_{OR/T} = \sqrt{\frac{S_r}{n-2}} \tag{7}$$

where

$$S_r = \sum_{i=1}^n (OR_i - a - bT_i)^2 \tag{8}$$

In this study instead of OR, a derived parameter called ANORM (Average number of occupied rooms per month) which is similar to OR is used that has larger probability values when plotting the pdf (probability distribution function).

RESULTS

The analysis of data obtained from two hotels is done using two oft used distributions – normal and uniform distribution. The probability density functions and histograms are shown in Fig. 1 and Fig. 2. The chi-square test values are shown in tables 1 and 2 for two hotels. The values of probabilities of OR >= various threshold values are shown in Tables 3 and 4. Unlike in the paper (Putcha et al., 2015), finer model is considered in this study for Willow Tree Lodge hotel and both normal and uniform distribution are considered.

Table 1: Results of the Chi Square Test for the Fullerton Marriott Hotel at California State University (Putcha et al.; 2015)

						Σ	6.33841

We choose $\alpha=1\%$. Since the number of intervals, $K=4$ and we estimated $r=2$ parameters and with $K-r-1=1$ degrees of freedom, we find $c=6.63$ as the solution of $P(\chi^2 \leq c) = 99\%$. Since based on the Table 1, where, $\chi^2=6.33841 < c=6.63$, we accept the hypothesis and results satisfied the chi-square test indicating that this hotel data follows normal distribution (Putcha et al., 2015).

Figure 2: Willow Tree Lodge Hotel

Similar analysis of results as shown for Table 1 indicated that the data did not satisfy the chi-square test for normal distribution for Willow Tree Lodge Hotel. Hence, uniform distribution is also studied as a possible pdf for the hotel data. The calculation for chi-square test for the chosen pdf is shown in Table 3.

						Σ	123.83524

The uniform distribution also didn't satisfy the chi-square test. The seasonal effect on occupancy rate is studied and reported by Putcha et al. (2015). In that study, the probability values for $OR \geq$ certain pre-assigned practical threshold values are calculated. It was reported that Fullerton hotel there is little seasonal effect while in the case of Willow-tree lodge hotel the results were inconclusive. Table 5 and Table 6 show the variation of dependent variable occupancy rate (OR) with temperature (T) for the two hotels.

Table 4: Probability of occupancy rate for Fullerton Marriott Hotel at California State University with mean and standard deviation values of $\mu_{OR}=183.44$ and $\sigma_{OR}=15.49$ (Putcha et al., 2015)

Threshold Value	P(OR>threshold Value)
161.6	0.920722
181.8	0.542159

Table 5: Probability of occupancy rate for Willow Tree Lodge Hotel with mean and standard deviation values of $\mu_{OR}=40.31$ and $\sigma_{OR}=9.19$ (Putcha et al., 2015)

Threshold Value	P(OR>threshold Value)
48	0.201358
54	0.068156

Maximum Likelihood Estimate (MLE) of Normal distribution parameters: Since the room occupancy data for Fullerton Marriott hotel satisfied normal distribution (using method of moments), Maximum Likelihood Estimate for normal distribution is also calculated and the probabilities are calculated again. The parameters of normal distribution are estimated as follows (Rosenkrantz, 1997). A normal distribution density function can be expressed as follows

$$f(x, \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \exp\left(\frac{-1}{2} \left(\frac{x-\mu}{\sigma}\right)^2\right), -\infty < x < \infty \quad (9)$$

Taking logarithm of above equation one can get the following equation

$$L(x, \mu, \sigma^2) = \frac{1}{\sigma^n(2\pi)^{\frac{n}{2}}} \exp\left(\frac{-1}{2\sigma^2} \sum_{1 \leq i \leq n} (x_i - \mu)^2\right) \quad (10)$$

Taking logarithm from both sides of equation 1 we have,

$$\ln(L(x, \mu, \sigma^2)) = \ln\left(\frac{1}{\sigma^n(2\pi)^{\frac{n}{2}}} \exp\left(\frac{-1}{2\sigma^2} \sum_{1 \leq i \leq n} (x_i - \mu)^2\right)\right) \quad (11)$$

$$= -n \ln(\sigma) - \frac{1}{2\sigma^2} \sum_{1 \leq i \leq n} (x_i - \mu)^2 - \frac{n}{2} \ln(2\pi) \quad (12)$$

and then

$$\frac{\partial \ln L}{\partial \mu} = \frac{1}{\sigma^2} \sum_{1 \leq i \leq n} (x_i - \mu) = 0 \quad (13)$$

$$\frac{\partial \ln L}{\partial \sigma} = -\frac{n}{\sigma} + \frac{1}{\sigma^3} \sum_{1 \leq i \leq n} (x_i - \mu)^2 = 0 \quad (14)$$

and solution for the above equations will be

$$\bar{\mu} = \bar{x} \quad (15)$$

$$\sigma^2 = \frac{1}{n} \sum_{1 \leq i \leq n} (x_i - \mu)^2 \quad (16)$$

The results don't change much as the estimate of variance for MLE is (n-1)/n of the value obtained by method of moments (Rosenkrantz, 1997). This works out to be 0.995.

CONCLUSIONS

A mathematical analysis of hotel data is provided with respect to the important parameter of occupancy factor. Two sets of hotels are studied. For one of the hotels – Fullerton Marriott hotel, the data followed a normal distribution. In the case of the second hotel – Willow Tree Lodge Hotel both normal distribution didn't fit the probability density function (pdf). Further investigation of the data is needed to establish a correct pdf. In addition, concepts of regression analysis are used to develop a functional relation between occupancy rate (OR) and temperature for various months of the year to study seasonal effect. It is found that for Fullerton Marriot hotel, there is little seasonal effect. Conclusions could not be drawn for Willow Tree Lodge hotel. Additional investigation is needed in this aspect. The important thing is that a procedure for mathematical analysis of data for occupancy rate (OR) has been developed as part of this research. This analysis will help managers in the hotel industry as well as researchers in the field of hospitality industry.

TRADE OPENNESS AND ECONOMIC GROWTH EMPIRICAL INVESTIGATION

Rajeh Alragas, Swansea University, UK
T.K. Mishra, Swansea University, UK
Mamata Parhi, Swansea University, UK
Osman Ouattara, Manchester University, UK

ABSTRACT

This paper examines the impact of trade openness on economic growth using a new measure of trade openness proposed by Squallini and Wilson (2011). In contrast to the vast majority of the existing literature, the new measure of trade openness accounts for not only the country trade share of its GDP but also the relative size of the country's trade compared to the world trade in a given year. Using this innovative way to measure openness, the current essay examines the impact of trade openness on economic growth. We use data set includes 182 countries and covers the period from 1971 to 2011. We employ the Common Correlated Effects Mean Group (CCEMG) estimator developed by Pesaran (2006) and applied Cavalcanti et al. (2011) which takes into consideration the heterogeneity nature of world countries.

JEL: F140

KEYWORDS: Trade Openness, Economic Growth, Common Correlated Effects Mean Group (CCEMG) Estimator

INTRODUCTION

The relationship between openness and the level of national growth is a highly debated topic in the empirical literature. Although some recent advances reinforce a positive impact of openness on economic growth, it is still in doubt how robust are these estimates. A possible reason for this is the lack of a clear definition of the trade openness and how to measure it. Most studies use, as a proxy for trade openness, the ratio of the sum of export and imports (both goods and services) divided by the GDP at constant or current prices, often called 'trade openness ratio'. Our intention in this paper is to address the relation between trade openness with a new measure and economic growth. We use the Common Correlated Effects Mean Group (CCEMG) estimator to investigate the relationship and deal with the heterogeneity nature of world countries.

LITERATURE REVIEW

Most of the empirical studies on the link between openness and growth acknowledge a positive relationship in spite of the methodologies and trade openness proxies being used. For instance, Wacziarg (2001) finds that trade openness has a positive and significant impact on economic growth in a panel of 57 countries over the period 1970-1989. Similarly, Irwin and Tervio (2002) even after controlling for endogeneity, find a positive relationship between openness and growth in the interwar and the post-war periods. Vamvakidis (2002) uses historical data for the period 1870-1990 and concludes that the positive openness-growth relationship is rather a recent phenomenon, mainly driven by the world trade expansion. No significant positive relationship was found for the period before 1970, whilst the period 1970-1990 showed a significant positive effect of trade openness on economic growth. Furthermore, Salinas and Aksoy (2006) apply multivariate fixed effects estimations to examine the link during pre and post trade liberalisation periods and conclude that the post-liberalisation period saw an increase in the economic growth of about 1.2 percentage points higher than the pre-liberalisation period. Brunner (2003) uses a

dynamic panel data model to study the impact of trade openness on the level of national income and growth for a sample of 125 countries for the period 1960-1992. He concludes that trade openness has a significant large effect on the level of national income, but small and non-robust effect on income growth. Chang *et al.* (2009) draw a similar conclusion using data for 22 developed and 60 developing countries over the period 1960-2000. The authors also reveal that the positive association can be further significantly enhanced, if trade liberalisation is combined with flexible labour markets stable inflation rates and improved public infrastructure. Addressing the potential endogeneity of trade openness, Lee *et al.* (2004) investigate the relationship for a sample of 100 countries during the period of 1961 to 2000. The authors conclude that trade openness has an increased economic growth impact for these countries, although the effect is found to be small in magnitude. A more recent study by Sarkar (2008) employs a panel-data from 51 less developed countries LDCs for the period 1981-2002 and concludes that countries with higher trade shares tended to experience a higher real growth. Villaverde and Maza (2011), using globalisation as an indication of trade openness, also find a positive relationship over the period 1970-2005.

Measuring Trade Openness

The new trade measure, which this paper uses to address the relation between trade openness and economic growth, is the Composite Trade Share CTS, which is introduced by Squalli and Wilson (2011). The CTS include more information about the country's contribution to the global economy and its influential impact on the world economy. That is, the current study constructs and tests the CTS as a new measure of trade openness, and uses such a measure to re-examine the trade-growth nexus. The CTS can be presented as follows.

$$CTS_i = \frac{(X + M)_i}{\frac{1}{n} \sum_{j=1}^n (X + M)_j} \frac{(X + M)_i}{GDP_i}$$

The innovation in the CTS measure of trade openness arises from the fact that coherently incorporates two dimensions of a country's ties with the outside world. In particular, SW have considered not only the country's trade to GDP ratio but also its substantial interaction and interconnectedness with the rest of the world. More specifically, the CST includes two factors; the proportion of a given country's total income generated by international trade and the relative importance of that country's contribution in the world trade. According to SW, the CTS, in contradiction with the conventional measures of trade openness is able to capture the actual, rather than potential, trade flows.

METHODOLOGY

In order to examine the growth-openness nexus, the current study follows an augmented neoclassical production function, which is adopted in similar studies such as Frankel and Romer (1999), Thomas G.(2012), Herzer, D. (2013) and Sakyi D. *et. al.* (2012). In this context, we employ a bivariate model in which we regress the per capita growth of income on trade openness measured by the CTS. We start off with the following equation.

$$\ln Y_{it} = \alpha_i + \beta \ln x_{it} + \varepsilon_{it} \quad (1)$$

Where $t=1,2,\dots,T$ and $i=1,2,\dots,N$, Y real gross domestic product per capita, x denotes openness trade measured by the CTS, both variables are log-transformed, α_i the country-specific fixed effects, β parameter related to trade openness and ε_{it} an error term. Two estimation issues arise from the above model, namely parameter heterogeneity and cross-section dependence. In order to cope with these econometric issues, Pesaran (2006) proposed a new technique called Common Correlated Effects Mean Group (CCEMG). The CCEMG assumes random slope coefficients, which are independent and identically

deviate from their respective averages. According to Pesaran (2006), the core idea here is to filter the individual specific regressors with the help of cross-section aggregates and as the number of cross sections goes to infinity the differential effects of unobserved common factors will be trivial. To elaborate more on the CCEMG estimator, consider the following linear heterogeneous panel specification:

$$y_{it} = \alpha_i + \beta_i x_{it} + \varepsilon_{it} \quad (2)$$

Where β_i is country-specific parameter for country i . In order to address the cross-sectional dependencies, Pesaran (2006) assumes that the error term in Eq. (2) follows a multifactor structure defined as follows.

$$\varepsilon_{it} = \gamma_1 f_t + u_{it} \quad (3)$$

Where f_t is a $m \times 1$ vector of unobserved common effects, which are allowed to be serially correlated. In addition, Kapetanios et al., 2011 show that the f_t in the above equation could be stationary or non-stationary. They could even be correlated with trade openness, see Holly et al., 2010; Cavalcantiet al., 2011. The u_{it} term represents a country specific error and allowed to be weekly dependent across i and serially correlated over t . Since x_{it} are assumed to be correlated with unobserved effects f_t , it follows that

$$x_{it} = \eta_i + \xi_i f_t + v_{it} \quad (4)$$

Where ξ_i is a $k \times 1$ vector of factor loadings, and v_{it} is the error term, which is assumed to be identically and distributed independently of f_t and u_{it} . Finally, to obtain the CCEMG, one needs to have N country regression equations, each of which contains the cross-section average terms for y and x as follows.

$$y_{it} = \alpha_i + \beta_i x_{it} + b_{i0} \bar{y}_{it} + b_{i1} \bar{x}_{it} + \varepsilon_{it} \quad (5)$$

Where \bar{y}_{it} and \bar{x}_{it} are the cross-sectional averages and only serve as proxies for the common factors and may not have any interpretable meaning (see Pesaran, 2006). The coefficient of interest is computed as the simple average of the N countries:

$$\hat{\beta}_{CCEMG} = N^{-1} \sum_{i=1}^N \hat{\beta}_i \quad (6)$$

Thus, our estimator is just the average value of the country-specific slopes, which reflects the long-run relationship between trade openness and per capita income. According to Pesaran (2006), the short-run dynamics and their adjustment to the long run across countries are accommodated through the error term ε_{it} , which has a multifactor error structure as explained in Eq (3). Our model specification in Eq(2) can now be expressed with the multifactor error structure as follows:

$$\ln Y_{it} = \alpha_i + \beta_i \ln OPEN_{it} + b_{i0} \overline{\ln Y}_{it} + b_{i1} \overline{\ln OPEN}_{it} + \varepsilon_{it} \quad (7)$$

Where $\overline{\ln Y}_{it}$ and $\overline{\ln OPEN}_{it}$ are proxies for the unobserved common factors

Data

To perform a broad panel analysis of a large number of countries and over a long period, we use a balanced panel dataset containing 182 countries over the period 1971-2011. Our analysis is based on two variables extracted from the Penn World Table 8.0 provided by Heston et al. (2013). Trade openness is measured by the CTS as proposed by SW(2011). The per capita GDP measured in constant prices and in international dollar per person.

RESULTS

For the comparison of the results, we also compute the traditional mean group (MG) estimates of Eq. (2), which does not take account of cross-section dependence by assuming independent errors. Table (1) contains the results from MGCCE estimation accounting for both heterogeneity and cross section dependence present in the data. As the table shows these results indicate that trade openness has a significant and positive impact on GDP per capita. According to the results presented in Table (1), the long-run relationship between trade openness and the level of income is positive and highly significant in both estimators. However, we observe, on the one hand, that the mean coefficient β is much bigger in the CCEMG estimate than in the MG. Moreover, the CCEMG estimator has led to a significant reduction of cross-section dependence inherent in Eq. (2), and thus provides us with the true mean coefficient β . According to Table (1), the coefficient of openness that estimated by MGCCE is positive and statistically significant, which means a one percent increase in the CTS on average, a statistically significant increase in per capita income about 0.41 per cent.

Table 1: Estimates of the Long Run Impact of OPENNESS on GDP Per Capita Using Panel Heterogeneous Estimator MG And CCEMG

Dependent Variable : GDP Per Capita				
	MG	MG	MGCCE	MGCCE
openness	0.03** (0.008)	0.02** (0.01)	0.415*** (0.021)	0.403*** (0.02)
Trend	No	Yes	No	Yes
No. of Obs	7462	7462	7462	7462
No. of countries	182	182	182	182
CDtest statistic	151.4***		18.23***	

Note: Standard errors are reported in parenthesis. ***, **, *denote rejection of the null hypothesis at the 1%, 5% and 10% significance level, respectively. The CD test statistics are Pesaran (2004) CD test on the residuals of MG and CCEMG estimates.

CONCLUSION

The present paper investigates the dynamic relationship between Trade Openness and economic growth of 182 countries over the period 1970-2010. A new measure of trade openness is constructed following the approach developed by Squalli and Wilson (2011). For estimation purposes, we have employed heterogeneous panel cointegration techniques that are robust in the presence of non-stationarity, endogeneity and cross-section dependence, which offers more reliable results than conventional approaches. The main conclusions of the paper are that there is a significant long-run relationship between trade openness and economic growth.

THE EFFECT OF ACCOUNTING INFORMATION AND CORPORATE GOVERNANCE MECHANISMS ON DEBT COVENANTS- AN APPLIED STUDY ON FIRMS LISTED IN THE EGYPTIAN STOCK MARKET

Kamal El Din Mostafa El Dahrawy, Alexandria University
Mohamed Mohamed Abd El Ghany, Alexandria University
Osama Magdy Fouad Mohamed, Alexandria University

ABSTRACT

This study suggests a model for the effect of accounting information and corporate governance mechanisms on public and private debt covenants of firms listed in the Egyptian stock market. In particular, the model includes three main variables of accounting information: change in net cash flows from operating activities; change in earnings before extraordinary items; accounting disclosure levels and ten corporate governance mechanisms: board size; experience; meetings; independence; duality of chief executive officer (CEO), independence of audit committee; its size; its experience; the existence of big 4 auditors; number of blockholders. The research sample comprised of 66 observations of firms who issued bonds or were granted bank loans in the period from 2003 through 2013. The results of multiple regression analyses show the model is useful in explaining the changes in the design of debt covenants.

Keywords: Debt Covenants, Corporate Governance Mechanisms, Accounting Information, Private Debt, Public Debt

INTRODUCTION

Debt covenants play a vital role in mitigating agency problems those results from the conflict of interest between shareholders and creditors. Previous studies (e.g. Armstrong et al., 2010; Nikolaev, 2010; Gamba and Triantis, 2013) showed that the objective of debt covenants is to limit the management actions that increase the shareholders' equity at the expense of decreasing the value of external debts. Those covenants can take many forms such as: restrictions on dividends; working capital; merger activities; investments in other firms; additional debts; assets liquidation. The accounting information provided by the financial statements and financial reports plays an important role in the design of public and private debt covenants, as it enables creditors whether bondholders or banks to make credit decisions. There is no doubt that the provision of accounting information is not a goal by itself, but it should have useful information content. Prior studies had provided evidence that accounting information including cash flows, accounting profit, and accounting disclosure level can provide a strong explanation for the changes in the design of public and private debt terms to a great extent. Importance of cash flows for the lenders is highlighted in making their credit decisions. Cash flows indicate the extent of the project's ability to continue, and facilitates the prediction of future distributions and the repayment of loans and credit.

The bankruptcy of many big firms in the recent financial crisis creates an increasing need for high quality accounting information to reconstruct the confidence of investors in financial reporting. This can be done by enforcing corporate governance mechanisms. The relationships between corporate governance mechanisms and debt covenants design have been examined in prior research (e.g. Bradley and Chen, 2011; Jiang and Zho, 2011; Abubakar et al., 2012; Aldamen and Duncan, 2012; Chen, 2012; Fields et al., 2012; Francis et al., 2012; Mande et al., 2012) and found that the effective application of those mechanisms results in a decrease in debt covenants. There are discrepancies in the results of previous studies which dealt with the impact of corporate governance mechanisms on the private debt covenants, many studies have agreed that banks rely heavily on corporate governance mechanisms when designing

debt contracts, where the findings of these studies revealed that strong corporate governance mechanisms result in lower cost of debt indicating the existence of a negative significant correlation between the quality of corporate governance mechanisms and the imposition of debt covenants in private debt contracts. Hence, the research problem can be phrased in four questions as follows:

Does the change in net cash flows from operating activities affect the debt covenants that are imposed in the public and private debt contracts of the firms listed in the Egyptian stock market?

Does the change in net profit before extraordinary items affect the debt covenants that are imposed in the public and private debt contracts of the firms listed in the Egyptian stock market?

Does accounting disclosure level affect the debt covenants that are imposed in the public and private debt contracts of the firms listed in the Egyptian stock market?

Does corporate governance mechanisms affect the debt covenants that are imposed in the public and private debt contracts of the firms listed in the Egyptian stock market?

In this study, the researchers depend on three main theories: agency theory of covenants; contract theory; opportunistic theory. The objective of the study is to highlight the role of accounting information and corporate governance mechanisms in the interpretation of changes in the design of the debt covenants that are imposed in the public and private debt contracts of the companies listed in the Egyptian stock market. The importance of this study can be addressed along two aspects: the research can provide additional contribution to the accounting literature in general, and especially in Egypt, by presenting appropriate analysis of the Egyptian environment which has unique characteristics. Also, this study would benefit lenders (banks and bondholders) in making credit decisions. As they rely on accounting information and corporate governance mechanisms when designing the debt covenants that are imposed in the public and private debt contracts. This study contributed to the literature by constructing a comprehensive model for addressing multiple factors affecting the design of debt covenants measured by not only pricing terms (i.e. interest rate or cost of debt) but also non-price terms by making an index containing 109 terms.

Literature Review and Hypothesis Development

Prior studies can be classified into five categories as follows:

First: The effect of corporate governance mechanisms on public debt covenants. Many previous studies (e.g. Bhojraj and Sengupta, 2003; Klock et al., 2005; Skaife et al. 2006; Cremers et al., 2007; Robicheaux et al., 2007; Blom and Schauten, 2008; Bradley et al., 2008; Bradley and Chen, 2011; Chen, 2012) investigated the effect of corporate governance on public debt covenants, they agreed on the existence of a significant negative association between corporate governance mechanisms and public debt covenants. In addition, two of these studies (Bhojraj and Sengupta, 2003 and Skaife et al. 2006) found a significant positive association between corporate governance mechanisms and firms' credit rating. Also, Skaife et al. 2006 found a significant positive association between the number of blockholders and public debt covenants. Moreover, they found a significant positive association between the quality of earnings; working capital; accounting accruals and firms' credit rating. Finally, they found a significant negative association between the quality of earnings; working capital; accounting accruals and public debt covenants. Furthermore, the studies of Bhojraj and Sengupta, 2003 and Blom and Schauten, 2008 found a significant negative association between firm size and cost of debt. The researchers in previous studies show an agreement on the impact of corporate governance mechanisms on public debt covenants. The researchers argue that the bondholders rely very heavily on corporate governance mechanisms in the reduction of agency problems.

Second: The effect of corporate governance mechanisms on private debt covenants. Many previous studies (e.g. Baird and Rasmussen, 2006; Francis et al., 2006; Jiraporn and Kitsabunnarat, 2007; Chava et al., 2009; Ivashina et al., 2009;; Bagnoli et al. 2011; Jiang and Zho, 2011; Fields et al. 2012; Francis et al. 2012; AbuBakar et al., 2012;

Anantharaman et al., 2013) investigated the effect of corporate governance on Private debt covenants, they agreed on the existence of a significant negative association between corporate governance mechanisms and Private debt covenants. While the study of (Jiraporn and Kitsabunnarat, 2007) where found a non-significant association between corporate governance mechanisms and Private debt covenants.

Third: The effect of corporate governance mechanisms on public and private debt covenants Many previous studies (e.g. Day and Taylor, 1998; Chan-lau, 2001; Anderson et al., 2003; Anderson et al., 2004; Day and Taylor, 2004; Litov, 2005; Anderson et al., 2006; Davidson et al., 2006; Byun, 2007; Ellul et al., 2007; Funchal et al., 2008; Sarkar and Sarkar, 2008; Mcknight and Weir, 2009; Piot and Piera, 2009; Armstrong et al., 2010; Bozec and Bozec, 2011; Lorca and Ballesta, 2011; Mao, 2011; Aldamen and Duncan, 2012; Farooq and Derrabi, 2012; Frantz and Instefjord, 2012; Li et al., 2012; Mande et al., 2012; Ramly, 2013; Yu et al., 2013) investigated the effect of corporate governance on public and private debt covenants, they agreed on the existence of a significant negative association between corporate governance mechanisms and public and private debt covenants. Where the study Piot and Piera, 2009 found the presence of an independent audit committee makes no difference on the cost of debt, suggesting that financial reporting and accounting quality are not of prime interest to debtholders in the French setting. A study Li et al., 2012 found corporate governance mechanisms have less explanatory ability in the interpretation of the terms of Private debt covenants.

Fourth: The effect of cash flows on public and private debt covenants The researchers found there is a dearth very large in previous studies on the effect of cash flows on public and private debt covenants, which represents the contribution of researchers to present the effect of this variable on public and private debt covenants. Two previous studies (e.g. Begley and Freedman, 2004; Demerjian, 2011) found accounting-based covenants included in recent public and private debt contracts tend to focus more on cash flow numbers and less on balance sheet measures of leverage than in the past. The evidence presented here suggests that recently executed public and private debt covenants provide little incentive for managers to manipulate accounting numbers.

Fifth: The effect of accounting earnings on public and private debt covenants Many previous studies (e.g. Crabtree and Maher, 2005; Demerjian, 2007; Jiang, 2008; Li, 2010; Amiram, 2011; Hasan et al, 2012; Ismail, 2014) investigated the effect of accounting earnings on public and private debt covenants. Crabtree and Maher, 2005 found that the degree of predictability of a firm's earnings is positively associated with a firm's bond rating. Moreover, earnings predictability is also documented to be negatively associated with the offering yield. Importantly, bond rating classification accuracy is improved when specific measures of a firm's earnings predictability are added to a robust model. In addition, Demerjian, 2007 found that contracts of borrowers with positive earnings, high profitability, and low volatility earnings are likely to include covenants measured with earnings, such as coverage or debt to cash flow. Debt contracts of borrowers with losses, low profitability, and highly volatile earnings are likely to include covenants measured with shareholders' equity, such as net worth. Additionally, deals with revolving lines of credit are likely to contain leverage covenants, and those for borrowers with high levels of working capital are likely to contain current ratio covenants. Furthermore, Jiang, 2008 found that firms beating earnings benchmarks have a higher probability of rating upgrades and a smaller initial bond yield spread. Amiram, 2011 found that the positive relation between the accounting-based expected loss given default and contract terms is higher when probability of default, managerial entrenchment, or accounting information precision are higher. Moreover, Hasan et al, 2012 found that firms with more predictable earnings have more favorable loan terms, such as lower interest rates, longer maturities, and fewer covenants and collateral requirements. In addition, Ismail, 2014 found that profitable firms with growth options are likely to include financial covenants on their syndicated private debt Based on the above-mentioned discussion, the following main hypothesis can be developed:

H1: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the debts covenants in both public and private debt contracts. This main hypothesis can be subdivided into the following six detailed hypotheses: H1a: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the price terms measured by interest rate in the private debt contracts.

H1b: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the price terms measured by interest rate in the public debt contracts.

H1c: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the non-price terms in the private debt contracts.

H1d: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the non-price terms in the public debt contracts

H1e: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the price and non-price terms in the private debt contracts.

H1f: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the price and non-price terms in the public debt contracts.

DATA AND METHODOLOGY

The sample of the study is comprised of 66 observations of firms who issued bonds or were granted bank loans in the period from 2003 through 2013. It was divided into two categories; 35 firms issued bonds and 31 firms were granted bank loans. The research data were obtained from the annual disclosure book of the Egyptian stock exchange, National Bank of Egypt, Egypt for Information Dissemination (eg/ID). The researchers analyzed data depending on the statistical program SPSS, and we use the multiple regression analysis. The independent variables are: First, accounting information using the following indicators: Change in net cash flows from operating activities measured by:

$$\frac{\text{Net cash flows from operating activities of the Company (I) during the period (t)}}{\text{Net cash flows from operating activities of the Company (I) during the period (t-1)}}$$

Change in earnings before extraordinary items measured by:

$$\frac{\text{Net earnings before extraordinary items of the Company (I) during the period (t)}}{\text{Net earnings before extraordinary items of the Company (I) during the period (t-1)}}$$

accounting disclosure levels measured by the number of factors disclosed in the financial statement out of an index of 160 factor developed by Akhtaruddin, 2005. Second, corporate governance mechanisms using the following indicators: **1- Board Size:** score 1 (for good governance) if the size of a firm's board is less than the sample median, and 0 otherwise. **2- Board Experience:** score 1 (for good governance) if the board of directors of the company has experience of more than 10 years, and 0 otherwise. **3- Board Meetings:** score 1 (for good governance) if the number of meetings of the board of directors of the company more than 5 meetings in a year and 0 otherwise. **4- Board Independence:** score 1 (for good governance) if the proportion of independent directors executives from outside the company to the number of members of the

Board of Directors of more than or equal to 60%, and 0 otherwise. 5- Duality of Chief Executive Officer (CEO): score 1 (for good governance) if a firm's CEO is not the chair of the board and 0 otherwise. 6- Independence of Audit Committee: score 1 (for good governance) If the members of the audit committee completely independent board members, and 0 otherwise. 7- Size of Audit Committee: score 1 (for good governance) If the ratio of the number of members of the audit committee to the number of members of the board of directors fully greater than the median value for the sample of the study, and 0 otherwise. 8- Experience of Audit Committee: score 1 (for good governance) if the members of the audit Committee have experience of more than 10 years, and 0 otherwise. 9- The Existence of BIG 4 Auditors: score 1 (for good governance) if the auditor from the Big Four audit firms (KPMG; Ernst & Young; Deloitte; Price water house) and 0 otherwise. 10- Number of Blockholders: score 1 (for good governance) If decreased the number of blockholders, and 0 otherwise. Third, control variables using: A- Firm size: measured by calculating the natural logarithm of total assets. B- Leverage Ratio: measured by total liabilities / total assets. C- Credit Rating: score 1 if the credit rating of the firm is high.

The dependent variables are: a debt covenant this variable was measured by creating index contains 109 of the terms of public and private debt covenants were derivative from previous studies. This index is divided into six parts, including the following: (1) Companies that received loans from banks or the issuance of bonds are traded on the Egyptian stock market. (2) The structure of leasing commitments special structure. (3) Dividend commitments. (4) Pledges to sell assets. (5) Pledges for contributions issuing capital. (6) Pledges for issuing. The dependent variable was measured on the basis of the number of terms of the debt for each company separately and divided by the index of the debt covenants. Following is the formulation of the statistical models to test the hypotheses:

$$VPTIR_{(t)} = \beta_0 + \beta_1 \Delta CFO_{(t)} + \beta_2 \Delta ER_{(t)} + \beta_3 DL_{(t)} + \beta_4 CGM_{(t)} + \beta_5 SF_{(t)} + \beta_6 LEV_{(t)} \quad (1)$$

$$CPTIR_{(t)} = \beta_0 + \beta_1 \Delta CFO_{(t)} + \beta_2 \Delta ER_{(t)} + \beta_3 DL_{(t)} + \beta_4 CGM_{(t)} + \beta_5 SF_{(t)} + \beta_6 LEV_{(t)} + \beta_7 MDB_{(t)} + \beta_8 CRB_{(t)} \quad (2)$$

$$VNPT_{(t)} = \beta_0 + \beta_1 \Delta CFO_{(t)} + \beta_2 \Delta ER_{(t)} + \beta_3 DL_{(t)} + \beta_4 CGM_{(t)} + \beta_5 SF_{(t)} + \beta_6 LEV_{(t)} \quad (3)$$

$$CNPT_{(t)} = \beta_0 + \beta_1 \Delta CFO_{(t)} + \beta_2 \Delta ER_{(t)} + \beta_3 DL_{(t)} + \beta_4 CGM_{(t)} + \beta_5 SF_{(t)} + \beta_6 LEV_{(t)} + \beta_7 MDB_{(t)} + \beta_8 CRB_{(t)} \quad (4)$$

$$VDC_{(t)} = \beta_0 + \beta_1 \Delta CFO_{(t)} + \beta_2 \Delta ER_{(t)} + \beta_3 DL_{(t)} + \beta_4 CGM_{(t)} + \beta_5 SF_{(t)} + \beta_6 LEV_{(t)} \quad (5)$$

$$CDC_{(t)} = \beta_0 + \beta_1 \Delta CFO_{(t)} + \beta_2 \Delta ER_{(t)} + \beta_3 DL_{(t)} + \beta_4 CGM_{(t)} + \beta_5 SF_{(t)} + \beta_6 LEV_{(t)} + \beta_7 MDB_{(t)} + \beta_8 CRB_{(t)} \quad (6)$$

VPTIR_(t): The price terms measured by interest rate in the private debt contracts.

CPTIR_(t): The price terms measured by interest rate in the public debt contracts.

VNPT_(t): The non-price terms in the private debt contracts.

CNPT_(t): The non-price terms in the public debt contracts.

VDC_(t): The price and non-price terms in the private debt contracts.

CDC_(t): The price and non-price terms in the public debt contracts.

$\Delta CFO_{(t)}$: Change in Cash flows from operating activities.

$\Delta ER_{(t)}$: Change in earnings before extraordinary items.

DL_(t): Accounting disclosure Level.

CGM_(t): Corporate Governance Mechanisms.

SF_(t): Firm Size.

LEV_(t): Leverage of the Firm.

MDB_(t): Maturity debt bonds.

CRB_(t): Credit Rating bonds

RESULTS AND COMMENTS

The Kolmogorov–Smirnov test was used to test the normalization of sample data. The results of multiple regression analyses show the model is useful in explaining the changes in the design of debt covenants. We found the more the change in net cash flows from operating activities, change in accounting earnings,

accounting disclosure level and corporate governance mechanism level, the less the debts covenants in both public and private debt contracts. Banks rely heavily on the change in net cash flows from operating activities compared to bondholder when setting debt covenants in debt contracts. Bondholders depend greatly on the change in net earnings before extraordinary items compared to banks when setting debt covenants in debt contracts. Banks depend largely on the accounting disclosure compared to bondholder when setting debt covenants in debt contracts. Banks depend largely on the corporate governance mechanisms compared to bondholder when setting debt covenants in debt contracts. The more the firm size, credit rating and maturity bonds, the less the debts covenants in both public and private debt contracts. The more the leverage ratio, the more the debts covenants in both public and private debt contracts. Results Can Be Summarized As Follows:

Hypothesis	R ²	P-value
H1a: the more the change in net cash flows from operating activities, change in accounting earnings, accounting disclosure level and corporate governance mechanism level, the less the price terms measured by interest rate in the private debt contracts $VPTIR_{(t)} = \beta_0 + \beta_1 \Delta CFO_{(t)} + \beta_2 \Delta ER_{(t)} + \beta_3 DL_{(t)} + \beta_4 CGM_{(t)} + \beta_5 SF_{(t)} + \beta_6 LEV_{(t)}$	81.6%	0.0000009*

CONCLUDING COMMENTS

This study contributed to the literature by constructing a comprehensive model for addressing multiple factors affecting the design of debt covenants measured by not only pricing terms (i.e. interest rate or cost of debt) but also non-price terms by making an index containing 109 terms of non-price terms. The objective of the study is to highlight the role of accounting information and corporate governance mechanisms in the interpretation of changes in the design of the debt covenants that are imposed in the public and private debt contracts of the companies listed in the Egyptian stock market. We found that the model is useful in explaining the changes in the design of debt covenants.

INDUSTRY CHARACTERISTICS AND INDUSTRY-SPECIFIC VALUATION MODELS

Yanfu Li, Lincoln University

ABSTRACT

This study aims to improve the accuracy of estimated intrinsic value by the industry-specific valuation model. Since the different industries have their own unique characteristics, they should be valued by different valuation models. Thus, this study offers a comprehensive overview of the characteristics of financial, information technology and health care industries, and then identifies the appropriate industry-specific valuation models for each industry. As the features of firms may still vary greatly even within the same industry, this study further classifies each industry into several sectors according to the Industry Classification Benchmark. After that, a series of corresponding valuation models for each sector are recommended and ranked, detailed explanations for the model ranking are given for each sector. This study contributes to the literature of valuation methodology by identifying the corresponding valuation models for different sectors/industries. More accurate estimation of the intrinsic value can be expected as a result of more compatible valuation model.

JEL: G12, G14, C10

KEYWORDS: Industry Characteristic, Industry-Specific Valuation Method

INTRODUCTION

As a basic rule in the business valuation, the selected valuation model should be compatible with the characteristics of the business being valued in order to better estimate its intrinsic value. The “apples to apples” comparison offers the most defensible way to demonstrate what a business is worth. In valuation practice, the equity analysts prefer to focus on the general characteristics of firms within a specific industry, and then apply differing valuation models into different industries. However, the equity analysts did not reach a consensus about the model selection standard since choosing the industry-specific valuation models is one of the biggest challenges in business valuation.

In reality, the equity analysts have different valuation model preferences and choices for the same industry. Shahed et al. (2008) conducted a semi-structured interview with 42 UK sell-side investment analysts who specialized in different industries, the authors also conducted a content analysis on 98 equity research reports. Demirakos et al. (2004) carried out a similar content analysis on 104 equity reports across three different industries. Both studies conclude that equity analysts do have their own “favorite” models for a specific industry and these “favorite” models may not be the same. The authors further rank a series of absolute and relative models according to the equity analyst usage and preference across eight different industries. However, both studies offer little reasons to explain why a particular valuation model is appropriate for its corresponding industry, their model ranking is mainly based on the observed analyst usage. In addition, most of the existing studies tend to concentrate on the evaluation and comparison of different valuation model performance, there are very few studies to take into account the characteristics of industry or firm and the model compatibility. Thus our study concentrates on a range of commonly used valuation models for listed company, and identifies the appropriate industry-specific valuation models based on the industry characteristics. Three industries have been selected for the study, they are financial, information technology and health care.

CONCLUSIONS AND RECOMMENDATIONS

In today's valuation practice, apply different valuation models into different industries is already a common practice of many equity analysts. As a basic rule in the business valuation, the selected valuation model should be compatible with the characteristics of the business being valued in order to better estimate its intrinsic value. However, the equity analysts did not reach a consensus about the model selection standard. In reality, the equity analysts have different valuation model preferences and choices for the same industry. The unification of the selection standard for the industry-specific valuation models is necessary. Thus, this study offers a comprehensive overview of the characteristics of financial, information technology and health care industries, and then identifies the appropriate industry-specific valuation models for each industry. In particular, this study focuses on a range of commonly used valuation models include the multi-period absolute models and single-period relative models. Since the features of firms may still vary greatly even within the same industry, this study further classifies each industry into several sectors according to the Industry Classification Benchmark. After that, a series of corresponding valuation models for each sector are recommended and ranked, detailed explanations for model ranking are given for each sector.

Until recent, the majority of the existing studies tend to concentrate on the evaluation and comparison of different valuation model performance, there are very few studies that simultaneously take into account the characteristics of industry or firm and the valuation model compatibility. Thus, this study contributes to the literature of valuation methodology by identifying the appropriate valuation models for different sectors/industries. More accurate estimation of the intrinsic value can be expected as a result of more compatible valuation model. In addition to the three industries discussed by this study, further studies on other industries and their corresponding valuation models are necessary and meaningful.

EMPLOYER IMAGE (THE CASE OF LITHUANIA)

Greta Druteikiene, Vilnius University

ABSTRACT

Each organization tries to look as an attractive employer in society while forming their image. This way an organization obtains a competitive advantage, attracts and sustains best employees, this way ensuring their competitiveness and long term success. Tense situation in Lithuanian labor market, where there is a shortage of highly qualified specialists and long lasting emigration persists, partly occurred due to economic and financial crisis, but employers further exacerbated it through: inappropriate wage policies, unwillingness to pay attention to employees' social problems, professional development, layoffs and other reasons, which resulted in a loss of employee confidence in employers and weakening commitment to national organizations. Currently recovering economy signals that in a near future, Lithuanian organizations might face difficulties attracting talented employees and sustaining current employees. Thus, the aim of this article is to find out which Lithuanian companies are most attractive to employees, what features do they possess and which methods and techniques their attractiveness could be defined.

KEYWORDS: Employer's Image, Best Employers, Reputation

INTRODUCTION

As the lack of high-level specialists and managers develops in Lithuania, organizations face the problem in attracting talents and forming the perception of an organization as highly desirable workplace (Savickiene, 2005). Hence, a good specialist makes a decision where to work not only based on the job they would like to perform, but also on company or organization they would like to be a part of. In such cases, employers are unpleasantly surprised when they discover that not employers select employees, but employees choose them. Therefore, companies' top management must understand that candidates should be appropriately evaluated, their potential opportunities and possible benefits to an organization should be foreseen; moreover, they have to be able to attract selected people, in other words, to create an impression of desirable employer (Paulauskaite 2006; Druteikiene and Marcinskas, 2007). Thus, for each company that aims to become the best workplace, it is essential, first, to ascertain what features it should possess to compete successfully. Only with clearly defined criteria, it is possible to develop reliable strategy that enables a company to position itself in the market as an attractive employer (Paulauskaite, 2006).

Employer's Image: Theoretical Aspect

The definition of employer's image in scientific literature is close to the definition of organizational image. D. Lee (2006) states that great companies attract great people. If organization has a strong image in the market, it shall have strong employer image in the job market. If company is associated with quality, it will attract good employees, and vice versa (Paulauskaite, 2006). However, to become the best workplace, it is necessary to determine what features employer should possess to be perceived as attractive among potential employees. Furthermore, each individual perceives employer and workplace attractiveness differently. Therefore, it is not enough for companies to possess certain positive features, it is also essential for these features to be important for potential employees. Attractive employer's image must be created continually. For a company that aims to be an attractive employer it is necessary to know what the expectations of potential employees are, what is important for them when evaluating employer's attractiveness, what criteria defines employer's image (Stundyte, 2009). Several aspects that determine employer's image can be disclosed. According to Knox and Freman (2006), employer's image consists of such factors as: friendly informal culture, attractive compensation, stress-free work, an opportunity to perform interesting and

creative tasks, career opportunities, opportunities to travel abroad, non-monotonous work, standard working hours; work corresponding to education degree; friendly personnel (Stundyte, 2009). K. Harris (2006), though, provides the following definition: employer's image is the whole of how current, potential and former employees perceive an organization as a workplace (Paulauskaite, 2006). Other authors perceive employer's image similarly, however they emphasize attitudes towards an organization as an employer and employees' attitudes towards an organization as a workplace. In special page of "The Wall Street Journal" (2006) dedicated to career, employer's image is defined as emotional ratio between an employer and an employee, transferred to other stakeholders: the society in general and potential employees. D. Lefkow (2001) states that employer's image incorporates all of candidates' thoughts, emotions, perceptions and ideas associated with a company as a potential workplace (Paulauskaite, 2006; Paulauskaite, Druteikiene and Marcinskas, 2007).

Research of Employer's Image in Lithuania

In the preparation of this article, a research with the use of various document analysis and observation methods, techniques and procedures that help identify the most attractive employers and criteria for good employer's image in Lithuania was conducted. To begin with, we would like to emphasize that research of employer's image in Lithuania was first conducted in 2005 when CV.lt and "Verslo Žinios" web services had started "The most desirable employer" surveys. However, although surveys are conducted for almost a decade, no official methodology is published and only companies' rankings are accessible to the wider society. The most informative and scientifically useful employer's image research in Lithuania is, perhaps, the research conducted in 2006. This Lithuanian employer attractiveness research was conducted by JSC "TNS Gallup", the biggest international public opinion and market research Company in Lithuania. The research was divided into two stages: in the first stage the list of 20 most attractive employers was compiled; in the second stage features that determine employer's attractiveness in the society and features that the most attractive employers in Lithuania possess were identified, as well as employer's attractiveness indexes were calculated. In the first stage 851 Lithuanian residents and in the second stage 1161 Lithuanian residents were surveyed.

This research not only contributed to the identification of the most attractive employers, but also helped ascertain features that determine their attractiveness and overview the situation in Lithuania. Hence, we can state, that the results of this research have disclosed several very important aspects (Paulauskaite, 2006; Paulauskaite, Druteikiene and Marcinskas, 2007):

People in Lithuania are more likely to choose a workplace in private sector than in public sector. For Lithuanians foreign capital companies are more attractive employers than local capital companies. Lithuanian residents mostly wish to work in finance and insurance industries. Companies from manufacturing, process manufacturing, transportation, storage, communication industries, governmental and national defence institutions are perceived as attractive employers as well. The most unattractive industries are retail and wholesale; In relation to employer's attractiveness, Lithuanian residents give the highest importance to the compensation and social guarantees. Good management, appreciation as an employee, financial success of a company and good relationships with personnel are also important. In the evaluation of employer's attractiveness aspects related to general corporate image and reputation are less important for Lithuanian residents. There is no necessity for a company to be a leader in the market or to perform social activities (charity, support).

Little importance is also given to growth, development and career opportunities. Tendencies, mentioned above, are general and are common among all resident groups of various social demographic characteristics; The establishment of opportunities to perform an interesting job for current and potential employees, conditions to align work related activities with the personal life needs, and good work atmosphere, in other words, friendly personnel can help create attractive employer's image in Lithuania. In addition, important

conditions that ensure employer's attractiveness are good management and proper evaluation of employees' work. Only employers that are able to satisfy the needs of people with the consideration of all the aspects mentioned above, can expect to attract and retain the best and the most productive employees and have positive image as an attractive employer in the society (Paulauskaite, 2006; Paulauskaite, Druteikiene and Marcinskas, 2007).

Another significant attempt to evaluate employer's image in Lithuania followed in 2008, when first election of the "The most respected company in Lithuania" was organized (Jakimaviciene, 2008; Papievis, 2008; Staniulis, 2008; Stravinskaite, 2008; Serenaite and Sidaraite, 2008). It was introduced and organized by business newspaper "Verslo žinios", communication agency "VRP Hill & Knowlton" and public opinion and market research company "TNS Gallup". Although it was announced that 50 most respected Lithuanian companies would be selected, only 32 companies agreed to participate in the election (originally, it was planned that 100 organizations would participate). The number of participants, as well as a particular list of participants, was not announced publicly (Sadauskaite, 2009). Companies were evaluated in seven categories. Three of them were evaluated based on public opinion researches conducted by "TNS Gallup" and "Verslo žinios":

Public opinion survey : representative research of Lithuanian residents' opinions on the most respected companies in Lithuania; *Election of the most desirable employer* – representative public survey (researches and surveys were conducted by "TNS Gallup" together with "Verslo žinios").

Business leaders' survey: the survey of Lithuanian executives' opinion on country's most respected companies. Four remaining categories were evaluated by expert groups on the basis of the following questionnaires:

Value: the evaluation of profit, market position, income and other financial indicators of organizations;

Leadership: the evaluation of company's vision, management, strategic decisions and reputation of managers;

Management: the evaluation of management procedures, relationships with investors and customers, transparency and anticorruption initiatives, compliance with the law;

Responsibility : the evaluation of company's financial and ideological investment in employees' welfare, society and environment.

Each category was evaluated by a group of specialists that had to include up to 10 experts in above mentioned categories. Group leaders managed expert groups. Each expert group prepared questions and criteria for the evaluation of candidate companies. All the members of expert groups evaluated companies using the defined criteria for each category (Sadauskaite, 2009). Unfortunately, there was more criticism than praises after this election. Lithuanian scientists Gintare Sadauskaite and Nina Klebanskaja (2009) state, that during the preparation of the most respected Lithuanian companies' election, first, the concept of election and its key idea, must have been formed, and only afterwards methodology of the evaluation should have been developed, while in case of Lithuania this has not been done. In authors' opinion, it is not clear how organizers of the election could explain their definition of company's reputation, since in their statements, definitions of respect, reputation, in some cases even image and social responsibility are confused, while the aim of the most respected Lithuanian companies' election was to evaluate companies' reputation thoroughly (Klebanskaja and Sadauskaite, 2009).

It is worth mentioning that "TOP employer" election was organized in Lithuania as well. First "TOP employer" election was organized in 2011. This research was conducted by CV-Online and youth

organization AISEC. Therefore, first “TOP employer” research included young respondents, aged from 19 to 27 years. After two years (in 2013), “TOP employer” election was reintroduced and here, the majority of respondents were older from 26 to 35 years. In the research based on “TOP employer” methodology, selected companies were separated into 14 performance sectors: consultation/audit, wholesale/retail, insurance, energy/natural resources, finance, information technologies, food industry, manufacturing, advertising/media, construction/real estate, telecommunication, transportation/logistics, tourism, hotels/restaurants. Within these sectors, companies were evaluated using five criteria: leadership (in business), company’s image and reputation, novelty and innovativeness, career opportunities and good work conditions. From 7 to 10 companies from each sector were specified and during the survey, respondents had to choose one of them or suggest a company that is not included in the list and evaluate it (Selyte, 2014). Furthermore, from 2012 OVC Consulting together with AON Hewitt conducts “Best Employers” research in Lithuania. Studies, based on unified methodology, are conducted for several decades in more than 30 countries across the world.

This methodology, according to its authors, provides companies that seek to become best employers with a strong basis for planning and implementation of purposeful employee engagement promotion programmes. Employers are evaluated on the basis of five main factors: the stability of a human capital, employer attractiveness, culture of high-performance standards, reliable leadership and the level of employee engagement. The main determinant, in company’s ratings, is employee engagement index. Organizations independently submit requests for participation in this competition and pay fixed fee, their employees evaluate them based on criteria provided above (Dzeveckyte, 2012). To conclude, we can state that the currently available research of employer’s image in Lithuania usually involves organizations that express the wish to participate. Nonetheless, Lithuanian branches of major international organizations (i.e. 3M Lithuania, Philips, Samsung, Siemens, etc.) typically do not participate in them. However, despite the fact that these organizations contain comparatively small amount of employees, and employee turnover is not high, they have reliable and attractive employer’s image in global context and are included in the list of the most attractive employers, based on Universum’s researches (Selyte, 2014).

CONCLUSIONS

The formation of attractive employer’s image is the possibility to distinguish your company or organization from competitors in the labour market. As a company develops and attractive employer’s image in the society, it gains competitive advantage that helps attract and retain best employees and the latter assure company’s competitiveness and success in the future. The analysis of employer’s image in Lithuania reveals the fact that usually successful organizations, which are widely known in the country, participate in them. During surveys, lists of organizations and features that respondents link with particular organizations from the list are provided. Thus, people who participate in the surveys are limited in their answers. There is a lack of research to help disclose employer’s image factors that are the most important for employees in choosing an employer.

GROWTH AND VOLATILITY OF MICROPOLITAN STATISTICAL AREAS IN THE U.S.

Bienvenido S. Cortes, Pittsburg State University

Michael Davidsson, Pittsburg State University

Michael McKinnis, Pittsburg State University

ABSTRACT

A micropolitan statistical area is defined by the U.S. Department of Commerce as “A core based statistical area associated with at least one urban cluster that has a population of at least 10,000, but less than 50,000.” Recently, the U.S. Census Bureau also identified the micropolitan area as an “emerging metropolitan area.” Despite its growing importance, the literature on the economic characteristics of micropolitan areas so far has been limited. The objectives of this study are: (1) to describe the geographic distribution, growth, and volatility of the U.S. micropolitan areas during the 1969-2012 period; and (2) to identify and measure the determinants of growth and volatility of micropolitan areas. Findings show that micropolitan area growth is dependent on sectoral composition, initial market size, and spatial/location effects.

JEL: R11, R12

KEYWORDS: Micropolitan, Volatility, Central Place

INTRODUCTION

Local politicians, city managers, economic development directors, chambers of commerce, and academics have always been concerned about the economic well-being and prosperity of their local economies. Stiff competition for new firms, investment, and jobs has pitted communities against one another, with activities ranging from the provision of tax incentives to workforce skills development to natural and man-made amenities. The promotion of local economic growth and development remains controversial and problematic especially for local policy-makers. The literature on economic growth is extensive, and although the findings regarding certain determinants of growth may be consistent, these may still provide misleading and risky prescriptions to policy-makers looking for quick fixes. For example, Polzin argues that much attention has been focused on policies which have more public appeal such as education and infrastructure (rather than on sustaining basic industries) but “no proven relationship with state economic growth.” (2001: 423) The analysis of the determinants of U.S. economic growth has been applied to various geographic areas (nation, regions, states, metropolitan areas, and cities) and time periods. This paper focuses on another geographical delineation based on census population called the micropolitan statistical area. This delineation was defined in 2001 by the Office of Management and Budget as a geographical area with one or more counties and an urbanized core with a population of 10,000 to 49,999. This “micro area” is thus somewhere between a metro area and a non-metropolitan/rural area. Its significance is reflected in its desirable mix of urban-rural characteristics and amenities (Vias *et al.*, 2002). As Glavac *et al.* state: “Indeed, the availability of small-town lifestyles, combined with the availability of many modern conveniences once found only in large metropolitan centers, have recently made these micropolitan centers an increasingly important portion of the American landscape.” (1998: 633) Thus, the objectives of this paper are:

To identify the fastest-growing (and slowest-growing) micropolitan areas based on growth rates of population and per capita personal income (1969-2012);

To determine and measure the causes of economic growth and volatility of micropolitan areas.

The following section describes the economic growth (in terms of population and per capita personal income) and geographical distribution of micropolitan areas in the U.S. for the period 1969-2012. This section is followed by a review of past studies examining the determinants of growth of micropolitan areas. Although information on growth is important, what is more useful for policy-makers is to know whether changes in economic activity are stable or volatile over time. Thus, a major objective of this study is to examine the differential effects of different economic variables, particularly industrial composition, location, and suburb vs. central city, on the growth and volatility of population and income in micropolitan areas. A theoretical model is presented and then empirically tested on a sample of U.S. micropolitan areas for the period 2000-2012; tests and adjustments for problems of heteroscedasticity and multicollinearity are also applied. Finally, a discussion of the findings and policy implications are provided.

Micropolitan Statistical Areas

The number of micropolitan statistical areas as defined by the Office of Management and Budget changes over time in response to Census Bureau population figures of the counties that compose these areas. Based on the 2000 Census, there are 560 micro areas with a combined population accounting for 10.3 percent of total U.S. population. The growth of population inside the micropolitan areas during the period 1990-2000 was 9.9% (see data tables in: <http://www.census.gov/population/www/cen2000/briefs/phc-t29/index.html>) In 2010, OMB defined 536 micropolitan areas with a combined population of 27,154,213, or approximately 8.8% of U.S. (see <http://www.census.gov/population/www/cen2010/cph-t/cph-t-5.html>). For a map of these areas, check: http://www.census.gov/population/metro/files/metro_micro_Feb2013.pdf. As can be seen in Table 1, the populations and per capita incomes of these 536 micropolitan areas varied considerably over the period.

Table 1: Population and Per Capita Income Characteristics of 536 Micropolitan Areas, Various Years

Year	Population			Income		
	Low	High	Mean	Low	High	Mean
1970	2793	159666	38335	1330	7041	3269
1980	6726	175970	43195	3196	19383	8261
1990	9339	194215	44437	5458	29862	14986
2000	12088	208230	48383	9922	53720	23077
2012	13200	217390	50777	19866	116978	36152

Using a longer time period 1969-2012 and population and per capita personal income data for 536 micropolitan areas from the Bureau of Economic Analysis, average annual growth rates (calculated as logarithms of the first differences) for different time periods are presented in Table 1.

Table 2: Population and Per Capita Income Growth (In %) In The 536 Micropolitan Areas

	1970-1980	1980-1990	1990-2000	2000-2012	1969-2012
Population	1.40	0.50	0.90	0.40	0.80
Per capita income	9.08	6.18	4.36	3.82	5.70

note: authors' calculations.

As Table 2 shows, the growth rate of population in the micropolitan statistical areas averaged less than one percent annually from 1969 to 2012; the growth rates for the different decades ranged from 0.4% in the 2000s to a high of 1.4% in the 1970s. In 2012, the total population of the 536 micropolitan statistical areas was 27,216,731. Grouping the micropolitan areas into their respective Census Bureau regions, Division 3 (East North Central consisting of the states of Indiana, Illinois, Michigan, Ohio, and Wisconsin) had a combined population of 5,684,567, or 20.9% of the total micropolitan population; it also had the largest

number of micropolitan areas at 104. This division was followed by Division 5 (South Atlantic) with over four million. Division 1 (New England) had the smallest population at 1,094,646, spread over 12 micropolitan areas. At the individual state level, seven percent of the total micropolitan population resided in Ohio, which has 32 micropolitan areas. Although Texas had the largest number of micropolitan areas (43), it came in second in terms of population, accounting for approximately six percent. Connecticut and Maine had only one micropolitan area each, while Alaska, Hawaii, Maryland, and Massachusetts had two each. Based on the OMB definition, a micropolitan area consists of more than one county and has an urban core with 10,000–49,999 individuals. In 2012, the micropolitan statistical area population ranged from 13,200 in Craig, CO, to 217,390 in Claremont-Lebanon, NH-VT.

In terms of per capita income growth, Table 2 shows the variability in income growth following national business cycles. Examining per capita income (in nominal dollars) for 2012, micropolitan area income varies widely from a high of \$116,978 per capita in Williston, ND, to a low of \$19,866 in Rio Grande City, TX. This is to be expected given the regional differences in population density, cost of living, job opportunities, educated workforce, etc. At the Census Bureau division level, the average income per capita narrows somewhat from a high of \$37,346 in Division 3, which also has the highest proportion of the micropolitan population, to a low of \$34,673 in Division 7 (West South Central consisting of Arkansas, Louisiana, Oklahoma, and Texas).

The economic growth of a micropolitan area is important, but more so is the stability or volatility (i.e., the long-term track record) of that growth. As Fruth aptly states: “Simply identifying the areas that have the fastest or slowest growth rates is insufficient when trying to determine the character of a local economy. The rate, consistency, or stability of the growth is equally important.” (Fruth, 2013) Table 3 provides volatility data, measured as the standard deviation of the population growth rate and income growth rate for the entire 1969–2012 period and for separate decades. As can be seen, the volatility of micropolitan area income growth is three times larger than that of population growth. Unlike population changes which seem to be stabilizing over time, income growth is more variable, reflecting national income trends.

Table 3: Volatility of Population and Per Capita Income Growth in Micropolitan Areas

	1970-1980	1980-1990	1990-2000	2000-2012	1970-2012
Population	1.56	1.22	0.80	0.70	1.26
Per capita income	4.44	4.00	2.46	3.30	4.14

Note: Authors' calculations.

The average population growth volatility for the entire period was 1.26, with Fort Polk South, LA experiencing the highest rate at 0.065 and Manitowoc, WI with the lowest at 0.004. Similarly, the average volatility of per capita income growth was 0.034, with Hereford, TX having the highest rate at 0.15 and Lewistown, PA with the lowest variability at 0.026. Of the top 50 most volatile (in terms of population and income growth) micropolitan areas, the most volatile are found consistently in two divisions, Division 7 (West South Central) and Division 8 (Mountain). Similarly, inspection of the top 50 least volatile (most stable) micropolitan areas based on income and population shows that the majority of these stable micro areas are located also in two divisions, namely Division 2 (Middle Atlantic states of New Jersey, New York, and Pennsylvania) and Division 3 (East North Central states of Indiana, Illinois, Michigan, Ohio, and Wisconsin). Thus, there is a strong correlation between population volatility and income volatility of micropolitan areas during the period (correlation = 0.40; prob<0.0001).

Grouping the micropolitan areas with high volatility rates (“high” being values greater than the mean plus one standard deviation) and low rates (values less than the mean minus one standard deviation) resulted in only 61 (out of 536 areas, or 11%) micro areas with high income volatility rates during the period and only eleven having low rates. Similarly, only 63 out of 536 micros had “high” population volatility rates and

only two had “low” rates. Thus, it is apparent that income volatility and population volatility in U.S. micropolitan areas exhibit a good deal of homogeneity. This generally homogeneous sample provides an opportunity for understanding the determinants of local economic growth and volatility as well as the implications for regional analysis and policy.

PAST LITERATURE

The current study focuses on the growth and stability of local geographic economies called micropolitan statistical areas. Specifically, it examines the impact of industrial composition or economic base on the vitality (in terms of income and population growth) of these micropolitan areas. The extant literature on the impact of diversification on economic growth is extensive (see for example, Felix, 2012; Carlino *et al.*, 2009, 2003; Kuhlmann *et al.*, 2008; Izraeli and Murphy, 2003; Smith and Gibson, 1988; Jackson, 1984) mainly due to the policy implications of pursuing a “diversified portfolio” of industries to promote regional growth. The empirical findings, however, are mixed. Although there is no guarantee that a varied industry mix will lead to more jobs and higher incomes, local officials, politicians, and policymakers tend to favor diversification as a catch-all solution. Rather than focusing on the growth (volatility)-diversity relationship, this study attempts to identify the particular industries which have a generally significant impact on the growth and volatility of micropolitan areas. This objective provides more relevant and useful information to policy-makers rather than simply concluding that industrial diversification leads (or does not lead) to increased growth (or reduced volatility).

Another policy objective involves analyzing the relationship between job growth in the micropolitan central city vs. job growth in the surrounding suburbs. Do micropolitan city growth and suburban growth complement each other or are they conflicting? Moreover, this study covers a more recent time period, 2000-2012. This period of observation is particularly relevant as the delineation of micropolitan statistical areas was made by OMB in 2001; more important, this period also reflects national business cycles with peaks in March 2001 and December 2007. Finally, the study makes adjustments for heteroscedasticity, regional fixed effects, and spatial or distance effects.

The study of micropolitan areas has attracted both economic researchers and geographers way before the U.S. government decided to officially delineate these areas as somewhere between rural/non-metropolitan areas and metropolitan areas. Glavac *et al.* asserted that these micropolitan areas were important to analyze since these are “...areas that now provide many of the amenities of larger cities while still maintaining some of the rural lifestyle and small-town character that some people cherish.” (1998: 637) They maintained that these micro areas are different not only in terms of geographic scale but also relative to the “determinants and processes” affecting their economic growth. Glavac *et al.* estimated a simultaneous population-employment model and found that employment lead changes in population in micropolitan areas. Their results also showed that transfer payments and retail sales have positive effects on micropolitan growth while distance from a metropolitan area, property taxes, and percentage of population that are black have negative effects. Finally, amenities have no influence on micropolitan growth.

Vias *et al.* (2002) examined the same data set of 219 micropolitan areas studied earlier by Glavac and colleagues (1998). They applied the human ecology theory to explain the relationship between industrial specialization and population change in micropolitan areas. Vias and others grouped the micropolitan areas into nine functional areas based on the employment distribution across various sectors. They found that more diversified micropolitan areas grew faster while those dependent on agriculture, mining, and government sectors lagged; micropolitan areas that are classified as manufacturing, service, and trade places were stable during the period under study. In their 2006 study, Mulligan and Vias analyzed 581 micropolitan counties (not areas) identified by the US Census Bureau and Office of Management and Budget using 1990 census and found micropolitan growth from 1980 to 2000 reflected the national geographic trend where both population and employment “shifted out of the Midwest and Northeast into the Southern and Western

regions of the nation” (p. 206) They also showed that these micropolitan counties were becoming more diversified during the period due to: (1) county size (in terms of employment) with larger counties less diversified, or more specialized, than smaller counties; (2) counties with larger employment shares (or functional specializations) in agriculture, mining, and government were less diversified, while those with larger shares in trade were more diversified; (3) manufacturing was not important; (4) location was not important. Similar to Glavac *et al.* (1998), Mulligan and Vias (2006) also applied two-stage least squares method to analyze the interactions between population and employment growth. They found that changes in the populations of micropolitan counties were greater in the West and South regions; larger counties grew faster; initial population level is an important determinant; micropolitan counties with higher employment shares in agriculture and mining had slower growth than those with higher shares in trade, services or government; transfer payments limited growth. Mulligan (2009, 2010) found that the multiplier effects of construction and services were greater than that of manufacturing. Recent studies by Davidsson and Rickman (2011) and Cortes *et al.* (2013) reexamined the economic performance of micropolitan statistical areas using larger sample sizes, more recent time periods, and more explanatory variables including industrial composition, amenities, demographic variables, distance, regional dummy variables as well as fiscal policy variables. The most important determinants of micropolitan population growth were industry composition, regional/census division location of the micropolitan areas, and fiscal policy.

Aside from employing the human ecology theory and economic base theory following Vias *et al.* (2002) and Mulligan (2009, 2010) as bases for this study, another useful perspective is that of the central place theory (CPT) which identifies a rank order or hierarchy of central places (see Blair, 1991). That is, there are lower-order places such as villages or towns which produce food and other lower-order/routine household products, and there are higher-order places such as cities or regional capitals which produce specialized goods such as automobiles. The CPT’s two important concepts are threshold (or minimum market size) and range (the maximum distance consumers are willing to travel in order to buy products). As discussed earlier, micropolitan areas are becoming more diversified; thus, such “lower-order places” have the ability to be diverse given their various functional specializations and abilities. In addition, given the geographic dispersion and distribution of micropolitan areas around the country, the role of distance to a higher-order place or metropolitan area needs to be considered.

Finally, since Vias *et al.* stated micropolitan areas may be “large and significant enough to stand on their own” (2002: 400), this study will also analyze the interactions and contributions of the central city vs. suburbs in the micropolitan area context. In an early study, Voith (1998) estimated a structural model to determine the causality between city growth and suburban growth. He found that city income growth in large cities of metropolitan areas leads to higher income growth in the suburbs, higher housing prices, and minimally, population growth. On the other hand, Leichenko (2001) found that the city-suburb relationship differs over time. In the 1970s, 1980s, and 1990s, the direction of causality was from suburban growth (population and jobs) to city growth; city growth was important in positively affecting suburban growth only in the 1990s. Hollar (2011) compares and contrasts the two views on the metropolitan central city-suburb relationship: (1) the rival view which asserts that the central city and suburbs are independent competitors in the labor market; (2) the ally view which states that there is a positive, complementary relationship between the central city and the suburban area. Hollar found support for the interdependent or allies view.

MODEL AND RESULTS

The theoretical bases for this study are a combination of regional economics, economic geography, and human ecology approaches (specifically, the traditional economic base model and Central Place Theory). It derives much from earlier models of metropolitan-micropolitan economic growth developed and tested by Vias *et al.* (2002). The model estimated here uses the micropolitan statistical area (as defined by Office of Management and Budget) as the main unit of observation. There are four dependent variables: population

growth, income growth, population volatility, and income volatility. The explanatory variables of interest are industry structure (shown here by the nine different sector employment shares), central city employment change, and suburban employment change. Except for the control variables (regional dummy variables and distance), all the exogenous factors are expressed as percentage changes. The values of these exogenous variables pertain to beginning or near the beginning of the time period under study so as to account for any simultaneity issue and to address any concerns regarding the direction of causation between the variables. To adjust for spurious results, location-specific factors such as distance and census division variables are included in the specification. Thus, the general specification is:

$$\text{Growth (or volatility)} = f(\text{Initial population, Initial income, Sector employment shares, Central city employment, Suburban employment, Distance, Census divisions})$$

As mentioned earlier, volatility is measured by the standard deviation of the annual growth rates of population and per capita income of micropolitan areas. Based on the traditional economic base theory, changes in employment for nine separate industries (namely, construction; manufacturing; wholesale trade; retail trade; finance and insurance; professional, scientific, and technical services; health care and social assistance; accommodation and food services; other services except public administration) are included in the model to help identify the key sectors which contribute to micropolitan growth and stability. This study focuses on the mix of industries and does not include a diversity index given the latter's high correlation with specific sectors as also found by other researchers (see for example, Felix, 2012; Cortes *et al.* 2013). Following Leichenko (2001), central city employment and suburban employment are also added as variables of interest. Initial examination of raw correlation between job growth in the micropolitan area's central city and its surrounding suburban area indicates a negative and statistically significant relationship (corr = -2.33, prob < 0.02), contrary to the generally positive and complementary central city-suburb relationship for metropolitan areas (Rappaport, 2005; Hollar, 2011).

Following central place theory, initial population and initial income are included to reflect the "threshold" requirements for lower-order places such as micropolitan areas. Initial per capita income for 2000 is also included to check for conditional convergence of micropolitan area income growth rates and is expected to be negative following the literature. The Central Place Theory's concept of "range" is represented here by the distance variable. Following Partridge *et al.* (2008) and Partridge and Rickman (2008), distance to the nearest metropolitan area is used in this study. The relationship between distance and area economic growth, however, is ambiguous. As stated by Cortes *et al.* (2013), a negative relationship may result from loss of agglomeration economies as distance to a metro area increases ("tyranny of distance"). On the other hand, nearness to a metro area may have a conflicting or restrictive effect on a micropolitan area resulting from increased competition for revenues, labor input, and services from a larger and denser metropolitan area ("tyranny of proximity"). Finally, census division dummy variables are added to account for regional fixed effects; the base division is Census Division 1.

The general model above is estimated using the EViews software and annual data for the period 2000-2012 for a cross-section of 417 micropolitan statistical areas. The dependent variables are measured over the 2000-2012 period, while the main explanatory variables (except for initial income, initial population, distance, and regional dummy variables) are percentage changes over the period 2002-2007 to account for national business cycle effects as well as to adjust for any potential endogeneity bias. The data are taken primarily from the U.S. Bureau of Economic Analysis (for data on micropolitan area income and population), U.S. Census Bureau American FactFinder (for data on number of employees by industry), and State of the Cities Data Systems: County Business Patterns Special Data Extract (for data on central city and suburban job growth). Data on the distance to the nearest metropolitan area are taken from Davidsson and Rickman (2011). Descriptive statistics of the variables of the model are available from the authors upon request. Table 4 shows the results of applying ordinary least squares regression on the model with population and income growth as dependent variables. Each regression was initially tested for

heteroscedasticity; the presence of heteroscedasticity was then corrected using White's (1980) heteroscedasticity-consistent standard errors and covariance. In addition, tests employing Variance Inflation Factors indicated no problem of multicollinearity. The results indicate that employment growth in many industries (except for construction and other services sectors) has a positive and significant influence on the population growth of micropolitan areas. More interesting, job growth in the suburbs (and not in the central city) has a positive impact on micropolitan population. The initial levels of population and income have a direct effect on population growth indicating that beginning market size attracts people. The census divisions 5 (South Atlantic) and 8 (Mountain) grew faster than the base or omitted region, Division 1 (New England), reflecting the continued population shift from the northeast to the southern and mountain states. Finally, distance has a negative but insignificant effect on population growth of micropolitan areas.

In terms of income growth, only employment change in the construction industry has a direct and significant effect; on the other hand, the more people are employed in the health care, professional and scientific, and other services sectors, the slower the income growth. Interestingly, unlike population growth, micropolitan income tends to be more affected by job changes in the center city. This result tends to support the Central Place Theory's hierarchy of places. Moreover, the positive and statistically significant distance variable indicates that lower-order places such as micropolitan areas may be more self-supporting and dynamic given their own functional abilities and diversity. The census division dummy variables show that, relative or compared to the micropolitan areas located in the northeast region (Division 1), incomes grew much slower in Division 3 (East North Central), 5 (South Atlantic), 6 (East South Central), and 9 (Pacific) micropolitan areas during the 2000-12 period.

Table 4: OLS Regressions of Population Growth and Income Growth, 2000-12

Variable	Population Growth		Per Capita Income Growth

As mentioned earlier, this study is also concerned with the stability or volatility of a micropolitan area's economic growth over time. Table 5 shows the results of regressing micropolitan population (and income) volatility on the same set of explanatory variables. An examination of the coefficient estimates for the various employment sectors shows that job changes in the professional sector, retail trade, and construction

cause volatility in population growth. Similarly, employment changes in the suburban areas lead to increased instability. On the other hand, micropolitan areas with larger initial populations and income levels tended to have lower volatility, consistent with other studies (see Felix, 2012). Locational factors indicate that the farther the micropolitan area is to a larger urban area, the greater the population volatility; moreover, relative to Division 1 (New England) micropolitan areas, those micro areas located in Division 8 (Mountain) had more variable population growth rates while those in Division 2 (Middle Atlantic) had lower volatility.

As with population volatility, variations in construction employment contributed to higher income volatility during the period under study. However, two sectors – health care and finance & insurance – had a restraining effect on income volatility in the micropolitan areas. This finding indicates that specific sectors in the micropolitan economy, and not its overall diversity, may not only be sources of internal growth but also serve as stabilizers during national business cycles. Interestingly, the location of jobs either in the city proper or the suburbs does not have any influence on income volatility. Similar to the population volatility case, distance from a metropolitan area leads to more volatility in micropolitan area incomes. Finally, except for the west coast or Division 9 (Pacific), all of the census divisions' micropolitan areas have experienced proportionately greater instability in income growth than the base group located in the northeast region (Division 1) during the 2000-12 period.

CONCLUSION

The geographic scale, geographic distribution, and character of micropolitan statistical areas continue to attract the attention of social scientists and policymakers. This is to be expected as migration and population shifts occur and income and wealth are redistributed across the United States. This study adds to the literature of micropolitan areas by identifying specific industries or functional specializations which not only can contribute to positive economic growth but also help to stabilize business fluctuations. Consistent with Glavac *et al.* (1998), our findings show that employment changes in specific sectors lead population

growth. Moreover, initial market size (in terms of population and income) and job growth in the suburbs have a positive impact on population growth in micropolitan areas. In terms of income growth, sectors have differential effects: health, professional, and other services have a restraining effect on growth as compared to construction. An important limitation of this study is that the primary sector is not included (due to data limitations) even though agriculture has lead GDP growth in recent years. Increases in job opportunities in the center city have a direct contribution to income growth in the entire micropolitan area. Distance and regional location are also important determinants. In terms of volatility, changes in construction employment are a major source of instability for micropolitan areas. However, sectors such as health care and finance and insurance tend to have a moderating or stabilizing effect. The point is that micropolitan areas need to identify those home-grown industries that promote vitality, and encourage internal expansion via appropriate local credit or tax incentives instead of attempting to attract new firms or industries into the micropolitan area. Suggestions for further research include the application of geospatial tests and the determination of factors which may affect the decision of outside firms to locate in micropolitan areas. There is much to be learned from investigating the “psychology of place.”

TAX COMPLIANCE OF SMALL MEDIUM ENTERPRISES IN INDONESIA: A CASE OF RETAILER

Fany Inasius, Binus University

ABSTRACT

It has been argued that the regulatory requirements on business, especially those on SMEs can be a constraint on their growth. As SMEs various countries, Indonesian SMEs play a significant role in the national economy. This paper was intended to measure the tax compliance rate of particular individual retailers known as individual taxpayers on SMEs with annual income ranging from IDR 600 millions up to IDR 4.8 billion (around USD 400,000 with the exchange rate at the time when the research was undertaken) in Indonesia. Four tax compliance variables were examined namely the perception of tax rate, the referral group, the probability of being audited and the tax knowledge. From 319 respondents, who are individual retailers, the result shows that income tax rate is negatively correlated to tax compliance while probability of being audited, referral group, and tax knowledge is positively correlated by tax compliance as well. The tax knowledge, however, has a more significant impact on individual tax compliance

KEYWORDS: Tax Compliance, Smes, Individual Taxpayers, Retailers

INTRODUCTION

SMEs in Indonesia, as SMEs in many countries, also play a significant role for the national economy. They have historically been the main players in domestic activity with the number of SMEs reached 56 million units, accounted for approximately 60 percent of total GDP and holds 97 percent of the total work force in 2012 (Ministry of Indonesian SME, 2012). Previous studies have found that compliance costs fall disproportionately on small firms (Sandford et al. 1989). Therefore, in terms of the biggest contribution of Indonesia SMEs to the national Economy, the purpose of this paper is to measure the correlation of four independent variables on the tax compliance level of individual SMEs retailers in Indonesia. In addition, the four independent variables consist of the perception of tax rate, the referent group, the probability of being audited and the tax knowledge. This paper is organized as follows: First, the literature is reviewed. Second the methodology of the research is presented. The result of the testing is presented in the third part of this paper. Finally the last part concludes this paper

LITERATURE REVIEW

From one country to another the definition for SMEs varies and so do the definition of SME in Indonesia. In Indonesia, the SME Act 2008 defines a SME based on the turnover. A micro company is one that has a turnover not exceeding 300 million rupiah, a small company has a turnover not exceeding 2.5 billion rupiah and finally a medium-sized company has a turnover not exceeding 50 billion rupiah. Business turnover is one of the most accepted criteria in determining tax rules for SMEs as there are separate definitions of it for tax purposes. International experience shows that regulatory burdens appear to fall disproportionately on small medium enterprises. In recognition of their contribution to the national economy the SMEs should be supported by the government particularly in the regulatory burden and taxation (Pope, 2008). The complexity of taxation could be best measured by tax compliance cost (Pope, 1993b:70, Simon James et al., 1998:32).

The definition of tax compliance is defined by Alm (1991) and Jackson and Milliron (1986) that tax compliance is the reporting of all incomes and payment of all taxes by fulfilling the provisions of laws, regulations and court judgments. Furthermore, according to Kirchler (2007), tax compliance is the most neutral term to describe taxpayers' willingness to pay their taxes.

Previous studies on the probability of being audited, the influence of referent groups and tax knowledge has been done by Palil et al.(2011). Associated with the probability of being audited, they argued that the increase in the number of audit samples may improve tax compliance. Furthermore, with regard to the referent group they argue that personal Cultivating awareness of compliance is important. Finally, tax knowledge becomes the main factor that affects tax compliance behavior in Malaysia. The previous research about tax rate that influences taxpayers' decision to comply to tax laws has been claimed by Clotfelter (1983: 363) that tax rates is not the only policy that has the potential to discourage tax evasion but the tax rate is an important factor in determining tax compliance behavior although the exact impact is still unclear and debatable (Kirchler, 2007: 114). Furthermore, Ali et al (2001) and Torgler (2007) claimed that raising marginal tax rates will be likely to encourage taxpayers to evade tax more while lowering tax rates does not necessarily increase tax compliance (Kirchler, 2007)

In term of tax audit, previous studies claimed that audits have a positive impact on tax evasion (Jackson and Jaouen, 1989; Shanmugam, 2003; Dubin, 2004). These findings suggest that tax audits can play an important role and their central role is to increase voluntary compliance in self assessment systems. Furthermore, Witte and Woodbury (1985) also complement in their study of small proprietors that tax audits have a significant role in tax compliance. Butler (1993) also supports these findings that tax audit can change compliance behavior from negative to positive. Furthermore, Evans et al. (2005) in their studies in Australia found that the type of audit on SMEs has a significant indirect impact on tax compliance in terms of record keeping. On the other hand, previous studies by Young (1994) and Slemrod et al. (2001) found that probability of being audited was negatively correlated with compliance behavior.

Previous studies in ascertaining the importance of referent groups are also claimed by Clotfelter (1983) that referent groups play a significant role in evasion although it was not clearly discussed which was stronger: family members or friends. Furthermore, Hasseldine, Kaplan and Fuller (1994) report that themore respondents know the evaders, the more under-reporting of income may happen. In term of tax knowledge, Eriksen and Fallan (1996) argues that the level of education received by taxpayers is an important factor that contributes to the general understanding about taxation especially regarding the laws and regulations of taxation. On the other hand, the previous studies by Lewis (1982) showed that low tax knowledge correlates with negative attitude toward taxation. Furthermore, Eriksen et al (1996: 398) claimed that tax attitudes can be improved through better tax knowledge and thus this will in turn increase compliance and reduce the inclination to evade taxes.

RESEARCH METHODOLOGY

HYPOTHESES

The following hypotheses were tested in order to answer the research objective; the tax compliance in Indonesia.

The perception of tax rate is positively correlated with tax compliance
Referral group is positively correlated with tax compliance
Probability of being audited is positively correlated with tax compliance
Tax knowledge is positively correlated with tax compliance

The survey was carried out from November 2013 up to January 2014 in Jakarta to the respondents which are individual retailers located both in traditional markets as well as in shopping centers. Moreover, the location of the survey concentrated in Jakarta Province which is the center of the economy with the largest percentage of tax revenues in Indonesia. This is proved from the total domestic tax receipts around 977 trillion rupiah **where** about a third comes from Jakarta (Inasius, 2013: 152). Furthermore, the questioner in the survey consists of 20 questions. In order to improve the validity and reliability a pilot survey was conducted on a group of 30 retailers in various sectors before a total number of 1000 questioners were distributed to individual retailers throughout Jakarta who were selected at random from the traditional and modern market. The respondents were asked to indicate their degree of agreement with five statements (1= completely disagree to 5= completely agree; also, a “do not know option which was defined as a missing value for the statistical analyses). The questionnaire was prepared in both Indonesia and English versions to facilitate respondents and was divided into four variables of interest that are the perception of tax rate, influence of referent group, probability of being audit and tax knowledge. As illustrated in table 2, a total of four tax compliance variables were examined namely the perception of tax rate, the influence of referent group, the probability of being audit and the tax knowledge.

Table 1: the Descriptions of Variables

Variables	Symbol	Description
Tax compliance	TC	Minimum total score for each respondent is 20 (1 mark times 20 questions- non compliant) and maximum score is 100 (5 times 20 questions- very compliant).
Perception of Tax Rate	TR	Taxpayers' perception on tax rate. Minimum score is 4 (1 times 4 questions- non compliant) and maximum is 20 (5 times 4 questions- very compliant).
Referral group	RG	The referral group (family members and closed friends). Minimum score is 4 (non compliant) and maximum is 20 (very compliant).
Probability of being audited	PA	Probability of taxpayer being audit by the tax authority. Minimum score is 4 (non compliant) and maximum is 20 (very compliant)
Tax knowledge	TK	Minimum score is 4 (non compliant) and maximum is 20 (very compliant)

To test the hypotheses on tax compliance, the data was estimated using multiple regressions. The following equation was used to test the hypotheses and establish the tax compliance determinants.

$$TC = \alpha + \beta_1TR + \beta_2RG + \beta_3PA + \beta_4TK + \epsilon_i$$

Where

TC = Tax compliant

TR = Perception of tax rate

RG = Referral Group

PA = Probability of being audited

TK = Tax knowledge

RESULTS

Out of 1,000 surveys directly distributed to respondents who are individual retailers and have business turnover less than USD 4 million, 280 were returned with one survey is damaged. Sampling region covers markets and shopping centers across Jakarta with divisions include Central Jakarta, West Jakarta, South Jakarta and East Jakarta and South Jakarta where each area covers among 2 to 4 shopping centers. Moreover, the surveys were distributed and collected at the time of the meeting with the respondents who have chosen at random. The respondents consist of 168 (60%) females, 111 (40%) males. A minimum age of 21 years old was considered reasonable. Overall, respondents aged between 21 and 45 years old made up the largest portion with 210 respondents (75%) and a total of 218 (78%) were married. The following table

2 illustrates the Pearson correlation matrix for dependent and independent variables. The table 3 provides results of tax compliance in which all independent variables except for the perception of tax rate were found to be significantly correlated with TC ($p < 0.01$). The highest correlation occurred between TC and TK followed by RG and PA.

Table 2: Pearson Correlation Matrix for Dependent & Independent Variables

	Tax.Compliance	Group	Audited	Tax.Knowledge	Tax.Rate
Tax Compliance	1	.328**	.322**	.365**	.111
Group	.328**	1	.813**	.826**	.547**
Audited	.322**	.813**	1	.809**	.525**
Tax Knowledge	.365**	.826**	.809**	1	.469**
Tax.rate	.111	.547**	.525**	.469**	1

** Correlation is significant at the 0.01 level (2-tailed).

To test the hypothesis on tax compliance the data was estimated using a multiple regressions models. Based on this multiple regression, results in the table 3 show that tax compliance was influenced by four variables namely TK ($\beta=0.365$), RG ($\beta=0.328$), PA ($\beta=0.322$) and TR ($\beta=0.111$), though TK is the only significant predictor. The findings suggest that high tax knowledge would increase tax compliance and also become the significant factor in determining tax compliance. Therefore, hypothesis H4 (tax knowledge is positively correlated with tax compliance) is accepted. On the other hand, the perception of tax rate, the referral group and probability of being audit would discourage tax compliance.

Table 3: Multiple Regression- Dependent Variable: Tax Compliance

	-.113	-1.667	.097	1.469
	.103	.907	.365	4.111

CONCLUSION

The objective of this research is to examine the factors influencing taxpayer's behavior. Four variables of tax compliance were examined in this study, namely the perception of tax rate, the referral group, the probability of being audited and tax knowledge. Using direct question, results suggest that tax compliance was influenced by tax knowledge, the referent group, the perception of tax rate and the probability of being audited. Interestingly, however, tax knowledge becomes the strongest predictor affecting tax compliance. In contrast, the perception of tax rate, the referent group and the probability of being audited, although somewhat related are not significant enough to influence tax compliance. Furthermore, it seems that tax knowledge induces tax compliance, thus hypothesis 4 was accepted and supports the results by Eriksen and Fallan (1996). This study also indicates that the perception of tax rate, the influence of referent group and the probability of being audited are not significant to tax compliance. These results provide new evidence that taxpayers who have the perception of tax rate, high influence from family members and friends and a high probability of being audited would tend to discourage tax compliance. Therefore, hypothesis 1, 2 and 3 were rejected. With regard to the probability of being audited, the finding is consistent with the result reported by Young (1994), which showed that a high probability of being audited would potentially decrease the compliance of taxpayers. Therefore, since a high probability of being audited less encourages tax

compliance, the tax authority should not only increase the number of audit samples but also the firmness sanction in tax audits. In relation to the influence of the referent group, this result is not quite significant to improve the compliance level of taxpayers. This contradicts with the previous results shown by Clotfelter (1983), Hasseldine et.al.(1994) and Palil et.al. The opposite result may due to the character of retailers which rather indifferent to the existing taxation. With regard to the perception of tax rate, this finding indicates that the result is not significant correlated to tax compliance. In line with Kirchler (2007:114) that tax rate is an important factor in determining tax compliance behavior although the exact impact is still unclear and debatable. In summary, it could be concluded that tax knowledge has the significant correlation to the tax compliance of taxpayers as long as the fairness of tax system occur. It seems, however, that the tax compliance is solely based on tax knowledge, the probability of being audited, the perception of tax rate, and the referent group. Besides the tax knowledge in social level is the determinant factor to tax compliance.

WHEN MUST ONE GO DOWN WITH THE SHIP? HOW A NEW TARGETED LEGAL RULE CAN COMPEL PUBLIC TRANSIT EMPLOYEES TO BE HEROES AND AVERT TRAGEDY WHEN PERSONAL MORALITY AND MANAGEMENT INCENTIVES FAIL

Stephen Dnes, University of Dundee
Troy Felver, Ajou University

ABSTRACT

The recent disasters of the MV Sewol and the Costa Concordia raised questions about the need for a legal rule compelling crew members involved in mass public transportation to subvert their own desires of well-being for those of the public. Usually, operators, because of altruistic, historical and honorific personal impulses, bravely choose to assist the public even though such behaviors create acute existential threats. However, as these cases demonstrate, depending on selflessness as a management imperative can create extreme and unnecessary suffering (along with nearly unlimited corporate liability) when it is absent. The current state of criminal negligence can impute a duty to aid helpless passengers, but the exact scope of that duty is determined post hoc and where its limits lie is murky. It is quite difficult for companies to incentivize self-interested workers to suffer for the common good. Should the law create an explicit, criminally enforced fiduciary duty compelling crew to take all reasonable steps to safeguard the lives of passengers, and what should be its limits to the staff and the company? A refined and context-sensitive rule could help to balance the fundamental rights at stake, saving the maximum number of lives.

INTRODUCTION

The sinking of the *MV Sewol* on 16 April 2014 was a horrible tragedy of epic proportions. Basic outlines are well-known to the world. Over 300 people were killed when a ship capsized in relatively shallow waters near the South Korean coast ("One More Body Recovered from Sunken Ferry Sewol.", 2014). Around 8:48 AM, a sharp turn caused the ship to list dangerously ("Simulations Show Far Different Fate for the Sewol.", 2014) and distress calls were set at 8:55AM. ("Please Hurry' -- Transcript of Sinking Ferry's Desperate Calls Released.", 2014) The Korean Coast Guard responded and its ships arrived at 9:30 AM (Lee and Kim, 2014) while the ship's listing became increasingly severe. Rescue operations began shortly thereafter, but it was impossible to reach people who had not come to the ship's bridge or jumped overboard because of the ship's now-extreme tilt. By 10:23, the ship was nearly submerged and no further rescue possible (Salmon, 2014).

In this case, failure has many fathers. Many commentators blame the ship's owner for poor procedures, the government's lackluster response, and other causes. We stipulate these are all contributory factors in the disaster. However, we leave this analysis to other parties. In this paper, we will focus on the behavior of the crew. First, while some crewmembers acted with extraordinary heroism (Lijas, 2014), others drank beer while they waited for a Coast Guard rescue ("Crew of Doomed South Korea Ferry Drank Beer While Awaiting Rescue: Media.", 2014). Most damningly, crewmembers announced to passengers to stay in their seats and not attempt to reach the bridge of the ship ("Ferry Students 'floated from Cabins'", 2014) while

simultaneously violating their own commands. Indeed, the ship's captain was among the very first group of rescuees (Ryall, 2014). Their actions were a far cry from the noted case of the sinking of *HMS Birkenhead* in 1852, in which the captain and many of the troops in his charge chose to perish in order to follow the maxim "women and children first".

LEGAL ANALYSIS

Ships sink. Crews are incompetent. These are sad and unfortunate facts of life. However, the criminal code as it is interpreted, even on a sympathetic reading, does not include the most severe punishments for these actions. Afterward, the public prosecutor charged the ship's captain with murder by omission under Article 250 and 18 of Korea's Criminal Act. The captain and crew quite obviously took no affirmative action to kill; shipwrecks happen frequently. This was not a case of traditional premeditated murder; the criminal act fits much more precisely under Article 268, which deals with death by gross negligence. Why did they not charge the crew under this section? Public pressure was extreme, and death by gross negligence only provides for a 5 year prison term while murder allows for the death penalty. While the results of the selfish behavior truly shocked the conscience of the Korean nation and the world, this lack of action, *ipso facto*, should be insufficient for a murder conviction as statutorily defined.

The crew certainly lacked the requisite criminal intent to commit intentional murder. The only other way prosecutors could use the legal code to extract a murder conviction is using a crime of omission of murder. This is defined as someone having a duty to prevent the occurrence of danger and if that person does not prevent that danger, they will be punished in accordance with those dangerous results ([Korean Criminal Code], Article 18). Here, the problem is obvious: there is no defined fiduciary duty of the crew to aid passengers. The law has established fiduciary duties in many fields, for instance, between lawyers and clients (People v. Martinez, 2009), doctors and patients (Breen v Williams, 2006), trustees and beneficiaries (Keech v Sandford, 1726), and in many other positions where there is a relationship of trust and vulnerability between the principal and the agent. What does not exist is a legally recognized fiduciary relationship such as between passengers and crews in mass transit, and we believe this is wrong.

The vulnerability of passengers to crews' actions is profound. The passengers have no input on the direction and strategy of the crew in the journey to the destination. Additionally, in cases such as air travel, they are legally required to follow the directions of the crew, with civil penalties resulting from noncompliance (14 C.F.R. §§ 91.11, 121.580, 135.120). Given the law backs crewmember instructions with the force of law, it is reasonable to impose a corresponding fiduciary duty on crewmembers to put the interests of passengers above their own. Such a duty would correspond to the position of common carriers in private common law, which has long recognized special duties towards vulnerable consumers of services provided by those in the "common callings" (Markham v. Brown, 1837) such as innkeepers. A suitably defined fiduciary duty applied to transit workers would update the same principle for modern conditions.

In the Korean murder case against the ship captain, any duty that justifies murder (and in this case the death penalty) should be clearly delineated *ex ante*. Here, this was not the case. It appears the prosecution attempted to foist up a moral duty to the level of a legal one, and this smacks of an *ex post facto* law, in clear violation of the core principle of legality, where one could, in theory with all available information, determine if his actions were legal or illegal before any action is taken.

The Captain's recent acquittal of the most serious charge (Choe, 2014) bolsters the need for this duty to avoid legal indeterminacy and the possibility of prosecutorial abuse. The rights of passengers and the duties of the crew should be clearly enumerated to avoid this ambiguity. Having such a prominent case fail was embarrassing for the prosecution. The conviction for gross negligence and 36 year sentence might seem inadequate when examining the losses of the victims. However, in a future situation, the ambiguity could have been used to elicit a plea deal of greater prison time because of the threat of execution. This situation

is also not preferred, as this increases the arbitrary nature of justice. Much better for all involved would be clear lines delineating the obligations of the crew to the passengers, as this reduced vagueness would function as neither sword nor shield. We make no contention about the appropriateness of the punishment, only that societies are more likely to get behavior they desire when duties are explicit and clear. Why does this duty not exist? First, it might seem obvious and needless to demand a legal duty for the staff of an organization that transports the public. History is replete with romantic notions of the captain going down with his ship. Also, there seems to be a public perception that these events of extreme negligence are exceedingly rare. As we will show, this catastrophe is far from an isolated incident of gross negligence.

COMPARATIVE CASES

The *MV Sewol* is only one of several tragic cases in which crews may have fallen short of the level of care that might reasonably be expected of crews when tragedy strikes. On 13 January 2012, the Italian cruise ship *Costa Concordia* capsized and sank in shallow water. 32 passengers died. As with the *Sewol*, the captain was charged with a criminal offence, this time manslaughter, causing a maritime disaster and abandoning ship with passengers still on board. Yet these pre-existing legal duties seemed to do little to encourage the captain of the *Costa Concordia* to take steps to assist the passengers in his charge. At the time, it was reported that he fled the ship before it sank. Later, the captain claimed that he fell into a lifeboat as the ship listed ("Abandon ship? In recent maritime disasters, captains don't hang around", 2014). The criminal justice system might yet provide a sanction to the captain for the dereliction of his duties to his passengers. Nonetheless, we wonder if the result might have differed in the presence of a wider, simpler and better known legal rule to assist passengers under a fiduciary duty. An additional approach is seen in repeated calls for reforms to corporate manslaughter following maritime disasters. In the case of the UK, corporate criminal liability was widely discussed following the sinking of the *Herald of Free Enterprise*, a ferry operating in the English Channel which sank on 6 March 1987. 193 lives were lost. The sinking was attributed to a failure to secure the bow doors, which were in the charge of a sleep-deprived sailor. The problem was compounded by the failure of the first officer and of the captain not to check that the doors were secure (UK Department of Transport, 1987).

The act in question could be characterized as a negligent omission. In many situations, the law shows reluctance to criminalize omissions rather than acts. By contrast, a fiduciary duty can extend to taking positive steps in the interests of the beneficiary of the duty, at least in situations where a duty has been voluntarily assumed. Thus in a situation such as the *Herald of Free Enterprise*, concerning negligent omissions, a clear fiduciary duty to assist passengers might encourage crews to reflect upon whether they have made a negligent omission. This might in turn encourage crews to take effective steps toward greater passenger safety at a time when their conduct to date seems likely to have involved a sub-optimal level of care. The comparative cases also demonstrate that the probability of detection in most cases may be very low. Often, negligent omissions pass without incident. For instance, subsequent cross-channel sailings have sometimes left port with unsecured doors without the ship sinking.

Circumstances such as these present a paradigm case from an economic perspective for a wider legal duty, such as a fiduciary duty. Potential losses are very large, in fact often too large to be compensated, and the omission is unlikely to be detected. This is a noted problem justifying heightened standards of care in the criminal law (Becker, 1968). An extension of the fiduciary concept may be able to play a role in encouraging the optimal level of care. A final lesson from the *Herald of Free Enterprise* case underscores the importance of clarity in the law. The government report following the disaster noted that "the board of directors did not appreciate their responsibility for the safe management of their ships... The Directors did not have any proper comprehension of what their duties were" (UK Dept of Transport, 1987). In the jurisdiction concerned, the lesson drawn from this was to reconsider corporate criminal liability, ultimately resulting in the Corporate Manslaughter and Corporate Homicide Act 2007.

Reform to corporate criminal liability undoubtedly has a role to play in preventing similar tragedies. However, the focus on corporate criminal liability may to some extent have distracted from the duties of the individuals involved. Just as a lack of clarity in the law was a problem at the director level, the same might be said of responsibility at the individual level following the actions of crews in cases such as the *Sewol*. Having clarified corporate manslaughter, perhaps the time has come to reconsider the duties faced by the individuals involved.

PROPOSAL

We were also shocked by the crew's grossly insufficient failure to assist (indeed, they substantially impeded) any type of reasonable rescue attempts from the *MV Sewol*. However, what frightens us more is the use of a public frenzy to pervert the law into a tool of vengeance and scapegoating to appease mob hysteria. Criminalizing selfish incompetence per se leads quickly to a very steep and slippery slope. Management incentives are also probably insufficient to manage these problems; the threat of firing looks hollow compared with drowning. We believe a far better approach is a rational and prospective one that imposes clear and defined fiduciary duties on crew members to aid passengers traveling in mass public transportation. The benefits of a duty to aid passengers are clear.

First, the crew will receive notice of their duty to behave selflessly. They can either reject this duty and quit or accept it and expect additional compensation because of an additional true burden. From a law and economics perspective, the costs will eventually be borne by the beneficiaries, consumers, through higher tariffs and fees. This should be acceptable as a safety fee most consumers would want. Indeed, arguably, history has underpriced heroism and simply expected it from the crew, but with a new fiduciary duty, the benefits and costs will be properly accounted for, and maybe more importantly, provide notice of society's demands and expectations. A wider and clearer duty may have the most to offer in cases where conduct falls well short of reasonable care. Such a duty might not of course be breached by all crew and would thus be sensitive to circumstances, while retaining a clear general expectation that crew must take all reasonable steps to help. A fiduciary duty involving separate concepts of duty and breach may be particularly suitable in this context. Such a system would ideally make prosecutions similar to that of the *MV Sewol's* captain even more rare, but if they would be necessary, the legal basis for such prosecutions would be clear and just.

CONCLUSION

We leave it to others in the political process to define the scope and breadth of the rule; this will require significant study and input from affected players. Defining the frontiers of the rule will require debate and discussion in the political, legal, and business communities. We simply contend there should be some permutation of this rule added to the list of fiduciary duties recognized in law.

DETERMINANTS OF SELF SERVICE BANKING TECHNOLOGY IN KENYA

Charles Keter Kiprono Sang, Moi University
Lucy Jepchoge Rono, Moi University

ABSTRACT

Advances in technologies have allowed service providers to incorporate many different technologies into the delivery of their services to improve their competitiveness and performance. The study focused on establishing determinants that influence consumer towards the usage of self-service banking technologies. It is believed that the successful usage of self-service banking technologies will be cost and convenience beneficial for all stakeholders in the financial sector enhance improving their performance. The research model purposes an extension to the technology acceptance models and the Unified theory of acceptance and use of technology that will represents a shift from fragmented view of information technology acceptance to a unified integrated single theory that will account for use of self service banking technology. The target population for the study was users of selected commercial banks in Kenya, utilizing a sample size of 325 respondents. Reliability and validity of the data collection instrument was tested using Cronbach Alpha and Average Variance Extracted respectively. Descriptive and inferential statistical data analysis was carried out while regression analysis was used to predict the effect of selected determinants of self-service banking technology on its usage. The domains in which subjects were tested for were ease of use, facilitating condition, need for interaction, and perceived risk. The domains were significantly associated with use of self service banking technology exception of ease of use. Taking into account the importance of innovation and technological advancement studies should be carried to establish the effect of technological usage and organization commitment on firm performance.

JEL: O3, O33:

KEYWORDS: Self-service Banking Technology, Self-Service, Banking Technology, Kenya

INTRODUCTION

Technology changes our life day after day. Today, our lives have become digital and dependent on technology since we are interacting with different kind of technologies to fulfill different kind of tasks in our daily life. Some of these technologies have become important in our life more than others like computer, Internet and mobile phones. Technology embodied in small as well as in big devices where today our interaction with them increased radically since it is easy to carry and give us a high functionality. Self-service technologies are viable for banks and other financial intermediaries because information processing is essential to their services. Automation of standard services is expected to reduce the need for financial intermediaries while there will be continued demand for nonstandard, differentiated transactions and services (Emmons & Greenbaum, 1998), however this is not the case in Kenya since commercial banks are still opening up branches at a high rate for instance it grew by 102% from 2004 to 2008 (CGAP Bank Branching Regulation Survey, 2008).

This revolution in the market place has set in motion a revolution in the banking sector for the provision of a payment system that is compatible with the demands of the electronic market place (Abor, 2005). Even though with the entire technological advancement in the banking industry, some consumers have negative experiences and feelings towards such technologies. Some customers prefer personal interaction with service personnel and other customers and are less than eager or could even resist using self-service banking technology, even though consumers are increasingly being required by financial institutions to take a more

active role in the production and delivery of services through the use of self-service technologies. It is argued that the effective infusion of these technologies into the 'markets place will provide the users with many benefits such as convenience, flexibility, customization, control, enjoyment, improved service over face-to-face encounters and greater satisfaction, even though some consumers have negative experiences and feelings towards self-service banking technology. Some customers still prefer personal interaction with service personnel and other customers and are less than eager or could even resist using self-service technologies.

In Kenya the banking sector has undergone tremendous change in technology especially in Self Service Banking. Banks and other financial institutions have moved to e-banking in their efforts to cut costs while maintaining reliable customer service (Kolodinsky and Hogarth, 2001). However the adoption process has been the problem since customers are still visiting the traditional brick banking halls for most of the services which they could receive by use self-service banking Technologies (SSBTs). The successful implementation and usage of SSTBs is dependent on wide consumer adoption/usage in order for a bank to justify the investment cost. The need to understand consumer decisions regarding SSTs have attracted research attention into the factors which would facilitate consumer usage of self-service banking.

Consumers are increasingly being required by firms to take a more active role in the production and delivery of services through the use of self-service technologies (SSTs). It is argued that the effective infusion of these technologies into the 'markets place 'have provided the users with many benefits such as convenience, flexibility, customization, control, enjoyment, improved service over face-to-face encounters and greater satisfaction, even though some consumers have negative experiences and feelings towards self-service technology (SSTs). Some customers prefer personal interaction with service personnel and other customers and are less than eager or could even resist using Self Service Technologies. Self-service technologies are viable for banks and other financial intermediaries because information processing is essential to their services.

Research Questions: Why are consumers in the banking hall still queuing while they can receive the same service using self-service banking technology?

LITERATURE REVIEW

The term 'self-service technologies' was first used by Meuter, et al (2000); they defined self-service technology as 'technological interfaces that enable customers to produce a service independent of direct service of employee involvement'. The definition has gained wide acceptance in subsequent research by other authors such as (Makarem *et al.*, 2009; Dean, 2008; Forbes, 2008 and Meuter, 2005). The introduction of Self-Service Technology to the delivery of a service has led to the removal of the provider's personnel from the transaction and gave the consumers more responsibilities to the customer to transact the service on their own. Although changes in service delivery are supposedly made to benefit the customer, they often require increased the involvement on the part of the customer. These and other factors may preclude the customer from trying or using the technology. Service providers must be aware that when changes in a service are instituted, a potentially significant portion of the customer base that the change is alleged to benefit, will opt not to participate in the new service format (Langeard *et al.*, 1981). Even with all this benefits the use has remained to be so minimal amongst the account holders and bank user especially in developing countries.

For instant most of the financial institutions and banks have adopted the use of self service banking technologies such as the automated teller machines (ATM's) and internet banking (e-banking), mobile banking (m-banking) have been utilized in serving consumers and reducing costs of carrying business while maximizing profits. With the development of m-shwari a product of Safaricom and Central Bank of Africa (CBA), one can say it's an evolution of paperless banking offered through M-PESA. With M-shwari we

can call it a revolution in the banking sector. It is a paperless banking service which Enable you open and operate an M-Shwari bank account through your mobile phone, via M-PESA, without having to visit banks or fill out any forms. This is a product for everyone who feels that banking should be hassle-free. No forms to fill in, no branches to visit. Just one click on your phone and you have a saving account www.safaricom.co.ke.

The growing research into self-service banking technologies (SSBTs) has brought the need for the development of a classification system that will look at the different forms of SSTs usage by the consumers since most of the institution are putting huge investments in such technologies so as to maximize profits and minimize cost by transferring the cost to the consumers of their products. The successful implementation of SSTs is dependent on wide consumer adoption/usage in order to justify the investment cost (Lee and Allaway, 2002). The need to understand consumer decisions regarding SSTs has attracted researcher's attention into the factors which would facilitate consumer adoption/usage (Curran and Meuter, 2005). A study carried in Portugal about the use of self-service technologies in financial services revealed that customers who use the service are more satisfied compared to those who don't use the service. They also turned out to be less sensitive to prices than their counterparts who were not using the service since most of the decisions they made without persuasion. However, the customers who used the self-service technologies were more prone to complaining especially at the early stages of learning majorly due to the time invested in the learning process. Users of the technology also showed a higher tendency to purchase and were not likely change their banks compared to the non-users (Rodriguez, 2010).

A study conducted among Portuguese consumers about the use of self-service technologies in financial services revealed that customers who used the self-service banking technologies where more satisfied compared to those who don't use the self-service technologies. Consumers who used self-service technologies also turned out to be less sensitive to prices than their counterparts who were not using the service since most of the decisions they made without persuasion of personnel's. However customers who used the self-service technologies were more prone to complaining especially at the early stages of learning majorly due to the time invested in the learning process. Users of self-service technology showed a higher tendency to purchase and were not likely change their banks compared to the non-users (Maria, 2010). These reviews have produced different SSBT adoption factors and this paper suggests that there is no evidence of a widely agreed SSBT model of adoption. For the purposes of this study, five key factors, namely perceived risk, ease of use, need for interaction, facilitating condition and consumer readiness. The five factors were chosen because of their frequent inclusion in SST adoption research projects.

Theoretical Framework

The main interest of the study is on usage of self-service banking technology in Kenya and its acceptance, a fundamental managerial challenge in the implementation of self service banking technology. Thus, a review of prior studies suggested the theoretical foundations of the formulations used in our hypotheses. To this end, this study will examines two prevalent theories (i.e., TAM and UTAUT) for investigating individual information technology /information science (IT/IS) acceptance in a self-service banking context. Studies concerning consumers' intentions to use mobile services have been conducted on the basis of Davis's (1989) technology acceptance model (TAM) but Nysveen *et al.* (2005) pointed out 4 extension of TAM that may be relevant to explain intention to use self-service banking technologies in relation to mobile banking, but can this extension be used in place of self service banking technology. According to Ventkatesh and Davis 2000 they stated that TAM may be too parsimonious and it should be supplemented and extended by means of concepts such as subjective norm and image therefore UTAUT construct was included in the study conceptual framework.

Nysveen *et al.* (2005) concluded that technological acceptance model (TAM) has been used often in work-related contexts that has no implication to the end user thus the consumers' of such self-service banking

technology such those using mobile services depends on their available resources (perceived control), as predicted in the theory of planned behavior (TPB) of (Ajzen 1991). TAM has only been used in an organizational context rather than in everyday life context that users face while using such technologies (Ventkatesh and Davis 2000). That calls for the need of additional construct from the unified theory acceptance and use of technology (UTAUT) model since TAM's ability to explain various forms of technology usage is limited, and it has only been able to explain a variance of approximately 40 percent (Ventkatesh and Davis 2000). The research has combined both TAM and UTAUT dimension so as to encompass the reliability and accuracy of the technology based self-service technology usage with an aim of establishing determinants of self service banking technology usage and establishment of an effective model that will explain the usage of such self-service banking technologies.

Determinants of Self Service Banking Technology Usage

The successful implementation of Self-Service banking Technology (SSBT) is dependent on consumer usage/adoption in order to justify the investment cost (Lee and Allaway, 2002). The need to understand consumer decisions regarding Self-service Technologies have attracted research attention into the factors which would facilitate consumer adoption (Curran and Meuter, 2005). The implementation and adoption of new technology brings several questions into the minds of the consumers. In this regard it can be said that self-service banking technologies are an effective source to reduce costs and to increase the number of customers for the firm. It can also go the other way, if customers either won't try the new Self-service banking technology, or try it once and go running to the competitor. The question is 'what is customer value, and how will new Self-service banking technology (SSBT) provide the value. The research examine four key factors, namely perceived risk, perceived ease of use, need for interaction and facilitating condition. The factors were chosen because of their frequent inclusion in SSBT adoption research projects.

Hypothesis Development

Perceived Risk: Perceived risk has been examined mainly in the e-commerce in connection with the buying process of consumers (Young et al., 2005; Harper et al., 2004). Risks in Internet shopping were researched in varying shopping contexts: shopping for clothes (Cases, 2002), airplane tickets (Kim et al., 2009; Cunningham et al., 2004) and Internet shopping in general (Forsythe and Shi 2003; Liebermann and Stashevsky, 2002). Kim et al. (2009) who studied perceived risk and risk reduction in purchasing air-tickets online. They included risk dimension variables derived from the literature to date including performance risk, security risk, financial risk, physical risk, psychological risk, time risk and found that security risk was of primary importance. This finding is similar to previous research which found that payment and privacy security appeared as a major risk factors in Internet shopping settings (Forsythe and Shi, 2003). Therefore we hypothesize the first hypothesis:

H1 Perceived risk has no significant effect on use of self service banking technology.

Ease of Use: Perceived usefulness and ease of use was introduced by Davis, Bagozzi and Warshaw (1989) and conceptual the model called Technology Acceptance Model (TAM), introduced the two variables of perceived usefulness and perceived ease of use in a. Davis (1989) justified the choice of perceived ease of use and perceived usefulness as key determinants of behavior, based on a literature review of multiple disciplines dealing with behavior and innovation adoption. Perceived ease of use is introduced in the information systems literature by Davis (1989) and defined as 'the degree to which a person believes that using a particular system would be free of effort.

Extensive researches have provided evidence of the significant effect perceived ease of use has on usage intention, whether affecting perceived usefulness directly or not (Venkatesh & Morris, 2000). In order to prevent the "under-used" system problem, mobile banking systems must be both easy to learn and easy to

use. Perceived ease of use was also found to be a significant antecedent to the perceived credibility of Internet banking in a study by Wang *et al.*, 2003, the study seek to establish the effect of perceived ease of use on self-service banking technology usage in Kenya . Therefore we hypothesis:

H2 Ease of use has no significant effect on use of self service banking technology.

Need for Interaction: Lee et al, (2010) proposed that need of interaction should be included as construct in research models for Self Service Technology adoption/usage since consumers have a preference for personal contact. This construct has been researched in detailed by Simon and Usunier (2007) they found that personal contact had the strongest influence on the preference for the personal contact construct. This fact was also confirmed by Dabholkar and Bagozzi (2002) that personal traits are the basis of forming consumer attitudes and behavioral intentions on usage of such self-service technologies. Walker and Johnson (2006) reported that 35% of the respondents to their survey preferred personal contact and 65% preferred it in some occasions, including when they had a specific issue which needed prompt resolution, or when they wanted to make a complaint. Consumers develop negative attitudes towards a service provider if they are left with only Self Service Technology option and they expect to have personal backup if something goes wrong.

H3 Need for interaction has no significant effect on use of self service banking technology.

Facilitating Condition: By capturing the concepts of perceived behavioral control facilitating conditions, and compatibility such as work style, Venkatesh et al., (2003) defined facilitating conditions as the degree to which an individual believes that an organizational and technical infrastructure exists to support technology use. In UTAUT, Venkatesh *et al.* (2003) integrated 32 factors used in eight competing models into five constructs and empirically identified that behavioral intention and facilitating conditions were two direct determinants of adoption behavior. In the mobile banking adoption literature, Joshua and Koshy (2011) illustrated that the more convenient the access of respondents to computer and Internet, the more proficient their use of the computer and Internet, which results in a higher adoption rate of respondents using electronic banking. Consequently, grounded in UTAUT, the following hypothesis is put forth:

H4: Facilitating conditions has no significant effect on use of self service banking technology.

Figure 2.1: Conceptual Framework

Note: Independent variables which are the selected determinant of self-service banking usage will include: ease of use, perceived risk, and need for interaction. Self- service banking technology usage will be the depended variable. Source: Researcher (2014)

DATA AND METHODOLOGY

Research design: The study used a descriptive design since we focused on getting inferences from the findings on the impact of determinants of usage of self-service baking technology (Ease of use, Need for interaction, Facilitating condition and Perceived risk) on Usage of self service banking technology. The design for the study was a survey design which measured five variables: independent variable and dependent variable.

Target sample size: The target population will be 650 depositors out the 1000 adults in the country according to the (World Bank Report, 2013). There are 25,701,394 registered adults in Kenya, which 12,709,568 people are males and 12,991,826 people are female registered inhabitants in Kenya (UNICEF Report, 2013). A sample size of 400 responded was used accordance to Taro Yamane's formula (1967) out of which only 325 was used.

Data Collection Instruments: The questionnaires were the main instrument of data collection. Questionnaires were issued randomly to customer at the banking hall. Each respondent was given enough time to respond to questions and any clarification was done at the same time by research assistants. The questions were divided into variables of interest. Likert scale with point 7 was used to bring variation of results, with 1- very Strongly Disagree, 2- Strongly Disagree 3-Disagree, 4-Neutral, 5-Agree 6- strongly agree and 7-very strongly agree.

Data Processing and Analysis: The data collected from the respondent was coded and entered in SPSS V20 for data analysis. Before analysis was, test for normality was done so as to ascertain whether to use parametric or non-parametric test in subsequent analysis. Descriptive statistics was done to identify characteristics of demographic data of respondents while inference statistics was done for the purpose of Correlation i.e. identify the relationship between the determinants (Ease of use, Need for interaction, facilitating condition and Perceived risk) and Use of self service banking technology and Multiple Regression was done to find out the variance in the dependent variable (Use of self service banking technology) that was explained or accounted by the independent variables. The model below was used to predict the Use of self service banking technology

$$y = \beta_0 + \beta_1x_1 + \beta_2x_2 + \beta_3x_3 + \beta_4x_4 + \varepsilon \dots\dots\dots (i)$$

y =Self-service banking technology usage

β_0 =Is the constant of the equation?

x_1 =Ease of use

x_2 =Perceived risk

x_3 =Facilitating conditions

x_4 =Need for interaction

$\beta_1 - \beta_4$ = are the coefficient regression or change induced in y by each x

RESULTS AND CONCLUSION

Respond Profile: As shown in table 1, the study revealed that majority of the respondents 174 (53.5%), were males. It was also revealed that, 105 (57.5%) of the respondents were also aged below 24 years. 82 (25.2%) were below 30 years and 21 (6.5%) were above 46 years, while 123 (37.8%) of them were undergraduate degree holders from this we can assume that bank users are males and females who are aged below 24 years. The study also revealed that those with computer skills were 91.1% which indicated that majority of bank users in Kenya are computer literate.

Reliability: Reliability of the study instrument was done to determine the extent to which a variable were consistent to what was supposed to measure (Hair et al., 2006). The reliability of the items was assessed by determining the items' coefficient alpha. The generally acceptable level of Cronbach's alpha is above 0.70 and it may decrease to 0.60 in exploratory research (Hair et al. 2006). During the measurement purification, one item measuring Facilitating Condition Construct (FCa) and Use of self service banking Technology (USa) records Corrected Item-Total Correlation which was less than 0.3 and the Cronbach's alpha of the construct increased when the item were removed from further analysis. The above table reveals that the all

the factors in the construct have recorded a reliability value of 0.8 and above respectively for Cronbach's alpha.

Factor Analysis Results: Factor analysis was carried out and the results of principle component analysis highlight that the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy value is found to be above 0.80 which will indicates around 80 per cent of variance of the data is common variance. The KMO value measures the sampling adequacy and the values were more than 0.6 which is the rule of thumb in conducting analysis (Coakes et al., 2010). A summary of which is shown in table 3.

Table 3: Factor Analysis

	Items	Standardized loading	KMO	Cumulative of variance
Ease of use	Learning to use SSBT was easy for me.	0.741		
	I find SSBT difficult to use.	0.847		
	It was easier for me to be skillful using SSBT	0.824	0.843	60.624
Need for interaction	I enjoy seeing the people who work at my bank	0.631		
	Personal attention at my bank is not important	0.856		
	people at my bank do things that no machine could	0.721	0.632	55.009
Perceived risk	I feel secure conducting my banking using SSBT	0.795		
	I feel safe conducting my business using SSBT	0.828		
Facilitating condition	I know SSBT will handle my banking correctly	0.767		
	There is little danger anything wrong will happen when using SSBT	0.618	0.724	57.170
	I have the knowledge necessary to use SSBT	0.758		
Use of SSBT	All the contents of self- service banking technologies are easy to read and understand	0.771		
	The Language in document is easily understood	0.801	.659	60.363
	How likely are you to use mobile banking	0.766		
	How likely are you to use internet banking	0.727		
	How likely are you to purchase using SSBT	0.604	.628	54.077
	How likely are you to pay bills using SSBT	0.827		

Average Variance Extracted: Validity of the measurement of the instrument was done by applying Fornell and Larcker (1981), measure of Average Variance Extracted (AVE) to access the discriminate validity of the measurement. To satisfy the requirement of the discriminate validity, the square root of a construct's AVE must be greater than the correlations between the construct and other constructs in the model. For example, the square roots of the AVEs for the two constructs, ease of use and facilitating condition, are 0.74707 and 0.56751 in table 6, which are more than the correlation, 0.480; between them in table 4 this demonstrates there is adequate discriminate validity between the two constructs. The square roots of all constructs' AVEs in table 4 of this study were also greater than the correlations among all constructs in table 5. Therefore, the discriminate validity of the measurement in this study was acceptable. In sum, it demonstrated that there were adequate reliability and validity in this study.

Table 4: The loadings of the Items and AVEs of the Constructs

Construct	Items	Loading	The square root of AVE
Ease of use (EU)	EUa	.897

The low inter-correlations among the explanatory variables used in the regressions indicate no reason to suspect serious multicollinearity. To check further for multicollinearity, a diagnostic test was done using variance inflation factors (VIFs) were computed for the independent variables. As a rule of thumb, if one of the individual VIFs is greater than 10, there is an indication of multicollinearity problem (Gujarati, 1995).

The VIF values reported in the table 5 are small (much less than 10) with an average of 1.34 indicating an absence of multicollinearity between variables. The VIF can therefore be defined as; $VIF=1/(1-R^2)$ where R^2 is the squared multiple correlation coefficient between dependent variable and the explanatory variables (Maddala,2001). The minimum value of VIF is one, where R^2 is equal to zero. Hence, the closer the VIF value is to one the lower is the degree of multicollinearity. The highest correlation is between ease of use and use of self service banking technology (positive and significance), 0.363. The second highest correlation is between perceived usefulness and use of self service banking technology (Positive and significant), 518.

Table 5: Correlation Matrix and variance Inflation Factors (VIF)

	Y	A	B	C	D
Use of SSBT (Y)	1.000				
Ease of use (A)	.363	1.000			
Perceived usefulness (B)	.518**	.479**	1.000		
Need interaction (C)	.354**	.553**	.480**	1.000	
Perceived risk (D)	.472**	.479**	.559**	.425**	1.000
VIF		1.15177	1.36673	1.1432	1.2867

**Correlation is significant at the 0.01 level (2-tailed), *Correlation is significant at the 0.05 level (2-tailed). Note: VIF= Variance inflation factor

Results of Regression Analysis

The analysis of the results is presented here is in different subsections. It begins with an analysis of measures of Ease of use, Perceived risk, Need of interaction and facilitating condition. Multiple regression analysis was employed to test hypothesis in this research, According to (Hair et al., 2005), Multiple Regression Analysis is applied to analyse relationships between a single Dependent Variable and Independent Variables, and hence it was considered an appropriate method for this research. The study aimed at investigating the direct effect of the perceived risk, Ease of use, Need for interaction Facilitating condition and consumer readiness on use of self-service banking technology. Multiple linear regression models were used to investigate the effect of independent variables against dependent variable. The study results in table 6 scored adjusted R squared of 0.704, indicating that joint contribution of ease of use, need for interaction consumer readiness and facilitating condition explains 70.4% variation of Use of self service banking technology in Kenya.

Table 7 shows the prediction of the five variables on use of self service banking technology was reported to be significant as reported by analysis of variance (ANOVA) of goodness fitness with F ratio of 23.334, with p value of 0.000 less than 0.01. The Durbin Watson test the serial correlation of the data, Durbin-Watson statistic is substantially less than 2, there is evidence of positive serial correlation, although positive serial correlation does not affect the consistency of the estimated regression coefficients, it does affect our ability to conduct valid statistical tests, as such the research concluded that the significant statistics are valid.

Hypothesis Testing

To test the study hypothesis, H01, H02, H03 and H04 the study used direct effect regression model. Results on table 8 below showed that beta value for ease of use was 0.124 with p value of 0.077 which was more than $p < 0.05$ (level of significance) hence the study accepted hypothesis H01 that there is no significant effect of ease of use on use of self service banking technology. Results on table 8 below also revealed that facilitating condition beta value of 0.514 with p value of 0.000 which was significant at $p^* < 0.01$, thus the study rejects hypothesis H0₂ there is no significant effect of facilitating condition on use of self service banking technology and we conclude that there is significant effect of facilitating condition on use of self-service technology.

Table 6: Regression Model Summary

R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics		Durbin-Watson
				R Square	Change	
.853	.727	.704	.54992778	.727		1.748

* Predictors: (constant) consumer readiness, need interaction, facilitating condition, perceived risk, ease of use * Dependent Variable: use of self-service technology

Table 7: Anova

	Sum of Squares	df	Mean Square	F	Sig.
Regression	99.042	4	16.507	23.334	.000*
Residual	225.958	321	.707		
Total	325.000	325			

Note: Source: (Survey Data 2014), **Significant at $p < 0.01$, *significant at $p < 0.05$, NI need for interaction, FC= facilitating condition, EU= ease of use, PR= perceived risk. * Predictors: (constant) consumer readiness, need interaction, facilitating condition, perceived risk, ease of use, Significant * $p < .001$

Further study results on table 8 below shows that the beta value for need for interaction was 0.351 with p value of 0.000 which was $p < 0.01$ (level of significance) which was significant, thus the study rejects hypothesis H_0_3 there is no significant effect of need for interaction on use of self service banking technology and concludes that there is significant effect of need for interaction on use of self-service technology. Lastly results on table 8 showed that that perceived risk had a beta value of 0.282 with p value at a 0.000 which the $p < 0.01$ (level of significance) which was significant, thus the study rejects hypothesis H_0_4 there is no significant effect of perceived risk on use of self service banking technology in Kenya and concludes that there is significant effect of perceived risk on use of self-service technology.

ANOVA (Prob)		0.000		

CONCLUDING COMMENTS

Summary of the Findings: The study focused determinants of self service banking technology (Ease of use, Perceived risk, Need for interaction and Facilitating condition) on usage of self service banking technology in Kenya. In overall the selected determinants of self service banking technology explains 70.4% of the variation of the usage of self service banking technology in Kenya. This means that there are other factors which explained 29.6% of the variation on the use of self service banking technology. This was higher than technological acceptance model (TAM's) which it only explains a variance of approximately 40 percent (Venkatesh and Davis 2000). By combining TAM's and UTAUT Model it explained the variance by 70.4 percent which was higher than that found by (Venkatesh & Davis 2000). This implied that personal factors such as need for interaction plays an important role in use of self service banking technologies in Kenya. Need for interaction was found to be significant in a direct relationship with use of self service banking technology but when moderated need for interaction was not significant implying that end users don't need to be prepared to interact with bankers in the banking halls.

Further need of use was not significant on the use of self service banking technology in Kenya implying that most Kenyans have technical knowhow on the use of technological infrastructure hence banks should not concentrate on customizing such technologies but concentrate on other factors such as perceived risk which was very significant. This implies that consumers were worried lot when using self-service banking technologies. The implication for business especially the banking industry is that, instead of developing self-service banking technology from the organization perspective it should be from the holistic viewpoint of the consumers. Furthermore, referring to Venkataesh et al., (2003), Venkataesh and Zhang (2010), and Foon and Fah (2011), this study reveals that the effect of need for interaction and facilitating condition was significantly amplified on use of self service banking technology and only perceived risk was significant from technological acceptance model.

Conclusion: The study contributed to the theoretically by providing an overview role of contingency factors such as facilitating condition and need for interaction are crucial to technology usage. Self-service banking technology in Kenya is likely to become increasingly more important banks strive to minimize costs and maximize service in order to remain competitive in expanding marketplace. Bank managers need to continually assess consumers' propensity to accept and use the new self-service technology that they offer. The levels of optimism, insecurity, need of interaction and discomfort on facilitating condition towards using new self-service technology appear to be either a contributor or an inhibitor to the diffusion of innovative self-service technology for most consumers. Banks need to take advantage of the contributor (Optimism) and address the inhibitors (Insecurity, need for interaction and facilitating) in order to enhance the likelihood of Kenyan consumers using self-service technology to complete banking transactions.

*Recommendations :*The managerial implications are that for Banks to effective utilize the self-service banking technologies they should put much investment in awareness and provision of facilitating conditions that will enable the usage of such technologies be successful rather than investing so much on the technology itself than the end user who will consume the product . Further self-service banking technology providers have to take into consideration consumer's perceptions which deemed important on use of self service banking technology which is in line with Anitsal and Schumann, (2007) findings that SSBT's providers should consider the high level of consumer participation which sometimes the consumers are not rewarded for their input such as the provision of facilitating conditions. Therefore, an understanding of the consumer perspective is of importance in terms of awareness on the usage SSBTs.

The UTAUT model was proven to be stronger to the other competing models (Venkataesh & Zhang 2010), but only a little UTAUT-based research exist, particularly compared huge TAM/TPB-based research. This is why Venkatesh and Zhang (2010) proclaimed that studies examining and enhancing the generalizability and validity of UTAUT in various technology contexts are demanded. Based on the feedback from 325 respondents in Kenya, the empirical evidence of this study indicates that the variances of consumer intention and behavior can be significantly explained by the extended UTAUT. Table 6 presented UTAUT and TAM model combined was able to explain as much as 70.4% of the variation of the usage of self service banking technology in Kenya. As a result, the first theoretic contribution of this work is to demonstrate the validity and generalizability of UTAUT in the context of self service banking technology usage since with the addition of two construct of UTAUT model it improved the TAM model variation from 40% stated by Venkatesh and Davis (2000) to 71.04%.

Suggestions for Further Studies: Further studies should examine, other predictors of propensity to use technology should be examined. Finally, future research could examine whether the relationship between the technology readiness dimensions and "likelihood to use self-service technology" will vary across demographic characteristics of consumers. Also studies should be carried to establish the effect of self service banking technology usage on financial performance of financial intermediaries since most consumers are using such technologies are less price sensitive. Finally the samples selected might have not be representative of the whole with regard to the problem at hand of convenient sampling since Such

samples are biased because some kinds of respondents might be selected and avoid others (Lucas 2014), and respondents who volunteer for a study may differ in unknown but important ways from others (Wiederman 1999), their fore other sampling technique should be used and replicated in the same study.

Chandana Sanyal, Middlesex University Business School

ABSTRACT

The aim of this pilot project was three-fold: 1) create a learning intervention with the aim of developing priority employability skills as determined within the financial services and accountancy sector for first year undergraduate students; 2) explore the participants' experience of the programme content; 3) identify recommendations for future schemes. The United Kingdom (UK) Financial and Legal Skills Partnership (FLSP) developed a platform to provide mentoring and skills development across financial services and accountancy. Known as "Get In Get On" (GIGO), the FLSP'S virtual work experience comprises two discrete though interdependent features: 1) skills and knowledge development; 2) e-career mentoring. Between February 2014 and April 2014, twenty eight mentees and mentors (from Middlesex University and supportive organisations/individuals) participated in the scheme. The pilot evaluation suggests that there is reciprocal learning for students and professional mentors within the context of the accounting and finance profession. Students have benefited from a heightened awareness of the career opportunities available in the sector and how their studies may assist them in developing their key employability attributes. Feedback suggests that the scheme has greatest benefit for students entering Higher Education, with a view to preparing them for future employment.

KEYWORDS: Education, Career Transitions, E-Mentoring

INTRODUCTION

Graduates emerging from universities in search of employment are confronted by a number of challenges. One of these challenges is that they carry a degree stating their subject discipline rather than explicit evidence of their capability or transferable skills. Furthermore, they often lack the skills to position themselves appropriately in the employment market. Supporting education and career transition through mentoring and employability initiatives are both widely researched concepts and can address these issues. What is lacking is an examination of the contribution that mentoring can make to employability. Furthermore, advances in technology have redefined mentoring as a learning and development activity and heralded e-mentoring, using online solutions to open up possibilities of mentoring relationships that cross boundaries of time, geography and culture (Zey, 2011).

The Financial and Legal Skills Partnership (FLSP) is the 'skills champion' for the financial and legal sectors in the United Kingdom (UK). FLSP has a single goal: to proactively support the development of a skilled workforce in the UK's finance, accountancy and legal sectors. FLSP derives much of its funding from the UK Commission for Employment and Skills (UKCES). UKCES is a publicly funded, industry-led organisation that offers guidance on skills and employment issues in the UK. UKCES is an executive non-departmental public body of the UK Government's Department for Business, Innovation & Skills (BIS). In recent years FLSP has partnered with Brightside, a charity which aims to give every young person the advice or inspiration they need to get to where they want to be in life, to develop the online learning

resources and online mentoring framework known as “Get In Get On” (GIGO). The FLSP’S virtual work experience comprises two discrete though interdependent features:

Skill and knowledge development: Students undertake immersive learning courses on skills, such as customer service in financial services, commercial awareness and understanding risk, over a one month period. They undertake these courses entirely online and content has been developed and shaped by industry to centre upon the knowledge, skills, competencies and behaviours needed to prepare students for the sector.

E-career mentoring: At the core of the programme is e-career mentoring from a volunteer from the sector. This e-career mentoring gives students an opportunity to speak to a professional from the industry (or if preferred alumni contacts of postgraduate researchers), ask questions, and get advice on either the learning modules or on careers generally. As a result, the relationship between the student and mentor can be developed and could potentially lead to further work placements or even to the student applying for a summer internship or graduate entry level scheme. The platform to date has centred upon financial services and accountancy but plans are afoot to broaden occupational sectors to include legal professional services. To date the GIGO platform has been centred upon supporting sixth formers at Qualifications and Credit Framework (QCF) Level 3 to develop priority skills and competencies. However, feedback suggests that the learning content is just as relevant for undergraduate students. The project stakeholders identified a number of wide ranging drivers. However, the aims of this project were primarily to:

Support the development of employability skills in a diverse mentee group, to enhance employment opportunities and raise awareness of the attributes required to succeed in the financial services and accountancy sector.

Utilise the support of at least ten experienced mentors from the sector, and offer the opportunity to provide e-mentoring exclusively via email exchanges.

Evaluate the extent to which mentee participants are able to make better career decisions.

Establish a model of supervision for mentors, suitable in a virtual setting.

Enable FLSP to review the product portfolio with a view to establishing ‘suitability’ and ‘fit for purpose’ in the higher education sector.

Between February 2014 and April 2014, twenty eight mentees and mentors, from Middlesex University Business School and individuals from supportive organisations in the financial and legal sectors respectively, participated in the GIGO scheme. The scheme was led by the first two authors of this paper. The goal of this study is to provide researchers and practitioners with the building blocks to evaluate a project of this type and identify the extent to which the aims and objectives of the key stakeholders of the project have been achieved. These stakeholders include Middlesex University Teaching and Development Grant sponsors, the Project Team at FLSP, FLSP’s key stakeholders (in particular The Brightside Trust), MU Business School and University colleagues in the MU Business School Project Team. This paper begins with a discussion of the key concepts of employability, mentoring and e-mentoring embedded in the literature. We will provide an overview of the Get In Get On programme, outlining the aims and objectives of this project and key stakeholders. We will then discuss the methodology used in the study, provide the study’s results, and will conclude with a discussion of the relevance and importance of the findings.

LITERATURE REVIEW

This section will consider three increasingly relevant elements of career development and transitions – employability, mentoring and e-mentoring. In doing so, we make a distinction between career development as a process, set of actions or outcome and employability as a combination of skillset, mind set and internal capability.

Employability

A set of core attributes is routinely outlined by employers as indicators of their needs and as ciphers of ‘graduateness’. These relate to ‘world of work’ behavioural practices such as reliability, good timekeeping, confidence and complex problem solving and, no less importantly, to ‘soft skills’ such as communication, team working ability, the capacity to operate independently and to demonstrate contextual sensitivity, including intercultural awareness. Recognition of the value of these attributes and of their pertinence to HE learning within and outside the curriculum is fundamental to helping Middlesex University achieve the highest possible outcomes for its student population. Underpinning this is the belief that these attributes should be developed through a students’ academic journey. Both Pool and Sewell (2007) and Yorke (2006) review attempts to define the increasingly widely-used term ‘employability’, the latter seeking to distinguish what it *is* and what it is *not*. Both draw on Hillage and Pollard’s (1998) perspective around the enhanced capability to transition and shift self-sufficiently within the employment market, realising potential through sustainable employment.

Yorke (2006) stresses that what we are discussing here is employability rather than employment, the former being an on-going process of building capacity and the latter an outcome. One does not necessarily lead to the other. He also makes the serious point that employability is more likely to be effectively created *in* employment and is likely to be limited whilst a student’s primary environment is a Higher Education institution. This point brings into question the concern about employment being of a ‘graduate level’. For some graduates the move to a level of employment deemed appropriate to their age and degree discipline appears seamless however Yorke’s (2006) point above suggests that a state of *in*-employment, regardless of level, may be a richer environment for building employability than a state of *not-in* employment. Pool and Sewell (2007) review four frameworks that evolved from the late 1970’s through into the first decade of the 21st century. Hillage and Pollard (1998) identify assets to be built and then deployed, presentation skills to be developed and reiterate that personal circumstances and external forces must be considered. Bennet *et al*, (1999) suggest that course provision should combine disciplinary knowledge and skills plus workplace awareness and experience. Knight and Yorke (2004) coined the acronym USEM which goes beyond disciplinary and workplace understanding and skills (the U and the S) to include efficacy beliefs (E) and metacognition (M). Pre-dating all of these is the DOTS model of Law and Watts (1977) in which planned experiences are intended to facilitate decision making (D), increase awareness of opportunities (O), develop skills to support both the transition (T) process and development of greater self-awareness (S).

Whilst there is common ground in each, and each provides its own unique checklist, it is only in Knight and Yorke’s (2004) USEM model and Law and Watts’ (1977) DOTS models that we see the idea that the individual’s identity, the ability to make sense of their thinking and how they are or might be approaching the employment market is seen. Pool and Sewell’s (2007) review lays the foundation for their own list of essential components of employability and the clever configuration of these into both an acronym (CareerEDGE) and the visual image of a key. The strength of this model lies however in the explicit recognition that building employability requires the positioning of stepping stones in the form of increased self-efficacy, self-confidence and self-awareness. The model also makes explicit the requirement for reflection and evaluation, and the increasing importance and value of emotional intelligence (EI), both what it is and why it is a vital part of this process. The authors suggest that the means to achieving these stepping stones is Personal Development Planning, although making only fleeting reference to Moon’s (2004) paper

Reflection and Employability. It is our argument that skilful mentoring has a significant role to play in the reflection process leading to increased EI and in turn employability. It is the purpose of this research to shed light on whether e-mentoring support employability and career transitions in first year undergraduate students. The next section will review briefly perspectives on the concepts of mentoring and e-mentoring.

Mentoring and e-Mentoring

The process of mentoring, the role of a mentor and mentoring programmes in organisations are not new and most discussions make reference to the role played by the mythical character, Mentor, from whom the process takes its name. What is less commonly relayed is the description as ‘wisdom personified; a paradoxical union of both path and goal’ (Bierema and Hill, 2005, p 557). These authors conclude that the definitions and the functions of mentoring vary widely which probably contributes to the widely differing degrees of formality and structure associated with mentoring schemes. At one extreme there are the overly bureaucratic schemes dominated by administrative procedures; at the other extreme is the ‘light touch’ approach in which aims, objectives or strategic relevance are poorly developed or articulated and outcomes rarely pursued for the purpose of evaluation. What is not in doubt is that mentoring is a developmental relationship in which experience and knowledge are passed from one party, the mentor, to another party, the mentee. The usual assumption is that the former is older than the younger but as Zey (2011, p 142) points out, Jack Welch and GE recognised the need for younger employees to ‘mentor upwards’ so to speak so that older workers could keep abreast of rapidly evolving technologies.

The rapid evolution of ICT has been seized, in some cases without question, as a way of extending the process of mentoring to overcome spatial and temporal divides. Much debate has ensued, and continues, seeking to determine whether the benefits of face-to-face, traditional (or t-mentoring) are maintained, enhanced or diminished by the increasing range of modes of electronic communication now available for what is variously referred to as e-mentoring (Bierema and Merriam, 2002; Shpigelman *et al*, 2009; Hamilton and Scandura, 2003), virtual mentoring (Bierema and Hill, 2005; Zey, 2011) or instant mentoring (An and Lipscomb, 2010). Scandura and Hamilton (2003) summarise the strengths of e-mentoring, for example in overcoming the challenge global organisational structures by allowing mentors to be in different places, different time zones, to communicate either synchronously or asynchronously and even to remove some of the visual status cues which sometimes inhibit communication between the more senior or experienced mentor and the less experienced mentee. Bierema and Hill (2005) echo some of these advantages but also highlight some of the challenges such as cost and reliability of technology, the challenge of articulation via online skills, the *loss* of visual cues such as body language and facial expressions which are regarded by most commentators as being as meaningful to a relationship as the spoken words, and the challenge of creating appropriate matches when participants have no first-hand experience of each other prior to engaging. The authors also touch on the challenge of sustaining the relationship when partners are beyond each other’s physical reach, accessible or dependent purely on only by electronic means, and communication depends upon both parties readiness to open the line of communication. Haddock-Millar and Rigby’s (2014) work on the Cabinet Office-backed *Public Sector Mentoring Scheme* referred to this as ‘managing the down time’ which has been quoted as being the main reason for partnership failure in a significant number of cases.

This last point renders a brief discussion of some of the guiding frameworks utilised in this pilot worthwhile. Factors influencing the degree of success of a mentor-mentee relationship include the style, or range of styles, adopted by the mentor, an understanding of the stages that a relationship may, and possibly needs to evolve through, and an understanding of the key ingredients of success required for each mentor-mentee exchange. Klasen and Clutterbuck (2002) describe mentor styles in terms such a coach (sic), facilitator, counsellor and guardian depending upon the degree and balance between influence (directive or non-directive) and emotional or intellectual challenge. The stages that a relationship evolves through are described as rapport, direction, progress, maturation and close with the key variable related to each stage

being ‘intensity of learning’. Finally, to ensure that each exchange delivers optimum value each party needs to ensure a high clarity of purpose built on a foundation of high rapport. Given the context of this paper, to achieve this combination requires the cultivation and practice of highly valuable employability attributes.

METHODOLOGY

The primary research strategy was action research involving iterations of action and reflection, theory and practice shaped by perspectives of all participants at regular intervals (McNiff and Whitehead, 2009). The purpose of the ongoing and summative programme evaluation is to understand the benefits for stakeholders, consider appropriate project adjustments or fundamental changes or even whether the programme should continue. Being open to the unexpected outcomes and post-development outcomes is equally as important, as these can easily be missed if the evaluating team adopts a blinkered approach. The Project Team utilised a mixed-method approach to address the following research objectives: Identify specific outcomes within individual mentoring partnerships; Identify lessons for building relationships between HEIs and employers around recruitment, learning and development; Evaluate the contribution of mentoring to the broader employability agenda; Identify the factors associated with a positive or negative experience of the Scheme;

Adopting a Mixed-Method Approach

The Project Team utilised a mixed-method approach including the facilitation of semi-structured interviews, focus groups and questionnaires, to provide qualitative, quantitative and visual data. Mentees were surveyed at the start of the programme using the online *Survey Monkey* tool in order to capture the participants’ profile to enable a comparison between the mentors and mentees, to evaluate participants experience and value of the recruitment process, project launch, and training/briefing and to capture participants’ expectations and rationale for joining the scheme. At the conclusion of the eight-week programme another online survey of mentees was undertaken to evaluate the mentees experience the virtual work experience and e-mentoring relationship. This survey also provided an opportunity to capture qualitative responses for later thematic analysis. A third data set was generated at the conclusion of the programme via a combination of online survey and one-to-one interviews to evaluate the mentors experience the e-mentoring relationship. In addition to this survey and interview data, an additional data set was available from FLSP which enabled the Project Team to determine the level of activity and engagement with the online materials. The strategy has provision to re-visit participants in May/June 2015 to evaluate advancement and seek to identify how the programme has contributed to this.

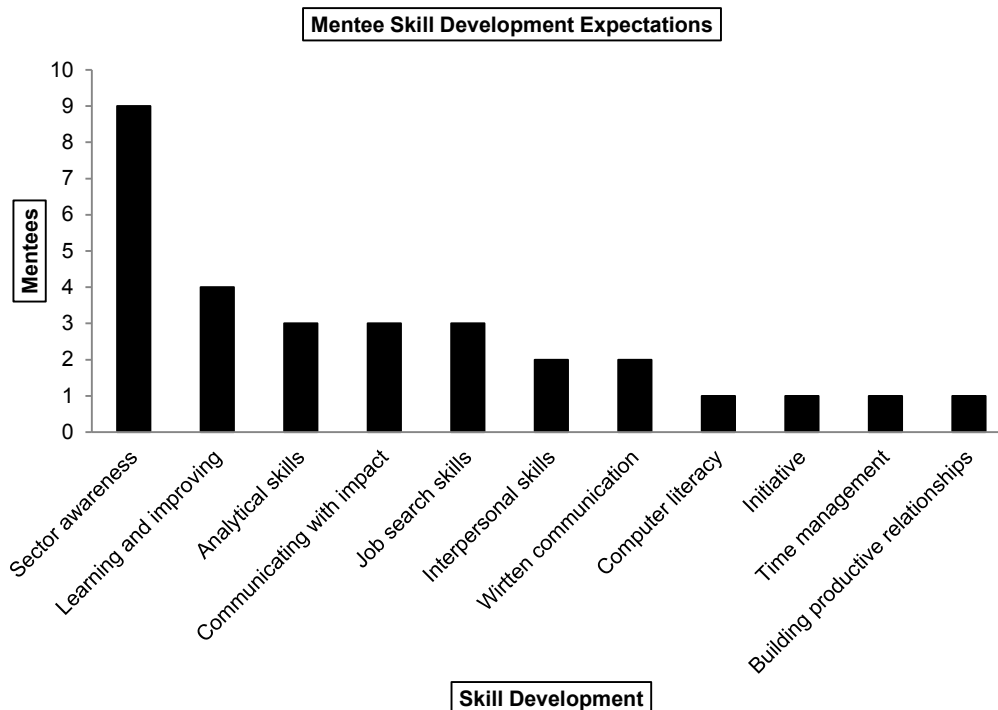

RESULTS AND DISCUSSION

Fourteen mentees commenced the programme on 1st March 2014, each supported by a mentor from the accounting and finance sector. The mentees were drawn from a range of Middlesex University Business School undergraduate programmes including Accounting and Finance, Business Accounting and Economics with an equal split of male and female mentees. Of those mentees that completed the baseline survey ($n=10$) 44.44% were aged 16-18, 44.44% were aged 19-24, 11.11% were aged 25-34. The majority of mentees were of Asian origin (55.55%), 22.22% were Black African, 11.11% White British and 11.11% White other. The Universities and College Admissions Service (UCAS) point entry ranged between 180 and 300. The mentors came from a range of public sector, private sector and small and medium-sized enterprises (SMEs), including Standard Life, Bank of Scotland, Simply Health and the FLSP. Eight mentors were female and six were male.

Mentees were asked why they wanted to join the programme. Responses can be grouped into two categories. The first category was a desire to gain experience of virtual mentoring: *‘I have never had the experience of being a mentee especially through a virtual way so this really caught my attention; for the experience of being virtually mentored by someone in the field.’* The second mentee driver was the desire to develop

employability skills and sector knowledge: *'I think it's great to have on my CV and I will learn more about interviews and enhance my accounting skills; I wanted to increase my knowledge and receive valuable help from a mentor who will guide me to the right way of entering my career and to build a strong CV; It also allows me to ask questions regarding interview techniques with my mentor.'* During the course of the mentor interviews, several reflected on the importance of mentoring, both for themselves and the mentees. Again the responses can be grouped into two categories. Some mentors wanted to gain experience of virtual mentoring: *'It was a development opportunity to learn about a new method of mentoring; my organization was offering the experience and I had never experienced e-mentoring previously.'* The other theme emerging was a desire to help others access the profession: *University students don't always get the opportunity to have a business mentor straightaway; it is really good to actually help other younger people progress in their careers to get help as early.'* Finally, the baseline survey of mentees at the outset asked them to select three skills they most wanted to develop through the scheme - the results can be seen in Figure 1 below.

Figure 1: Mentee Skill Development Drivers

Mentee/Mentor programme engagement The level of engagement with the programme was determined via data generated from the GIGO platform. Data was available under the following seven headings for each mentee-mentor pairings: Units completed by mentee Mentee time spent on site Mentor time spent on site Mentee messages sent to mentor Mentor messages sent to mentee Mentee number of logins Mentor number of logins Engagement varied across the groupings. The two extremes are illustrated in Figure 2 below.

Overall, seven mentees complete all eight online courses, six mentees complete between one and six courses, one mentee failed to complete any course. The mentee survey indicated that participants were very satisfied with the relationship engagement with their mentor. The majority (60%) of mentees felt that they had good rapport with their mentor and 40% felt that they had high rapport. All mentees felt that they achieved high clarity of purpose with their mentor. Mentees perceptions of the online GIGO course content

and its contribution to their employability were also sought. The mentees were asked to rank the sector and employability scheme content from 1 – 4 in terms of value, 1 being the highest. Overall, the sector course driven content proved more valuable (60%) than the employability course driven content (40%). All survey participants felt better prepared to enter the world of employment, 20% attributing this entirely to the FLSP programme and 80% attributing this to a large extent.

Figure 2: Mentee and Mentor Programme Engagement

Pairing Number	Units Complete	Mentee Time Spent on Site	Mentor Time Spent on Site	Mentee Messages Sent to Mentor	Mentor Messages Sent to Mentee	Mentee Number Logins	Mentor Number Logins
1	8	17 hrs 48 mins	9 hrs 37 mins	79	56	37	27
14	0	57 mins	2 hrs 24 mins	4	10	5	15

When mentees were asked to rank the four sector-specific modules, two rated more highly than others, namely understanding the client and understanding the sector. Qualitative responses included: *'In every sector understanding of client knowledge it is very beneficial for a sector as well as if you have more knowledge about sector and the client your dealing with then you will understand your roles and responsibilities within the sector and also understating the risk of work your dealing within sector and the you are performing'. 'Understanding the client and the sector were the most valuable courses I undertook, because of awareness of the financial sector as a whole. It let me become clear about the whole sector and procedures being undertaken inside the business and how to improve the business and what do the clients' needs are.'* *'The reason why I rated the four sectors in that order, is that it's important for any individual to first understand the sector they are going into, then the roles and responsibilities they have to undertake. It's then very important to understand clients and what they expect from you and what their needs are.'* *'As someone in my shoes with a very limited understanding of the sector and what it entails, certainly, the course where I learned more of the sector was the most valuable. Knowing the sector is, to me, the fundamental building block to pursuing a career in the financial sector. Learning the roles and responsibilities in the sector was the second most valuable course because it gave me an insight into the different roles I could pursue in the sector and what they entail to being successful. A lot of these roles have client interaction at the fore therefore understanding the client was the third most valuable course. The least most valuable course for me at this point was understanding risk. While it was an interesting course, I think it will prove to be useful once I enter some of the management and higher stature roles in the sector rather than where I am now.'*

For those students that have limited experience or no experience of the sector an introduction to the world of accounting and finance through virtual means can begin to develop the on-going process of capacity building (Yorke, 2006). Indeed, Knight and Yorke's (2004) model is particularly relevant here; mentees are developing workplace understanding and skills from both a client and sector perspective. When mentees were asked to rank the four employability-specific modules, 'communicating in a professional environment' rated more highly than others. Qualitative responses included: *'Communication is a core skill in any business and this is the skill employers first of all look at.'* *'The reason why I rated this in this following order is, individuals should know how to behave in a professional manner in the sector, then it's important to make a great impression where you work so that staff there communicate with you freely and this leads to getting in and on with other staff there which I rated 3rd. Finally it's skills to success as you learn this on the go while doing your job and going ahead.'* *'Getting In and Getting On proved to be the most valuable course for me. This is because of, prior to the course, I had a very low understanding of the different ways of entering the industry. Without the knowledge of how to specifically get into the industry, all the other courses seem moot. The second valuable course for me was making a good impression. Now*

that I had some idea of the different paths of getting into the industry, I could focus on "Making a Good Impression" on employers and interviewers so that I could give myself the best chance of getting into the sector. This ties in also with the course "Communicating in a professional environment". The simple fact that mentees are given the opportunity to reflect on their professional development throughout the programme through a variety of methods, can provide the catalyst to increase self-confidence and self-awareness (Moon, 2004). Overwhelmingly, mentees felt that their communication skills had improved and their understanding of how to conduct themselves in a professional manner in the workplace. Pool and Sewell's (2007) essential components of employability are entirely relevant here, from the importance of reflection and evaluation, intrinsically linked to EI.

Interviews with mentors suggested repeatedly that the programme was and is 'fit for purpose' and appropriate for the first year undergraduate group; for example: *"It is fit-for-purpose because if you look at the units that the young people work through it is an introduction to the sector and some of it gets quite involved ... researching a career as an actuary, a financial advisor, an accountant, different types of accountancy."* (Mentor Interviewee, FLSP) *"Overall view of the programme: really enjoyed taking part; great for me and him; it was time pressured however, perhaps a longer window would deepen the value (for both of us)."* (Mentor Interview, Simply Health) *"Some of the questions and tasks assumed a certain level of prior knowledge, especially regarding 'behind the scenes' type roles e.g. back office activity, Actuarial roles – would be useful to provide an overview or some insights into this type of work. The content was appealing to first years (University students) than I think it would be later on ... it's a good introduction. I think if you were in your final year at University with exams going on, I don't think you would be as committed to it, I think it is quite useful for first years or second years quite early on."* (Mentor Interviewee, FLSP) Here we can see that the timing of the programme is important.

At what point of an undergraduate students' journey should the programme be introduced? It is clear that both mentees and mentors felt that the beginning of a degree programme provides the best opportunity to engage with the scheme, developing knowledge and skills which can inform and support further study. The pairs that completed the programme reported a high degree of purpose and focus, supported by strong rapport. In all these mentoring pairs, participants felt that the mentoring relationship had reached the maturity stage having established and maintained rapport, setting direction, progressing and maturing (Clutterbuck and Klasen, 2002). In the majority of these pairs, the mentee was based in London and the mentor was based in Scotland. What this demonstrates is that the challenge of geographical distance can be overcome by e-mentoring (Scandura and Hamilton, 2003). Furthermore, whilst the relationships were conducted entirely by email and the website platform which facilitated online discussion, the loss of visual cues and body language do not appear to have presented a barrier for the participants that completed the programme (Bierema and Hill, 2005). When asked about the style of mentoring, mentees and mentors felt that the style adopted was predominantly that of a coach or facilitator (Klasen and Clutterbuck, 2002). The characteristics of these styles included collaboration, challenge and critical friendship. In the majority of pairs the mentees felt very comfortable with the mentors' form of questioning, choice of language and engaging approach to the course content. The mentees felt sufficiently stretched and challenged, whilst at the same time acknowledging the supportive style of the mentors.

CONCLUSION

A primary objective of the GIGO programme was to support the development of employability skills in a diverse mentee group, to enhance employment opportunities and raise awareness of the attributes required to succeed in the financial services and accountancy sector. The survey and interview data demonstrated a unanimous positive response from mentees. The mentees are now more aware of the range of opportunities available in the sector and the skills needed to succeed. Communicating in a professional environment was the most significant developmental area for mentees. A second objective was also unanimously achieved according to mentee respondents who now believe they are better informed of the range of career

opportunities available to them and therefore able to make clearer career choices. Another objective was to determine whether the GIGO content and format would be applicable to a slightly older audience than it was initially designed for. The data from both mentees and mentors suggests that the model is an 'ideal' fit for first year undergraduate students. The general consensus is that undergraduate students need to think about their employability from the time of entering Higher Education; waiting until the second or third year can put students at a distinct disadvantage to those that have established networks. Prior to this programme the GIGO platform had been designed to support sixth formers at QCF Level 3 to develop priority skills and competencies. However, feedback suggested that the learning content is just as relevant for undergraduates. There is also evidence that the programme offers the opportunity for both mentee and mentor to develop their respective professional practice. For mentees, the greatest opportunity is to learn from someone experienced in the sector, developing their knowledge of the sector, raising awareness of roles and opportunities available to continually develop their work-related skills. For mentors, the greatest opportunity is to develop their mentoring capability and adaptability in a variety of dimensions including guiding, coaching and facilitating learning.

The results are relevant to both researchers and academics engaged in developing the curriculum and supporting students' employability and successful career transitions. Whilst there is confirmation of great strengths in the GIGO there are other areas where the programme might be strengthened further. Examples include consideration of how to strengthen rapport in a purely email mentoring relationship and how to establish the appropriate duration for the programme for ensuring that benefits are optimised and realised without this voluntary engagement impinging upon other commitments and priorities. There is also an issue to be aware of regarding the briefing of mentors and mentees prior to matching. In this programme mentors were trained and briefed by Brightside; mentees were trained and briefed by Middlesex University staff. Whilst there is little evidence from this research that this caused an issue, in order to reduce the risk of misunderstanding arising it may be worth considering closer liaison and alignment of messages and theoretical underpinnings prior to training of both mentors and mentees. Overall, the majority stakeholder aims and objectives were met. The majority of participants felt that they had enhanced their employability skills and through their mentoring relationships developed a greater awareness of the attributes required to succeed in the financial service and accountancy sector. The majority of mentees felt better able to make career choices going into their second year of studies. The pilot scheme has given the FLSP confidence that the 'model' including the platform and programme content are suitable for first year undergraduate students.

Dr Julie Haddock-Millar is a Senior Lecturer (Practice) and Senior Teaching Fellow in Human Resource Management and Development at Middlesex University Business School. Prior to joining Middlesex University, Julie worked in a variety of business, project and human resource roles in the private sector, ultimately responsible for the talent management and development of 10,000 employees, across 36 stores with Tesco Plc. Julie completed her Doctorate in Professional Studies with Middlesex University in 2013. Her research focuses on employability and professional development, with a particular focus on early career entrants. Her professional practice involves working with organisations to develop a range of learning and

development interventions, including the creation, implementation of mentoring programmes for employability and professional development. Between 2010 and 2013, Julie jointly led the Public Sector Mentoring Scheme in which a strategic response to the UK Cabinet Office need to encourage greater diversity at senior levels of the UK Civil Service was designed and delivered. Julie leads on a number of postgraduate programmes, including the MA in Further Education Sector Management Practice, helping to prepare College Principals for the next phase of their careers. She is a Senior Fellow of the Higher Education Academy, Academic Assessor and Chartered Member of the Chartered Institute of Personnel and Development, and was a finalist of the 2010 CIPD People Management Awards for her postgraduate research studies.

Chris Rigby BA(Hons), PGCE, MBA, Assoc CIPD Senior Lecturer (Practice), Human Resource Management and Development Department of Leadership, Work and Organisations Room W121, Middlesex University Business School, The Burroughs London NW4 4BT

Chris Rigby is a Senior Lecturer (Practice) in Human Resource Management and Development at Middlesex University Business School. He has over 10 years of experience of working with organisations to ensure that strategy, systems and stakeholder interests are aligned. The earlier part of Chris' career was in secondary education and his transition to Higher Education has its roots in the completion of his MBA at Henley Management College in 2006 where he researched leadership development programmes to highlight the link between reflective practice and leadership development. His specialist areas include individual, team and organisational learning, professional practice, coaching, mentoring and action learning. Between 2010 and 2013, Chris jointly led the Public Sector Mentoring Scheme in which a strategic response to the UK Cabinet Office need to encourage greater diversity at senior levels of the UK Civil Service was designed and delivered. He currently leads postgraduate leadership development programmes within the public and private sector designed to recognise the transfer of learning into the workplace. He is an Associate Member of the Chartered Institute of Personnel and Development, a member of The European Mentoring and Coaching Council (EMCC) and holds the Professional Certificate in Coaching from Henley.

Chandana Sanyal BA (Hons), PGCertHE, MA HRD, FHEA, Chartered FCIPD Senior Lecturer (Practice), Human Resource Management and Development Department of Leadership, Work and Organisations Room W121, Middlesex University Business School, The Burroughs London NW4 4BT

Chandana Sanyal is a Senior Lecturer (Practice) in Human Resource Management and Development at Middlesex University Business School. She has over 12 years of experience of working as a human resource development practitioner and a further 5 years' experience of working in a senior management role in the public sector. Chandana made a transition from practice to academia after completing an MA in HRM at Middlesex University in 2009. Her specialist areas include individual, team and organisational learning, professional practice, coaching, mentoring and action learning. In 2011, Chandana led an International Professional Mentoring Programme within the Business School and has developed research on mentoring in Higher Education. She is currently delivering bespoke postgraduate leadership development programmes within the public sector. Her doctoral research focuses on her own professional practice in this area. She is a Fellow of the Higher Education Academy and Chartered Institute of Personnel and Development.

BUSINESS STRATEGY AND THE ENVIRONMENT: TESCO PLC'S DECLINING FINANCIAL PERFORMANCE AND UNDERLYING ISSUES

Julie Haddock-Millar, Middlesex University Business School
Chris Rigby, Middlesex University Business School

ABSTRACT

CASE DESCRIPTION

The case presents a teaching tool which requires students to: 1) analyse the financial performance of Tesco Plc over the last four years; 2) compare Tesco's market position with key competitors; 3) identify and evaluate Tesco's business strategy; 4) evaluate the causes of Tesco's decline in performance; 5) develop recommendations to address declining performance; 6) identify and evaluate the Human Resource strategic role in addressing and supporting performance. The case is suitable for a business strategy or human resource strategy class. The case is appropriate for use at the undergraduate or masters level. Students should have some familiarity with business and human resource management strategy before being assigned to the case. Students might be assigned to work individually or in teams on the project. Individuals or groups may be required to present their research to the class for discussion and comment. Six to ten hours outside of class should be required to complete the case study exercise. Classroom discussion should be between two to three hours.

JEL: L81, L21

KEYWORDS: Retail Trade, Financial Performance, Business Strategy, Human Resource Management Strategy

CASE INFORMATION

The Grocery Retail Sector

The United Kingdom (UK) supermarket industry is dominated by the 'big four' supermarkets including Tesco, ASDA, Sainsbury's and Morrisons. Together, they accounted for over 75% of retail grocery sales in the UK in 2013 (Grocery News, 2014). The high-end supermarkets, Waitrose and Marks and Spencer and discounters, Aldi and Lidl are making significant shifts in market share, facilitated by their clear brand image, focus on the target customer and transparent business strategy.

Tesco Plc

Tesco began trading in 1919 when Jack Cohen started selling surplus groceries from a stall in the East End of London. The Tesco brand first launched in 1924 when Cohen bought a shipment of tea from a Mr T. E Stockwell. The initials and letters were combined to form Tes-co and in 1929 Mr Cohen opened the first Tesco store in Burnt Oak, North London. Tesco became a private limited company in 1932. In 1947 Tesco Stores (Holdings) Ltd floated on the stock exchange with a share price of 25p. In 1968 Tesco opened its first 'superstore' in Crawley, West Sussex. In 1974 Tesco opened its first petrol stations, and would become the UK's largest independent petrol retailer. By 1979 total sales exceeded £1bn, and within three years sales had doubled to more than £2bn. In 1987 Tesco successfully completed a hostile takeover of supermarket rival Hillards for £220m. In 1992, the company launched its slogan 'every little helps', followed by the Tesco

Value range in 1993. The Tesco Clubcard scheme launched in 1995 and in 1995 Tesco became the UK's biggest retailer. Tesco overtook rival Sainsbury's as the UK's largest food retailer. In 1996 Tesco introduced 24-hour retail trading in stores. Tesco expanded overseas in Poland, the Czech Republic, and Slovakia. In 1997 Tesco appointed Sir Terry Leahy as Chief Executive Officer. Leahy began his career with Tesco as a marketing executive in 1979. Leahy was previously appointed to the board in 1992. Tesco.com was launched in 2000 and the supermarket continued to expand its range of products, which now includes clothes, electricals and personal finance products. In 2004 Tesco entered the broadband market. In 2006, Tesco announced plans to open stores in the US under the name 'Fresh and Easy' and funded by existing resources. By 2006 Tesco operated in 12 countries (see Table 1).

Table 1: Tesco market presence

Market	Number of stores/customers per week	Date of entry and trading formats
UK	3,378 stores/ 38 million customers	1929 – full range of formats
Customer Insight Sector - Dunnhumby	350 million people in 28 countries	1989
Hungary	200+	1995 – full range of formats
India	Franchise agreement	2008 signed a franchise agreement with Trent Ltd, part of the Tata group, to supply Star Bazaar with exclusive access to Tesco retail expertise. Provide 80% of the stock sold by Star Bazaar, both food and non-food, sourced through the distribution centre in Mumbai.
Ireland	146	1997 – full range of formats
Malaysia	49+	2002 - hypermarkets
Poland	450+ stores / 5 million customers	1996 – full range for formats
Slovakia	150+	1996 – full range of formats
Thailand	1,700+ stores / 12 million customers	1998 – full range of formats
Turkey	190 / 1.3 million customers	2003 – full range of formats
Financial Sector - Tesco Bank	7 million customers access products	1997 - Offer a range of personal banking products, principally - mortgages, credit cards, personal loans, savings.
Czech Republic	300+	1996 – full range of formats

Source: Adapted from <http://www.tescopl.com/index.asp?pageid=276>

Tesco now has five store formats: Extra stores which are large out of town hypermarket stores, Superstores and Tesco Convenience stores, split into Metro stores and Express stores (See Table 2). In addition to this, Tesco owns 12 Homeplus stores (non-food), 722 'One Stop' convenience stores and 34 Dobbies Garden Centres. Tesco now operates a variety of trading formats, designed for different shopping patterns.

Table 2: Store format and shopping patterns

Store format	Number of stores in the UK	Shopping patterns
Hypermarket	247	Customers wishing to shop a range of categories, food and non-food, alongside additional services such as coffee shops and restaurants.
Superstore	482	Customers' main, weekly, food and grocery shopping. Family's needs can be met in one convenient time-saving trip.
Metro	195	Offers the choice and value of the superstore for workers and residents in town centres.
Express	1672	The Express petrol forecourt and convenience store format serves customers wishing to purchase little and often.
Homeplus	12	Customers wishing to shop a non-food range.

Source: Adapted from <http://www.tescopl.com/index.asp?pageid=71>

In 2007 Tesco launched 'Fresh and Easy' in the US, California, Nevada and Arizona, at the same time the country was about to enter recession and the subprime mortgage crisis, massively impacting consumer shopping habits, shifting sharply towards price sensitivity (Hsu, 2012). The small-format stores, modelled on the UK format, with self-service checkouts. Tesco intended to open 1,000 stores with projected breakeven by 2009. However, by 2009 only 199 stores had opened in northern California (Goodwin, 2009).

By 2012 Tesco had pulled out of the US market, writing off £1.2 billion. Customers complained about small portion sizes and short expiry dates. The traditional conservative customers failed to warm to the idea of self-service checkouts. US customers were also confused about brand positioning. Fresh & Easy stores were smaller than many of the US supermarkets. The customer expectation was that Tesco would focus on the basics: essential food and grocery items and low price points. Instead Fresh & Easy opened in upper working-class areas, products and marketing seemed to be aimed at more affluent shoppers.

In 2008 Tesco bought a number of Somerfield stores on remote islands in Scotland, giving Tesco a presence in every single postcode area in the country, with the exception of Harrogate in North Yorkshire. In 2009 Tesco Bank was launched as a joint venture with Royal Bank of Scotland to create Tesco Finance.

In this period of time, Tesco grew the hypermarket format and continued to invest heavily in land procurement, amassing a huge land bank. According to the Guardian, Tesco has land and buildings stored in the land bank, large enough to build 15,000 homes. Tesco store 310 separate sites in England, Scotland and Wales vacant of Tesco stores, the majority of which is undeveloped. The Competition Commission inquiry found no evidence that the land holdings of the major supermarkets impacted on competition.

In 2010, Tesco has announced that its CEO, Sir Terry Leahy, was due to step down in March 2011 after 14 years, leading the UK's biggest supermarket Group. During his leadership period, he oversaw the acquisition and launch of supermarket chains in Poland, Turkey, Thailand, Japan and the US, moved Tesco into mobile phones, banking, and developed marketing intelligence database that is its Clubcard loyalty scheme. Leahy's focus was three-fold: 1) the customer; 2) reaching the number one spot in UK grocery retailing; 3) identifying and developing new long-term growth in non-food, service and international expansion (Sefton, 2010).

Leahy was replaced by Philip Clarke, previously ran Tesco's European and Asian operations and IT. Clarke worked for Tesco for his whole career, following graduation at University. Soon after, Clarke announced £1bn of new investment in stores to develop a new concept within the hypermarket format.

Since Clarke's appointment, the grocery retail sector has seen a marked change in consumer shopping habits, caused by the economic downturn and modern lifestyle. Over the last two years, shoppers have switched from the large weekly shop to a convenience model, choosing to stop off at their local stores on the way home from work rather than visit a supermarket. There are a number of specific reasons for the change in shopping patterns: the qualities of the supermarket have now been brought to the local store; consumers are more conscious about food waste as the economy and pockets are squeezed and are therefore opting to do mini-shops; consumer are less responsive to large-scale food promotions on 'unhealthy products' and fresh products on 'buy one get one free' offers which cause waste; consumers use convenience stores for 'top-up' shops to supplement online orders. Data from the Association of Convenience Stores (ACS) shows that 59% of all shoppers visit convenience stores more than once a week.

The majority of the major food retailers have plans to increase the number of their convenience stores, including Waitrose and Aldi. According to the Institute of Grocery Distribution (IGD), the convenience stores market is worth £35.6bn, about a fifth of the total food and grocery market. By April 2018, this is estimated to have risen 30%. The company with the most convenience stores in Britain is Premier, which is owned by the wholesaler Booker and has 2,800 sites, while Bestway has 2,600, Spar 2,400, the Co-operative Group 1,800 and Costcutter 1,700.

The last two have seen a significant decline in Tesco's performance. In 2013, Tesco reported its first drop in profits for 20 years. Tesco's sales are falling faster than any of the main competitors. Morrisons saw a drop in sales of 1.8%, Sainsbury's 3.1%. ASDA saw a rise in sales of 1%. Tesco's are losing market share to upmarket rival Waitrose and discounts Lidl and Aldi. Market share has dropped from 30.1% in 2013 to 28.8% in 2014. Waitrose experienced an increase in sales by 6.8%, Lidl 18.1% and Aldi 27.3%. The

retailer's position in the middle of being squeezed both ends – the premium and discount ends of gaining market share.

During 2014 a series of sackings and departures followed, resulting in Laurie McIlwee (Finance Director) stepping down (Quinn, 2014). Clarke was the only executive left on the board with retail experience. In July 2014 it was announced that Clarke would be stepping down, replaced by Dave Lewis from Unilever. This would be the first time an external CEO would be a helm of the business in over 90 years. In 2014, a whistleblower alerted the new CEO, Lewis, to a shortfall of £263m in the retailer's expected half-year profit (Warner, 2014). The shortfall was caused by Tesco booking income from deals with suppliers earlier than it should at the same time as pushing back costs. Tesco is currently being investigated by the Financial Conduct Authority (FCA) and the Serious Fraud Office (SFO). Four executives have been suspended, including the UK Chief Executive Chris Bush. The company hired Deloitte and its legal firm Freshfields to investigate the cause of the shortfall.

Lewis is now attempting to reverse Tesco's falling sales (Ruddick, Marlow and Rushton, 2014). To try to boost staff morale among the company's 300,000 workers in the UK, Lewis has launched a programme called 'Feet on the Floor' that requires staff in Tesco's offices, including the executives, to work in stores once a fortnight (Rickard Straus, 2014).

QUESTIONS

1. What is the Tesco share price history from 2010 to 2014? Identify key fluctuations in the share price and what events might explain the fluctuations?
2. What is the market share trend from 2013 – 2014 across the retail grocery sector? Identify factors which might explain the trends?
3. Where does the majority of Tesco's revenue and profits come from? What do you believe to be at the root of Tesco's decline in financial performance?
4. Has Tesco's business strategy changed in the last three years when new leaders have taken position, and if so, how?
5. How can issues relating to poor financial performance be addressed?
6. What is role of the human resource management function in turning Tesco's performance around?

BUSINESS STRATEGY AND THE ENVIRONMENT: TESCO PLC'S DECLINING FINANCIAL PERFORMANCE AND UNDERLYING ISSUES

Julie Haddock-Millar, Middlesex University Business School

Chris Rigby, Middlesex University Business School

CASE DESCRIPTION

The case presents a teaching tool which requires students to: 1) analyse the financial performance of Tesco Plc over the last four years; 2) compare Tesco's market position with key competitors; 3) identify and evaluate Tesco's business strategy; 4) evaluate the causes of Tesco's decline in performance; 5) develop recommendations to address declining performance; 6) identify and evaluate the Human Resource strategic role in addressing and supporting performance. The case is suitable for a business strategy or human resource strategy class. The case is appropriate for use at the undergraduate or masters level. Students should have some familiarity with business and human resource management strategy before being assigned to the case. Students might be assigned to work individually or in teams on the project. Individuals or groups may be required to present their research to the class for discussion and comment. Six to ten hours outside of class should be required to complete the case study exercise. Classroom discussion should be between two to three hours.

GENERAL COMMENTS

This case requires students to use research skills, analytical, evaluative and synoptic skills. It requires students to research information for a variety of sources, including, inter alia, company and business websites, journals articles and text books. The students then need to make decisions about what they believe to be the key drivers of business performance, weighing up and considering numerous factors. The case study requires students to think about the relationship between business and human resource management strategy and the functional areas of the business. The subject of alignment is not explicitly mentioned, albeit the implicit expectation is that students will refer to the importance of alignment in their discussion.

QUESTIONS

Question 1: What is the Tesco share price history from 2010 to 2014? Identify key fluctuations in the share price and what events might explain the fluctuations?

Solution 1: The share price history can be obtained via a number of different websites, including Tesco Plc. The share price history from 2010 to 2014 can be seen in Figure 1. Overall, the trend is consistently downwards, falling from £450.70 on April 23rd 2010 to £184.45 on November 7th, 2014. In 2013, Tesco reported its first drop in profits for 20 years. At this point, Tesco's sales were falling faster than any of the main competitors. This resulted in a drop in share value of 20% to £363.00. Following the announcement of the accounting practices under investigation in 2014, the share dropped again to £184.45.

Figure 1: Tesco Plc Share Price History 2010 – 2014

Source: <https://www.google.co.uk/finance?q=LON:TSCO&sa=X&ei=LSFhVMHFOqKS7Abax4DoBw&ved=0CCEQ2AEwAA>

Question 2: What is the market share trend from 2013 – 2014 across the retail grocery sector? Identify factors which might explain the trends?

Solution 2: The market share trends show the growth in premium brands (Waitrose) and discounters (Aldi and Lidl). The ‘middle’ market grocery retailers (Tesco Plc, Sainsbury’s) have lost market share primarily to polar opposites (see Table 3 and Figure 2). German discounters Aldi and Lidl have seen the most significant movement in market share, increasing year-on-year by 27.3% and 18.1% respectively.

The case study description notes “The grocery retail sector has seen a marked change in consumer shopping habits, caused by the economic downturn and modern lifestyle. Over the last two years, shoppers have switched from the large weekly shop to a convenience model, choosing to stop off at their local stores on the way home from work rather than visit a supermarket.” Alongside this, price conscious consumers are choosing to shop at the discounters, taking advantage of the cheaper prices. The prices are facilitated by lower cost models, less capital expenditure and a reduced range of products which enables up to 50% discounts on equivalent products in Tesco, Sainsbury’s and ASDA. Aldi and Lidl stock a high quantity of own brand products which enables them to compete on price. In the UK, Aldi has won the Supermarket of the Year by Which? for two years in a row (2012/13), and in 2013 Aldi won the Grocer of the Year Award. Consumers that want to shop for high quality ranges will go to supermarkets like Waitrose and Marks and Spencer, known for quality and service. All of these factors have influenced the trend which shows that the retailers that sit in the ‘middle ground’ are losing their stronghold in the UK retail grocery business.

Table 3: Market share data Oct 2014 vs Oct 2013

Grocery Retailer	October 2014 Market Share	October 2013 Market Share	% change
Tesco	28.8%	30.1%	(3.6%)
Asda	17.2%	17.3%	1.0%
J Sainsburys	16.1%	16.7%	(3.1%)
Morrisona	11.6%	11.9%	(1.8%)
Waitrose	5.2%	4.9%	6.8%
Aldi	4.8%	3.8%	27.3%
Lidl	3.5%	3.0%	18.1%

Figure 2: Retail Grocery Market Share Fluctuations 2013-2014

Source: <http://grocerynews.org/2012-06-16-08-27-26/supermarkets-market-share/grocery-stores>

Question 3: Where does the majority of Tesco's revenue and profits come from? What do you believe to be at the root of Tesco's decline in financial performance?

Solution 3: Despite Tesco's growth internationally, the lion share of the business still comes from the UK. Table 4, 5, 6 and 7 chart Tesco's performance over the last three years. Between 2011 and 2012 (see table 6 and 7) UK sales were over £47 billion, followed by £48 billion in 2012/13. Over the same period, the trading profit was over £2.4 billion (2011/12) and £2.2 billion (2012/13). The sales performance in the UK was similar in 2013/14 at over £48 billion. Trading profit saw a downturn of 3.6% year-on-year at just over £2.1 billion. Tesco's interim performance in 2014 indicates sharp fall in trading profit of 55.9%. The Asian and European markets have proved volatile over the three year period. In comparison to the UK market, the Asian market accounts for approximately 15% of group sales and 27% of group trading profit. The European market accounts for 18% of group sales and 10.8% of group trading profit.

There are a number of reasons for Tesco's decline in financial performance, including external forces driving down sales and profit and internal strategic business decisions. The UK market is underperforming, driven by the economic downturn, increasing fuel prices, growing strength of the high-end brands and discounters. During Clarke's time at CEO, Tesco launched a significant capital expenditure program to remodel hypermarkets to become destination shops, introducing Giraffe restaurants, coffee shops, buying into to 49% ownership of Harris and Hoole and Euphorium bakeries (BBC News Business, 2013). The business strategy behind the introduction of extended services was to encourage customers to visit destination shops, utilizing additional facilities such as dining out. However, the tide was turning in 2012/13 as more and more consumers switched to high street shopping, more regular convenience store shops and retail supermarkets operating a discount price focused business model.

Question 4: Has Tesco's business strategy changed in the last three years when new leaders have taken position, and if so, how?

Solution 4: There have been two new Chief Executive Officers since Sir Terry Leahy's departure in 2011. First Phillip Clarke took over, followed by Dave Lewis in 2014. During Leahy's time, Tesco pursued an international growth strategy, entering new markets such as Tesco banking and customer insight and significant investment in land and property throughout the UK. During the time, Tesco developed a 'broad church' product strategy, developing a Value range and Finest range and introducing a vast array of non-food items. This leads to the questions: can a grocery retailer be all things to all people? Following Leahy's departure, Clarke took over. Clarke pursued a strategy of investment in hypermarket superstores, destination shops. Arguably Clarke has too little time to demonstrate his potential as CEO as the decision

to invest in out of town destination shops was seen as a fundamental mistake. Clarke was quickly replaced by Lewis, an ‘outsider’ from Unilever. Lewis has been measured in his response, explaining that he will take time to survey the business and understand what the underlying issues are in relation to poor performance. Lewis’s immediate concerns are governance and auditing, with the announcement of an investigation by the Financial Conduct Authority and the Serious Fraud Office (Warner, 2014). However, he immediately recognized the need to be ‘customer-centric’, focusing on the target customer market (This Money, 2014).

Question 5: How can issues relating to poor financial performance be addressed?

Solution 5: Tesco’s previous CEO, Sir Terry Leahy recently commented: the company had “focused too much on what it isn’t, rather than remembering what it is ... what it is is a very big brand in the centre of the market, and clearly if you’re weak in the centre you can get attacked from all sides ... but if you’re strong in the centre and doing what you do well, it’s a good place to be – you can attract customers from all parts of the market.” (The Guardian, 2014). Strategic models that take an external perspective and internal perspective are useful in defining strategic approach and market position. Porter’s (1998) competitive analysis is probably the most widely used model for strategic analysis, identifying five fundamental forces which provide insight into the relationships and dynamics of the industry. This external perspective can see the ease of substitution in the retail grocery market and change in consumer trends which demand a more responsive strategic approach.

Management Today (2014) reported three strategic responses to turnaround the current performance issues:

1-Identify the target customer

“Tesco’s major strategic problem is that it is currently unclear about who it should target – the supermarket is caught somewhere between the more upmarket offer of Sainsbury’s and Waitrose and the discounters Aldi and Lidl. These discount rivals have put intense pressure on the UK’s major supermarkets in the last few years, and critics say Clarke failed to cut prices early enough to compete with the German discount brands.”

2-Brand identity

“In recent years, Tesco has been confused about its brand management and identity ... Tesco’s proposition, particularly in pricing, is muddled and confused ... Tesco doesn’t necessarily need to have the lowest prices to recover – instead its pricing needs more clarity, predictability and transparency.”

3-Management strategy

Tesco has experienced significant changes in leadership and management. During 2014 a series of sackings and departures followed, resulting in Laurie Mcllwee (Finance Director) stepping down (Quinn, 2014). Clarke was the only executive left on the board with retail experience.

What is clear is that the organization needs to look internally to understand what the brand is in 2014, what it wants to be in the future and establish a clear market position. Alongside this, the leadership and management team need to fully understand the market forces and how these shape the environment and business. Where will future market growth come from? What will be the future cash cow? Where are the rising stars and to what extent will these grow further? (Henderson, 1969).

Question 6: What is role of the human resource management function in turning Tesco’s performance around?

Solution 6: Over the last ten to twenty years the role of human resource management (HRM) in the wider business has shifted significantly. We now see language such as strategic partner and change agent (Ulrich,

1997), synergists (Caldwell, 2001) and HR leader (Ulrich and Brockbank, 2005). The language and roles types signal a move away from 'traditional' personnel roles to a more pro-active, strategic role where HR can make a real contribution to the organization. From the perspective of Ulrich (1997) HR needs to focus on activities which support the strategic direction of the business, including strategic planning and scanning the environment. In Ulrich and Brockbank's (2005) later model, the idea that HR plays a key role in corporate governance and acting as the organization's conscious is introduced. Lewis is in a position where corporate governance and accounting practices are at the very forefront of his review of Tesco. Here, HR can play a key role in working with functional areas to ensure corporate responsibility is at the heart of the business, ensuring the business operates in a responsible, sustainable, accountable and transparent way (CIPD, 2014). It is important to restore competence, integrity and confidence within all stakeholder groups.

Lewis has demonstrated the importance in focusing on the UK market with his new 'Feet on the Floor' initiative, seeing all head office personnel working in stores on a fortnightly basis to re-engage with the core business and get to grips with the business at the frontline (The Guardian, 2014). Lewis has also discussed the need to invest resources into UK supermarkets in order to improve service levels and stock availability. Alongside this, the capital expenditure on hypermarket superstores has stalled, shifting the strategic focus away from the destination shop to the core offer. HR can engage with the resource and capability agenda, aligning the organizational strategy with the HR strategy, policies and practices to facilitate capacity and capability, particularly across the core business.

Dr Julie Haddock-Millar is a Senior Lecturer (Practice) and Senior Teaching Fellow in Human Resource Management and Development at Middlesex University Business School. Prior to joining Middlesex University, Julie worked in a variety of business, project and human resource roles in the private sector, ultimately responsible for the talent management and development of 10,000 employees, across 36 stores with Tesco Plc. Julie completed her Doctorate in Professional Studies with Middlesex University in 2013. Her research focuses on employability and professional development, with a particular focus on early career entrants. Her professional practice involves working with organisations to develop a range of learning and development interventions, including the creation, implementation of mentoring programmes for employability and professional development. Between 2010 and 2013, Julie jointly led the Public Sector Mentoring Scheme in which a strategic response to the UK Cabinet Office need to encourage greater diversity at senior levels of the UK Civil Service was designed and delivered. Julie leads on a number of postgraduate programmes, including the MA in Further Education Sector Management Practice, helping to prepare College Principals for the next phase of their careers. She is a Senior Fellow of the Higher Education Academy, Academic Assessor and Chartered Member of the Chartered Institute of Personnel and Development, and was a finalist of the 2010 CIPD People Management Awards for her postgraduate research studies.

Chris Rigby is a Senior Lecturer (Practice) in Human Resource Management and Development at Middlesex University Business School. He has over 10 years of experience of working with organisations to ensure that strategy, systems and stakeholder interests are aligned. The earlier part of Chris' career was in secondary education and his transition to Higher Education has its roots in the completion of his MBA at Henley Management College in 2006 where he researched leadership development programmes to highlight the link between reflective practice and leadership development. His specialist areas include individual, team and organisational learning, professional practice, coaching, mentoring and action learning. Between 2010 and 2013, Chris jointly led the Public Sector Mentoring Scheme in which a strategic response to the UK Cabinet Office need to encourage greater diversity at senior levels of the UK Civil Service was designed and delivered. He currently leads postgraduate leadership development programmes within the public and private sector designed to recognise the transfer of learning into the workplace. He is an Associate Member of the Chartered Institute of Personnel and Development, a member of The European Mentoring and Coaching Council (EMCC) and holds the Professional Certificate in Coaching from Henley.

THE INFLUENCE OF CULTURE, GENDER AND EDUCATIONAL LEVEL ON ESCALATION OF COMMITMENT: COMPARISON JAPAN AND INDONESIA

Masako Saito, Osaka Sangyo University, Japan
Allison McLeod, University of North Texas, USA

ABSTRACT

This paper is an empirical analysis of what motivates students to study accounting, comparing students from the United States and Japan. The expansion of the International Financial Reporting Standards (IFRS) as a common business language requires significant changes in accounting education. In addition, the globalization has brought to light the significance of accounting education for professionals with more sophisticated knowledge to understand the IFRS and more experience to detect the frauds. Through our empirical outcomes, we discovered some interesting findings about the following: (1) the difference in students' motivation between students from the United States and students from Japan, (2) the positive impact of their self-efficacy and self-concept on their motivation, (3) the negative impact of where they are on their degree plan on their motivation, and (4) the moderation by perceptions of mastery, performance, and society goals in the relationship between self-efficacy and self-concept affecting motivation.

KEYWORDS: Motivation, Efficiency, Efficacy, Goals, Accounting Education

INTRODUCTION

Accounting education might be associated with the setting of accounting standards or the development of the IFRS rather than with domestic accounting standards. The International Financial Reporting Standards have already been adopted in most countries, providing a common global business language. However, knowledge of IFRS depends on the quality of the accounting education in institutions of higher learning. The International Education Standards (IESs) could be used as criteria for judging the value of global accounting education and training. The development of globally applicable IESs is challenged by the many different cultures, languages, and social, educational and legal systems (McPeak et al. 2012). Of course, universities need to motivate their students to learn, and motivation has a positive effect on students (Pintrich & Schunk 2002). However, as prior researches have shown, it is not easy for teachers to motivate students, because students sometimes lose their motivation or willingness to learn (Beghetto 2004). We suppose that such environment includes outside factors, like teaching methods, materials, and curriculum, and inside factors, like motivation, moral, and efforts.

THEORY AND HYPOTHESIS

This study is organized by examining the factors of self-efficacy or self-concept to the students' motivation. As the past researches noticed, self-efficacy or self-concept is affected by the students' home and family environments, and reflects the students' longing for jobs with higher social statuses (e.g., Lumsden 1994; Schunk 1995). Most factors are formed or based on the students' cultural background. Therefore, we suppose that there is a difference in students' motivation among countries. These factors can directly motivate students but can often spoil their motivation or willingness to learn. There might also be a gender difference in their motivation. Furthermore, the mastery, performance, and social goals might have some direct or indirect effects on students' motivation for leaning accounting.

RESEARCH METHOD

Based on the theoretical hypotheses, we develop multiple regression models with eight independent variables (self-efficacy, self-concept, mastery goals, performance goals, social goals, nationality, gender, and year of study). All of the above independent variables, except for nationality and gender, are measured on a five-level Likert scale (1: strongly disagree, 5: strongly agree). To eliminate the problem of collinearity among variables, we checked the variance inflation factors (VIF), which is a simple approach to identify collinearity among explanatory variables. We got the samples of 406 from Japanese students and 260 from American students and excluded 58 respondents because of incomplete surveys.

RESULTS

We examined the effect of self-efficacy and self-concept on the American and Japanese students' motivation to learn accounting. Our hypotheses 1 to 5 in the multi-regression model are statistically supported through the ANOVA analysis ($F = 46.830$, $p < 0.0001$). This means that students are motivated to study accounting when their self-efficacy or self-concept is high or when they set mastery goals, performance goals, or social goals for learning accounting. In addition, students' goals' perception moderates the impact between self-efficacy and motivation and between self-concept and motivation. Furthermore, we found the difference between nationality and students' motivation. This follows our prior discussion.

OUTSOURCING STRATEGIES AND THEIR IMPACT ON FINANCIAL PERFORMANCE IN SMALL MANUFACTURING FIRMS IN SWEDEN

Anders Isaksson, Chalmers University of Technology
Björn Lantz, Chalmers University of Technology

ABSTRACT

Outsourcing, i.e., the strategic use of outside resources to perform activities traditionally handled by internal staff and resources, have received increased attention in management practice around the world over recent decades. However, even though the main goal of outsourcing must be assumed to be improved financial performance, few researchers have been able to empirically establish this relationship. Furthermore, because most studies have been focusing on large firms, there is also a lack of knowledge on how small firms adopt outsourcing strategies. Therefore, the purpose of this study is to explore outsourcing strategies among small manufacturing firms, and to test how these strategies can be linked to financial performance. The study is based on questionnaire and financial data collected through a stratified sample of 700 small (<50 employees) manufacturing firms in Sweden (with a response rate of 56 percent or 400 firms). Measures of outsourcing were collected from the questionnaire, and performance indicators were collected from annual reports the next year. We used Principal Component Analysis to identify four outsourcing strategies: Back office activities, Primary activities, Accounting activities, and Support activities. However, in line with previous research, multiple regressions did not reveal any significant relationship between these strategies and financial performance.

KEYWORDS: Outsourcing, Financial Performance, Small Firms, Sweden

INTRODUCTION

Outsourcing, i.e., the strategic use of outside resources to perform activities traditionally handled by internal staff and resources, have received increased attention in management practice around the world over recent decades (Lankford, Parsa, 1999; Vining, 1999; Gottfredson *et al.*, 2005; McCarthy *et al.*, 2013). The reasons why firms decide to outsource vary, even if the most mentioned motive is often to achieve cost benefits and/or focus on core competencies. These two motives are often interlinked as one argument whereas managers use outsourcing in order to improve the use of capital investments by concentrating the firm's human and capital resources on its main activities (Quélin, Duhamel, 2003). Beside these main motives, other reasons for outsourcing mentioned in the literature are, to achieve best practice by acquiring access to external competencies (Kakabadse, Kakabadse, 2002) to transform fixed costs into variable costs (Alexander, Young, 1996), or as a tool in adapting to rapidly changing environments (Leavy, 2004).

An increase of the firm's internal focus on its core business is often assumed to result in performance improvements, and, as a result, an increased market value. Despite some research that shows a positive effect on outsourcing on firm value (Hayes *et al.*, 2000; Jiang *et al.*, 2007), the empirical evidence of the direct effect of outsourcing on firm performance is inconclusive. Furthermore, as stated by Jiang and Qureshi (2006, p 45) in their comprehensive review of the field “*previous work on outsourcing has been primarily theoretical in nature and has relied mostly on anecdotal evidence, from case studies, surveys or other self-reported data, to support assertions*”. Moreover, they state that (p. 46) “*we have located no studies with fully reliable quantitative indicators of performance across a statistically representative sample of firms*”.

The purpose of our study is to explore outsourcing strategies among small manufacturing firms in Sweden, and to test how these strategies can be linked to financial performance. By using a large sample of randomly selected firms, and analyzing performance with unbiased quantitative indicators, we will seek to narrow the research gap identified by Jiang and Qureshi (2006). Furthermore, by researching small firms in a Swedish context our study aims to fill two other research gaps; the lack of studies in a non-US context and the lack of studies on small firms.

First, from previous literature reviews of the field (e.g. Jiang, Qureshi, 2006; Bustinza *et al.*, 2010; Kroes, Ghosh, 2010), it is obvious that previous research in the area has been dominated by studies in a U.S. context, even though there are some noteworthy exceptions (Bustinza *et al.*, 2010; Bhattacharya *et al.*, 2013). We believe that there is a need for research from other cultural settings in order to better understand outsourcing behavior. To support this claim, there are several examples of how operations management practice differs in different cultural settings, for instance in the use of flexible manufacturing system (Darrow, 1987), the adoption of new forms of work organization (Cagliano *et al.*, 2011) or how national culture influences investments in manufacturing practices (Kalchschmidt, Mazzoleni, 2013). Hence, in order to get a more general knowledge on outsourcing strategies, and their effect on firm performance, we aim to contribute to previous outsourcing research by adding results from a Swedish context. Secondly, despite the fact that several researchers have proposed that there is a small firm effect on the use of outsourcing (e.g. Hayes *et al.*, 2000; Gilley *et al.*, 2004), we have found no study that has investigated outsourcing and its effects on a representative sample of small and medium sized firms, SME:s, (for a precise definition of SME:s see European Commission (2005)). Further, one reason why the study of SME:s is important is the fundamental role that they play in the economic activities, and growth, in society (Birch, 1979; Storey, 1998). For instance, in Europe SMEs account for 99.8% of all enterprises, 66.8% of total employment and 57.9% of total value added generated by the non-financial business sector (Muller *et al.*, 2014).

The difference between small and large firms is not only a matter of size. One important difference often highlighted in the literature is that smaller firms usually have a lower degree of structural complexity and bureaucracy vis-à-vis larger firms (Mintzberg, 1979), which increase their speed and flexibility in information-processing capacity (Chen, Hambrick, 1995). Several studies have also found that managers of small firms are often less prone to follow formal rational decision processes than managers from larger established firms (Smith *et al.*, 1988) and, hence, rely more on heuristics in their decision making (Busenitz, Barney, 1997). Other differences frequently highlighted are that the small business environment more often is characterized by higher levels of uncertainty about the market and technological development, due to the fact that these firms often are in early phases of their development (Wu, Knott, 2006). Furthermore, differences in access to critical resources (e.g. financial and human capital) and organizational structure can have important effects on how and why decisions are made, partly due to the effects these differences have on agency costs and information asymmetry issues (Ang *et al.*, 2000; Schulze *et al.*, 2001). Information asymmetry between owners and managers can for instance explain why operational decisions (e.g. to outsource or not) deviate from expected profit-maximizing capacity choices (Schmidt, Buell, 2014).

Finally, transaction cost theory suggests that the benefits of outsourcing would be higher for SME:s than for large firms (Klaas *et al.*, 1999; Gilley *et al.*, 2004). However, as pointed out by Verbeke, Kano (2012), for many small firms traditional wealth maximizing goals are subordinated noneconomic goals such as socio-emotional values, the importance of preserving a family control etc. For example did Memili *et al.* (2011) propose that family firms that value noneconomic goals higher than economic goals favor outsourcing less than those that do not.

The paper is structured as follows: Section 2 will give a short overview of current research on outsourcing and its effects. Section 3 explains our methodological approach, with a brief discussion of our data and

variables employed in the analyses. Section 4 presents and discusses the results of our analyses, and our concluding remarks are drawn in Section 5.

LITERATURE REVIEW

This section will aim to present a short review on relevant research on the effects of outsourcing (summarized in Table 1). Research has been identified through previous performed reviews (Jiang, Qureshi, 2006; Bustinza *et al.*, 2010; Kroes, Ghosh, 2010) combined with employment of different search engines for academic literature research, as Business Source Premiere, SSCI and Google Scholar.

Table 1: Sample Characteristics of Published Research on Effects of Outsourcing Included in Review

Authors	Country	Firm Size	Sample Size & Response Rate	Outcome Variable
(Hayes et al. 2000)	USA	n/a, mean sales \$7M	76 (n/a)	Stock market data
(Gilley, Rasheed, 2000)	USA	>50, mean emp. 259	94 (17%)	Self-reported
(Jiang et al. 2006)	USA	n/a (publicly traded)	51 (n/a)	Annual report
(Bolat and Yilmaz 2009)	Turkey	n/a (hotels)	110 (53 %)	Self-reported
(Bustinza et al. 2010)	Spain	>20 emp	213 (21%)	Self-reported
(Kroes and Ghosh 2010)	USA	Mean 1000 emp	233 (22 %)	Self-reported
(Bhattacharya et al. 2013)	Australia	n/a	5 case study	Self-reported

This table gives a summary of the main references mentioned in the literature review with a special emphasis on sample characteristics in order to better position our research contribution (the lack of studies on small firms in Europe with reliable quantitative samples and indicators).

Based on the hypothesis that outsourcing is considered to be a value-added business Hayes et al. (2000) investigated how information systems (IS) outsourcing announcements impacted the market value of publicly traded contract-granting firms. Of special interest to this study is that they managed to find that outsourcing announcements had a significant positive effect on small firms, whereas the effect on large firms was not significant. One theoretical explanation for this difference in market reaction was that due to higher information asymmetries (see e.g. Healy, Palepu, 2001) surrounding smaller firms, the market reacted significantly more positive to value-added announcements than for larger firms. However, it is important to note that the categorization of small firms in this study is based on the median size (of sales) of a sample of publicly traded firms, and not on any generally accepted definition of small businesses.

Gilley and Rasheed (2000) examined the extent to which outsourcing of both peripheral and near-core tasks influences firms' financial and nonfinancial performance on a sample of 94 manufacturing firms in the U.S. They did not find any significant direct effect of outsourcing on firm performance. However, an indirect effect on performance was found when using strategy (cost leadership vs. differentiation) and environmental dynamism as a moderator. One argument behind the moderating effect of strategy was that firms that pursue a cost leadership strategy are, by outsourcing, able to heighten their focus on their core competencies, and improve the quality of their nonstrategic activities.

Using the same sample as in Gilley and Rasheed (2000), Gilley *et al.* (2004) analyzed the effect of outsourcing of human resource (HR) activities (payroll and training outsourcing) on firm performance. As in their previous study, no effect was found on financial performance, but there was a small positive effect on firm innovation performance (R&D outlays, process innovation and product innovations) and stakeholder performance (employment growth & morale, customer and supplier relations). Based on the argument that human resource outsourcing would have a larger effect on smaller firms (due to transaction costs) they also tested for a moderating effect of size. However, no support was found for the hypothesis that HR outsourcing would be contingent on the size of the organization – maybe due to a relatively small sample size. Jiang et al. (2006) examined the impact of outsourcing on a firm's performance based on a sample of 51 publicly traded firms. Contrary to most previous studies on outsourcing effects they used annual report data to measure performance, and tested for changes in operating performances as a result

from outsourcing decisions. They provided some evidence that outsourcing improved firm's cost-efficiency (SG&A/sales and exp/sales) but did not find any effect on firm's productivity (sales/assets and asset productivity) or profitability (ROA and profit margin).

Bolat and Yilmaz (2009) examined the relationship between the outsourcing process, and perceived organizational performance in 80 hotels in Turkey, and found support for the hypothesis that outsourcing have a positive effect on organizational performance (organizational effectiveness, productivity, profitability, quality, continuous improvement, quality of work life, and social responsibility levels). Bustinza et al. (2010) studied 213 service firms in Spain, and concluded that there is a relationship between outsourcing decisions and company performance which is articulated via the impact of outsourcing decisions on the firm's competitive capabilities. They concluded that outsourcing encourages a development of resources that enables a sustainable competitive advantage.

In another study of U.S. data Kroes and Ghosh (2010) studied the degree of congruence (fit or alignment) between outsourcing drivers and competitive priorities, i.e., outsourcing decisions should be made in alignment with the competitive priorities of the firm. They also evaluated the impact of congruence on both supply chain performance and business performance. The main findings were that outsourcing congruence across all five competitive priorities was positively and significantly related to supply chain performance. Bhattacharya et al. (2013), using a qualitative research design, studied outsourcing in five organizations in Australia. Based on agency theory, they analyzed how the receiver and the provider of outsourcing services perceived outsourcing from different angles, e.g., areas of convergence and divergence. They found that the different parties often shared opinions regarding environmental uncertainty, conflict, information asymmetry and duration of contract, while differences were found regarding their view on degree of formality, opportunistic behavior, and mutual dependency of the parties involved, goal compatibility and switching costs.

DATA AND METHODOLOGY

The surveyed population consists of small Swedish manufacturing limited companies during 2012. Companies with less than 2 or more than 49 employees, with a turnover of less than 1 or more than 80 million SEK, with a balance sheet total over 80 MSEK, those being part of a business group, with more than one registered location, and without public annual reports from 2010 and 2011 were filtered out. The sampling frame then consisted of 7 635 companies. A stratified sample was conducted in order to ensure that the sample would be representative of the population. Companies were approached randomly by phone until 200 companies with less than 10 employees (i.e., micro firms) and 200 companies with 10 or more employees (i.e., small firms) had answered the questionnaire. Furthermore, in order to further ensure the validity of the sample, all data collection regarding the questionnaire was made by phone using an external service. A total of 700 companies were asked to participate, resulting in a response rate of 57 percent. Financial performance data regarding 2012 from these 400 companies were later collected through their annual reports from 2013. Financial performance was measured with the ratios Return on Assets (ROA) measured as income before interest expenses divided by total assets and Return on equity (ROE) measured as net income divided by Shareholders' equity.

The questionnaire included, apart from the standard demographic and other items, a section where respondents were presented with a list of 16 activities, and were asked to indicate the firm's outsourcing intensity of each activity: (1) Bookkeeping, (2) Financial reporting, (3) Tax Processing, (4) Payroll, (5) Billing, (6) Order processing, (7) Payment processing, (8) Other administration, (9) Manufacturing, (10) Purchases, (11) Warehousing, (12) Shipping, (13) Sales force, (14) IT services/system, (15) Customer Service, and (16) Training. A scale from 1 (the activity is performed entirely within the firm) to 5 (the activity is entirely outsourced) was used for each activity. The set of 16 activities is based on Gilley & Rasheed (2000). The respondents were also asked to indicate whether the strategic orientation of the

company preferably should be described as oriented towards differentiation or as cost oriented (based on Verhoef and Leeftang, 2009). The data were initially analyzed through a principal component analysis (PCA) in order to extract latent factors from the 16 manifest items. The latent factors can be interpreted as the basic outsourcing strategies of the companies. These factors were then used as explanatory variables in multiple regression analyses in order to explore the relation between outsourcing strategies and financial performance. The strategic choice between differentiation or cost, as well as the logarithm of the number of employees, was used as control variables for the regressions.

RESULTS

Table 2 presents the descriptive statistics regarding the degree of outsourcing of the various administrative and other activities in the companies. On average, most activities are not outsourced to any great extent. The obvious exceptions are items #2 and #3, and, to some degree, items #14 and #16. Some activities are almost always conducted within the firm, such as items #6, #10, #11, and #15.

Table 2: Descriptive Statistics Regarding Outsourcing of Activities

	ITEM	N	MEAN	STD.DEV.	SKEWNESS	KURTOSIS
Administrative activities	1. Bookkeeping	400	2.07	1.57	1.04	-0.62
	2. Financial reporting	400	3.99	1.39	-1.05	-0.29
	3. Tax Processing	397	4.16	1.42	-1.39	0.37
	4. Payroll	397	1.64	1.34	1.83	1.65
	5. Billing	399	1.26	0.93	3.50	10.77
	6. Order processing	397	1.12	0.65	5.59	29.93
	7. Payment processing	400	1.40	1.13	2.64	5.32
	8. Other administration	394	1.36	0.92	2.76	7.07
Other activities	9. Manufacturing	381	1.85	1.25	1.31	0.58
	10. Purchases	400	1.10	0.53	6.03	37.77
	11. Warehousing	390	1.20	0.70	3.96	15.73
	12. Shipping	388	2.32	1.66	0.68	-1.28
	13. Sales force	396	1.33	0.91	2.93	7.75
	14. IT services/system	389	2.69	1.53	0.25	-1.35
	15. Customer Service	396	1.17	0.64	4.30	19.19
	16. Training	374	2.78	1.45	0.19	-1.21

This table shows descriptive statistics across the participating firms regarding outsourcing intensity for each activity.

Barlett's test of sphericity was significant ($p < 0.001$) and the Kaiser-Meyer-Olkin measure of sampling adequacy was 0.829, indicating that the data is suitable for a PCA. The PCA was performed, and latent factors were built as averages of items. In our case, the one factor solution explains only 31.09 % of the total variance, and the analysis suggests a solution with four factors (considering eigenvalues above 1). Hence, the PCA indicates that there are four basic outsourcing strategies in these firms.

Table 4 presents the rotated component matrix from the PCA, where the 16 items are grouped into four principal components, reflecting four basic outsourcing strategies. For legibility, only the highest factor loading for each item is displayed here. The first component consists of six items with a Cronbach's alpha of 0.859. The component includes the items #1, #4, #5, #6, #7, and #8. We denote the component "Back office" since these items constitute the typical back office activities. The second component is denoted "Primary", as it includes the items #9, #10, #11, #13, and #15, that is, the activities directly related to the primary operations. Thirdly, the component "Accounting" includes items #2 and #3, which typically are performed by outside accountants. Finally, the fourth component is called "Support", as it includes activities necessary to support the primary operations in the firm, that is, items #12, #14, and #16.

Table 3: Total Variance Explained

Item	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %
1	4.97	31.09	31.09	4.97	31.09	31.09	3.70	23.13	23.13
2	2.12	13.22	44.31	2.12	13.22	44.31	2.86	17.88	41.01
3	1.57	9.80	54.11	1.57	9.80	54.11	1.93	12.06	53.07
4	1.22	7.65	61.76	1.22	7.65	61.76	1.39	8.69	61.76
5	0.98	6.12	67.88						
6	0.88	5.48	73.36						
7	0.81	5.06	78.43						
8	0.71	4.42	82.84						
9	0.56	3.49	86.34						
10	0.44	2.73	89.06						
11	0.37	2.29	91.35						
12	0.35	2.19	93.55						
13	0.32	1.99	95.53						
14	0.30	1.85	97.38						
15	0.24	1.49	98.88						
16	0.18	1.12	100.00						

This table shows the explained total variance for different number of factors in the PCA.

Table 4: Rotated Component Matrix and Factor Loadings

Item	Component			
	Back Office	Primary	Accounting	Support
1	0.634			
2			0.846	
3			0.849	
4	0.781			
5	0.833			
6	0.667			
7	0.855			
8	0.740			
9		0.543		
10		0.762		
11		0.813		
12				0.713
13		0.598		
14				0.537
15		0.809		
16				0.661
Cronbach's alpha	0.859	0.777	0.759	0.341

This table shows the rotated component matrix and factor loadings in the PCA. It reveals how four factors are constructed out of the 16 items. Extraction Method: Principal component analysis. Rotation method: Varimax with Kaiser normalization.

The next step was to test for relationship between the four outsourcing strategies and financial performance. Multiple regressions with return on assets (ROA) and return on equity (ROE) as dependent variables were conducted, with the four outsourcing strategies as explanatory variables while simultaneously controlling for company size and strategic company direction. Thus, the two tested regression models were

$$ROA = \beta_0 + \beta_1 BOF + \beta_2 PRI + \beta_3 ACC + \beta_4 SUP + \beta_5 SIZ + \beta_6 STR + \varepsilon$$

and

$$ROE = \beta_0 + \beta_1 BOF + \beta_2 PRI + \beta_3 ACC + \beta_4 SUP + \beta_5 SIZ + \beta_6 STR + \varepsilon$$

where

BOF is the average tendency to outsource back office activities

PRI is the average tendency to outsource primary activities

ACC is the average tendency to outsource accounting activities

SUP is the average tendency to outsource support activities

SIZ (control variable) is the logarithm of company size (measured as the number of employees)

STR (control variable) is a dummy variable describing whether the core company strategy should be described as oriented towards costs (value = 0) or differentiation (value = 1)

In both cases, the data set was first sorted by the dependent variable and trimmed so that the highest 5 % and the lowest 5 % were excluded. Hence, each regression was based on 360 observations. The results from the regressions are displayed in Table 5 and 6. Overall, the models explain very little. There are no significant relation between outsourcing strategies and financial performance measures.

Table 5: Relation between ROA and Outsourcing Strategies

	B	SE	T	P-Value
(Constant)	7.46	3.05	2.44	0.015
<i>BOF</i>	-1.32	0.72	-1.83	0.069
<i>PRI</i>	0.18	1.08	0.17	0.868
<i>ACC</i>	-0.37	0.47	-0.79	0.433
<i>SUP</i>	-0.53	0.57	-0.92	0.359
<i>SIZ</i>	2.38	1.64	1.46	0.147
<i>STR</i>	0.88	1.16	0.76	0.451

The table shows the results from the multiple regression analysis with return on assets (ROA) as dependent variable and the outsourcing strategies as explanatory variables. $F = 1.680$ ($p = 0.126$), $R^2 = 0.034$

Table 6: Relation between ROE and Outsourcing Strategies

	B	SE	T	P-Value
(Constant)	-20.76	25.26	-0.82	0.412
<i>BOF</i>	-5.24	5.98	-0.88	0.381
<i>PRI</i>	7.98	8.92	0.89	0.372
<i>ACC</i>	-4.04	3.88	-1.04	0.298
<i>SUP</i>	3.06	4.73	0.65	0.518
<i>SIZ</i>	24.61	13.53	1.82	0.070
<i>STR</i>	15.37	9.63	1.60	0.112

The table shows the results from the multiple regression analysis with ROE as dependent variable and the outsourcing strategies as explanatory variables. $F = 2.042$ ($p = 0.060$), $R^2 = 0.041$

CONCLUSION AND DISCUSSION

Decisions to outsource are usually assumed to be made in order to, directly or indirectly, improve financial performance. However, previous research in this field has essentially provided no evidence of a link between outsourcing and financial performance (Gilley and Rasheed, 2000; Gilley et al., 2004; Jiang et al., 2006). However, outsourcing as an explanatory variable has usually been treated on an entirely aggregate level (e.g. Jiang et al., 2006) or divided in outsourcing of peripheral activities and outsourcing of core activities (e.g. Gilley and Rasheed, 2000). In this paper, we have provided a more detailed typology of activities for which firms make strategic outsourcing decisions, and studied the relation between outsourcing intensities and firm performance.

Since we have been studying small firms and their actual financial performance, we have taken a step towards closing the previously identified research gap in the outsourcing literature. Furthermore, besides working with small firms and true financial performance measures, this study is also characterized by a relatively large sample size, a relatively high response rate, and a phone-based data collection – facts that indicate valid and reliable results in comparison with many similar studies. However, despite our relatively large sample, we were unable to find a significant relation between outsourcing intensity and financial performance.

The study has shown that small manufacturing firms have four basic outsourcing strategies; back office activities, primary activities, accounting activities, and support activities. However, as in previously related research, no significant relationship between outsourcing intensity and financial performance was found. This suggests that there may be other types of motives behind strategic outsourcing decisions than improved financial performance, perhaps especially among small firms. Hence, we believe that future research should explore the relation between outsourcing intensity and "soft" values like, for example, stress or work satisfaction. Another area of future research would be cross-country comparisons in order to better understand how management culture in different countries affects outsourcing behavior.

DETERMINANTS OF THE SILVER FUTURES PRICE VOLATILITY: THE CASE OF THAILAND FUTURES EXCHANGE

Woradee Jongadsayakul, Kasetsart University

ABSTRACT

This research studies determinants of silver futures price volatility in Thailand Futures Exchange using generalized autoregressive conditional heteroskedasticity (GARCH) model. The sample data consist of daily closing price, volume and open interest of silver futures from the period June 21st, 2011 to December 26th, 2012 for the nearby month contract with 376 sample data points. I construct data sample by switching or rolling over to the next maturing contract one day before the expiration date. The results from GARCH(1,1) model reveal that there is no significant relationship between volatility and time to expiration. There are a negative role for trading volume and a positive role for open interest in determining silver futures returns volatility. This analysis of silver futures volatility insists the Clearing House that margin requirements for silver futures should not be affected as the time to maturity of the contract decreases. The findings are also helpful to risk managers dealing with silver futures and predicting silver futures price volatility.

KEYWORDS: Futures Price Volatility, Silver Futures, Samuelson Hypothesis

INTRODUCTION

Derivatives products such as futures and options are great tools which investors can use to predict future spot prices and minimize their risk. Before trading futures in Thailand Futures Exchange (TFEX), investors are required to deposit initial margin with their respective brokers to ensure that they fulfill their futures contract obligations. Initial margin requirements for futures contracts on the same underlying across different maturities are set indifferently by Thailand Clearing House Co., Ltd. (TCH) and typically only 10 to 15 percent of the full value of the futures contract. At the end of day, brokers will calculate the profit and loss and add or subtract funds via a Mark-to-Market process. If the balance in the margin account falls below the maintenance margin level, investor will receive a margin call to top up his or her margin account so as to meet the initial margin requirement. One of the important factors affecting margin rate is futures price volatility. Therefore, understanding and characterizing futures price volatility has been a key issue in futures market research. Previous research has explained futures price volatility by variables such as time to maturity, volume, and open interest.

Samuelson (1965) states that volatility of futures prices should increase as the contract approaches expiration. It is widely referred to as the “Samuelson hypothesis”. The logic behind this conclusion is that the market is more sensitive to news regarding near-maturity contracts than more-distant contracts, which is indicated by greater volatility for the near-maturity contract (Ripple and Moosa, 2009). Numerous studies have investigated the Samuelson hypothesis empirically, and the hypothesis has been supported in commodity futures markets (Daal and Farhat, 2004; Duong and Kalev, 2008; Karali, Dorfman and Thurman, 2009; Karali and Thurman, 2010) and currency futures markets (Madarassy Akin, 2003). Samuelson hypothesis also holds in TFEX where SET50 futures price volatility (Dolsutham et al., 2011) and gold futures price volatility (Jongadsayakul, 2014b) increase as expiry approaches. However, using GARCH(1,1), Jongadsayakul (2014a) find the evidence of inverse maturity effect in case of crude oil futures traded in TFEX. Also, Chen, Duan and Hung (1999) find that the volatility of the Nikkei-225 index

futures price decreases when the contract is closer to its maturity. Futures trading activity proxied by volume and open interest is another important determinant of futures prices volatility. Numerous works have examined the relationship between trading volume and futures price volatility. Considerable evidence exists a positive correlation between futures price volatility and trading volume (Madarassy Akin, 2003; Xin, Chen and Firth, 2005; Kuo, Hsu and Chiang, 2005; Pati, 2006; Ripple and Moosa, 2009; Jongadsayakul, 2014a, 2014b); however, Bessembinder and Seguin (1993) suggest that the volatility-volume relationship might depend on the type of trader. Daigler and Wiley (1999) find that the general public drives the positive volatility-volume relationship whereas trading by clearing members and floor traders often exhibits an inverse relationship between volatility and volume. Moreover, Avramov et al. (2006) show that informed trades lead to a reduction in volatility while non-informational trades lead to an increase in volatility. The introduction of open interest as an additional explanatory variable is motivated by the fact that open interest and its change differ significantly from trading volume. The expectation is that open interest is negatively related to volatility (Xin, Chen and Firth, 2005; Feng and Chuan-zhe, 2008; Ripple and Moosa, 2009; Jongadsayakul, 2014b), as the availability of more contracts represents increased market depth, implying greater liquidity. However, Madarassy Akin (2003) and Pati (2006) find the positive relationship between open interest and financial futures price volatility.

This paper therefore examines the relationships between silver futures price volatility, time to expiration, and trading activity in TFEX using GARCH(1,1) model. The results from GARCH(1,1) model reveal that there is no significant relationship between volatility and time to expiration. There are a negative role for trading volume and a positive role for open interest in determining silver futures returns volatility. This analysis of silver futures volatility insists TCH that margin requirements for silver futures should not be affected as the time to maturity of the contract decreases. The findings are also helpful to risk managers dealing with silver futures and predicting silver futures price volatility. The rest of the paper is organized as follows. In section 2, I discuss earlier work related to explaining futures volatility. Then I describe the data and outlines the methodology in section 3. In section 4, I present empirical result from GARCH(1,1) model. Finally, I conclude the paper and summarizes the findings in section 5.

LITERATURE REVIEW

The literature contains numerous studies attempting to identify the important variables that influence futures price volatility. Samuelson (1965) states that volatility of futures prices should increase as the contract approaches expiration. It is widely known as the “Samuelson hypothesis”. His study is based on two assumptions, namely that: (1) futures price equals expected future spot price, and (2) the spot price is stationary following an AR(1): $P_t = aP_{t-1} + u_t$, where $E(u_t) = 0$ and $E(u_t^2) = \sigma^2$. Bessembinder et al. (1996) presents a new analysis of the economic issues underlying the prediction of greater volatility for the near-maturity futures contract. They show that the Samuelson hypothesis is successful without the two assumptions. In their study, the change in the log futures price (Δf_t) is the summation of the ex ante spot market risk premium (π), the unexpected rate of spot market price appreciation (u_t), and the change in the futures term slope weighted by the remaining time to expiration ($\Delta S_t \tau$). Therefore, the variance of futures price changes is

$$\text{VAR}(\Delta f_t) = \text{VAR}(u_t) + \tau^2 \text{VAR}(\Delta S_t) + 2\tau \text{COV}(u_t, \Delta S_t). \quad (1)$$

where VAR and COV denote variance and covariance, respectively. If $\text{VAR}(\Delta S_t)$ is a positive constant, then the variance of futures price increases with the square of the remaining time to contract expiration. Higher variance for more distant delivery date is inconsistent with the Samuelson hypothesis. Unlike $\text{VAR}(\Delta S_t)$, the sign of $\text{COV}(u_t, \Delta S_t)$ can be negative or positive. If $\text{COV}(u_t, \Delta S_t) < 0$, then the third term on the right side of (1) increases (toward zero) as the trading date approaches the contract expiration date. Therefore, their analysis implies that the Samuelson hypothesis requires negative covariance between spot returns and the slope of the futures term structure, which occurs in markets where prices are mean reverting.

The Samuelson hypothesis has been empirically supported in commodity futures markets (Daal and Farhat, 2004; Duong and Kalev, 2008; Karali, Dorfman and Thurman, 2009; Karali and Thurman, 2010) and currency futures markets (Madarassy Akin, 2003). Samuelson hypothesis also holds in cases of SET50 futures price volatility (Dolsutham et al., 2011) and gold futures price volatility (Jongadsayakul, 2014b). However, Chen, Duan and Hung (1999) find the inverse maturity effect in the Nikkei-225 index futures price volatility. Other studies also show that their results depend on the data and the methodology. Floros and Vougas (2006) find that the Samuelson hypothesis seems to be correct in simple linear regressions for both FTSE/ASE-20 and FTSE/ASE Mid 40 index. On the other hand, using GARCH models, there is no evidence to support Samuelson's hypothesis in FTSE/ASE-20 index over the whole period. However, using monthly series, GARCH models show a stronger support to the Samuelson hypothesis rather than linear regressions. Moreover, Jongadsayakul (2014a) shows that there is no significant relationship between crude oil futures price volatility and time to expiration in linear regression model while there is an evidence of inverse maturity effect in GARCH(1,1) model.

Futures trading activity proxied by volume and open interest is another important determinant of futures prices volatility. When trading volume increases, it increases the probability that prices will move into higher or lower regions, and that their volatility will be greater than before (Xin, Chen and Firth, 2005). On the other hand, trading volume can be used as a measure of the information flow. So when new and unexpected information arrives, both volatility and volume change contemporaneously and positively to new information. Numerous works identify a strong positive relation between price volatility and trading volumes (Madarassy Akin, 2003; Xin, Chen and Firth, 2005; Kuo, Hsu and Chiang, 2005; Pati, 2006; Ripple and Moosa, 2009; Jongadsayakul, 2014a, 2014b). However, Bessembinder and Seguin (1993) suggest that the volatility-volume relationship might depend on the type of trader. Daigler and Wiley (1999) find that the general public drives the positive volatility-volume relationship whereas trading by clearing members and floor traders often exhibits an inverse relationship between volatility and volume. Moreover, Avramov et al. (2006) show that informed trades lead to a reduction in volatility while non-informational trades lead to an increase in volatility.

Besides trading volume, open interest is important indicator of trading activity. It reflects the current willingness of futures traders to risk their capital in the futures position, which indicates the level of market depth (Bessembinder and Seguin, 1993). A high level of open interest could help to create market conditions that would reduce pressure from prices when trading provides new information (Xin, Chen and Firth, 2005). Several studies find that open interest is negatively related to volatility (Xin, Chen and Firth, 2005; Feng and Chuan-zhe, 2008; Ripple and Moosa, 2009; Jongadsayakul, 2014b). However, Madarassy Akin (2003) and Pati (2006) find the positive relationship between open interest and financial futures price volatility. Higher open interest means that there are more future trade expected and more opportunity for the prices to move into higher or lower levels. This implies an increase in current futures price volatility.

DATA AND METHODOLOGY

This study examines determinants of silver futures price volatility by using daily data downloaded from the websites of SETSMART and TFEX. The sample data consist of daily closing price, time to maturity, trading volume, and open interest of silver futures from the period June 21st, 2011 to December 26th, 2012 for the nearby month contract with 376 sample data points. I construct data sample by switching or rolling over to the next maturing contract one day before the expiration date. To analyze the volatility of silver futures price, I employ generalized autoregressive conditional heteroskedasticity (GARCH) methodology. On the basis of Akaike Information Criterion (AIC) and Schwarz-Bayes Criterion (SBC), MA(1,7,15)-GARCH(1,1) Model is chosen. Moreover, the basic GARCH specification is augmented by time to maturity variable and two trading activity variables, open interest and trading volume, in order to determine their relative contribution to the conditional variance. The following model is then estimated to investigate silver futures price volatility in TFEX.

$$R_t = \lambda_0 + \varepsilon_t + \mu_1 \varepsilon_{t-1} + \mu_7 \varepsilon_{t-7} + \mu_{15} \varepsilon_{t-15}; \varepsilon_t | \Omega_{t-1} \sim N(0, h_t) \quad (2)$$

$$h_t = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2 + \beta_1 h_{t-1} + b_1 m_t + b_2 q_t + b_3 o_t \quad (3)$$

where R_t is the futures return, which are obtained by taking the difference of log of futures prices, h_t is the conditional variance, m_t is the time to maturity, q_t is the trading volume, o_t is the open interest, λ_0 , α_0 , μ_i , and b_i are parameters, α_1 is the ARCH coefficient, β_1 is the GARCH coefficient. The sum of ARCH and GARCH coefficients indicates the degree of persistent in volatility.

RESULTS AND DISCUSSION

To study determinants of silver futures price volatility, the MA(1,7,15)-GARCH(1,1) is augmented by including time to maturity (m), trading volume (q), and open interest (o) as explanatory variables in the conditional variance equation. Then Bellerslev-Woodbridge's Quasi-Maximum Likelihood (QML) is used to estimate the MA(1,7,15)-GARCH(1,1) model. Table 1 presents the estimated results of MA(1,7,15)-GARCH(1,1) model, displaying the estimated coefficients and their P-values, as well as diagnostics tests and Wald test. The validity of the estimated model is assessed first by testing the standardized residuals for the presence of serial correlation and heteroscedasticity.

$$R_t = \lambda_0 + \varepsilon_t + \mu_1 \varepsilon_{t-1} + \mu_7 \varepsilon_{t-7} + \mu_{15} \varepsilon_{t-15}; \varepsilon_t | \Omega_{t-1} \sim N(0, h_t)$$

$$h_t = \alpha_0 + \alpha_1 \varepsilon_{t-1}^2 + \beta_1 h_{t-1} + b_1 m_t + b_2 q_t + b_3 o_t$$

Table 1: Estimation Results of MA(1,7,15)-GARCH(1,1) Model

Coefficient/Statistic	Estimated Value	P-Value
Conditional Mean Equation		
λ_0	-0.000527	0.4871
μ_1	-0.075919	0.1998
μ_7	0.059158	0.2481
μ_{15}	-0.105130**	0.0459
Conditional Variance Equation		
α_0	0.0000522	0.1630
α_1	0.178690	0.2225
β_1	0.507981***	0.0092
b_1	0.0000003	0.7573
b_2	-0.000262*	0.0651
b_3	0.000295**	0.0378
Standardized Residual Diagnostics		
Ljung-Box Q (36)	18.224	0.982
Ljung-Box Q ² (36)	38.456	0.236
LM ARCH (5)	8.2715	0.1419
Wald Test		
H0: $\alpha_1 + \beta_1 \geq 1$	-2.489872***	0.0064

This table shows the estimation results of MA(1,7,15)-GARCH(1,1) Model. Diagnostics tests based on LM ARCH (5), Ljung-Box Q (36), and Ljung-Box Q² (36) of residual and squared residual indicate that the estimated model is well fit. The sum of ARCH and GARCH coefficients is 0.686671, indicating that the persistent in volatility is not so high. Wald test shows its value statistically less than one, indicating that volatility process is covariance stationary, stable and evidences of mean reverting. Maturity is insignificant, whereas trading volume and open interest tend to be significant. *, **, and *** indicate statistically significant at the 10%, 5%, and 1% level, respectively.

Ljung-Box Q-test statistics up to lags 36 for serial correlation in the standardized residuals and standardized squared residuals are 18.224 (Prob. = 0.982) and 38.456 (Prob. = 0.236), respectively. Then a Lagrange

Multiplier test is employed to examine whether the standardized squared residuals exhibit additional ARCH. LM ARCH (5) test is 8.2715 (Prob. = 0.1419), which implies that the null hypothesis of no ARCH effects cannot be rejected and reveals that no further ARCH effects left in the standardized residuals. The insignificant Ljung-Box Q statistics and LM ARCH statistics implies that the residuals of the estimated MA(1,7,15)-GARCH(1,1) model are reasonably well behaved and adequately captures the persistence in the variance of returns.

From Table 1, the coefficient for the previous shock (the ARCH coefficient: α_1) is 0.17869 and that for its lagged conditional variance (the GARCH coefficient: β_1) is 0.507981. The GARCH coefficient (β_1) is highly statistically significant at the level of 1%. The sum of the two coefficients is 0.686671, which implies that the persistent in volatility is not so high. Since the Wald test shows the sum of the two coefficients statistically less than 1 at the 1% significance level, the volatility process is co-variance stationary, stable and evidences of mean reverting. Maturity is shown to be insignificant. The estimated coefficient of volume and open interest are -0.000262 and 0.000295 respectively, which are statistically significant at the level of 10% and 5% respectively. However, the signs for trading volume and open interest are not as expected. The results indicate that an increase in trading volume leads to a decrease in volatility due to higher informed trades in TFEX. An increase in open interest means that there are more future trade expected and more opportunity for the prices to move into higher or lower levels. This leads to an increase in current futures price volatility.

CONCLUSION

This research studies determinants of silver futures price volatility in Thailand Futures Exchange using MA(1,7,15)-GARCH(1,1) model. The sample data consist of daily closing price, volume and open interest of silver futures from the period June 21st, 2011 to December 26th, 2012 for the nearby month contract with 376 sample data points. I construct data sample by switching or rolling over to the next maturing contract one day before the expiration date. The results from MA(1,7,15)-GARCH(1,1) model reveal that there is no significant relationship between futures price volatility and time to expiration, whereas trading volume and open interest tend to be significant. However, the signs for trading volume and open interest are not as expected. The results indicate a negative relationship between the futures price volatility and trading volume variables, and a positive relationship between the futures prices volatility and open interest variables. Therefore, trading volume and open interest are the two important variables that explaining the price volatility of silver futures contract traded in TFEX. Since margin requirement is affected by futures price volatility, the results of this study will assist TCH in setting margin requirements. No consistent relationship between silver futures prices volatility and time-to-maturity indicates that the margin requirement should not be affected as the time-to-maturity of the silver contract decreases. The findings are also helpful to risk managers dealing with silver futures and predicting silver futures price volatility.

SMALL BUSINESS SUCCESS AND SOCIAL CAPITAL: A MULTI-CULTURAL APPROACH

Lillie M. Hibbler-Britt, University of Phoenix
Fiona Sussan, University of Phoenix

ABSTRACT

Although there has been a significant amount of work concerning critical success factors of small businesses and the importance of social media as a means of marketing a small business, there is limited work that investigates the impact of social media on small business success from a multi-cultural perspective. This study fills this gap and advances the knowledge as it relates to the incorporation of social media as a critical success factor. This quantitative study explores the use of social media as an integral part of the small business owner's strategy to be successful. The researchers investigated whether or not certain small business owner and business demographics impact the use of social media. In instances where social media is being used, the study sought to determine whether social media perceived as a critical success factor and are the business owners utilizing a strategic approach to the incorporation of social media. The outcome of this study will provide an indication of small and medium enterprise (SME) in New Jersey use of social media and will be the foundation for developing program(s) to help effectively incorporate social media into the SME's business development strategy.

INTRODUCTION

The Great Recession, the period of economic downturn from 2007 to 2009 had the most effect on Blacks, Hispanics, youth and low educated workers. Although the United States is in a period of recovery, recovery has been slower for these groups. Unemployment for Blacks still hover around 10.7%, Hispanics 7.8% and youth ages 16 to 19, is approximately 16.9%, while the United States average unemployment rate is 6.1% (Bureau of Labor Statistics, June 2014). Congregado, Golpe, and Van Stel (2012) states that during times of economic recession (high unemployment) individuals are pushed into self-employment, this is characterized as the recession-push hypothesis. According to Fairlie and Marion (2010) minorities and women often face discrimination in credit markets, which limit business formation, this limit in traditional funding often lead to the usage of nontraditional funding sources such as retirement funds and leveraging their homes. According to the Small Business and Entrepreneurship Council, in 2011 the U.S. Census Bureau reported 5.68 million employers in the United States, of which 99.7 percent had fewer than 500 employees, businesses with fewer than 20 employees accounted for 89.8%. Small businesses produced 46% of private nonfarm GDP in 2008. Small businesses accounted for 63% of net new jobs created between 1993 and mid-2013, approximately 14.3 million jobs. Although small businesses contributing to the US economic well-being, only about half of all new small businesses survive five years or more and only about one-third survive 10 or more years (Small Business Office of Advocacy, 2011).

The state of New Jersey is in line with the rest of the country, in 2011 approximately 50% of all business were under 500 employees, however, firms with fewer than 100 employees was the largest share of small businesses in the state. The largest gain in the number of small businesses in the state was among those in the firm size of 1-4 employees. In terms of the survival rate, only approximately one-third of small businesses in the state survive ten (10) years. This number is of significance when 23.3% of these businesses are minority owned (Small Business Administration, Office of Advocacy, 2014).

The low survival rate of small businesses and their contribution to countries GDP has made small business critical success factors the subject of numerous scholarly researches. Critical success factor analysis as it relates to entrepreneurs has been researched in many different areas, small hotel businesses in Turkey (Avcikurt, Altay, and Ilban, 2014), sector/industry involvement in Botswana (Gagoitseope and Pansiri, 2012), risk management systems (Yaraghi and Langhe, 2011), Spanish start-ups (Lafuente et al., 2013), human resources (Bonet, Armengot, and Martin, 2011); small business projects (Mueller and Jugder, 2012); business intelligence systems (Olszak and Ziemba, 2012), enterprise resource planning systems (Basaviah and Kini, 2013) small business legal formation (Chawla, et. al., 1997) and networking (Hoyos-Ruperto et. al., 2013). Johnson (2013) found that there were eight factors that were critical to e-market success: critical mass, integration issues, value proposition, leadership participation, industry knowledge, revenue model, branding and reputation and rich content. Although very little has been completed with regards to the use of social media as a critical success factor; the study conducted by Indrupati and Henari (2012) sampling small businesses in Puerto Rico, investigated entrepreneurial success, using an evaluation of online social networking. Social networking websites, along with other internet mediated communications channels have fundamentally changed how individuals relate to one another and how organizations interact with potential consumers. For example, Bevan, Ang, and Fearn (2014) suggest that a friendships accepted on Facebook is expected to continue for an extended period of time. In March 2014, Facebook had 8.2 million daily active users, 609 million mobile active users and 1.28 billion monthly active users, of these numbers approximately 81.2% of Facebook active users are outside the U.S. and Canada (fb.com, 2014).

This study seeks to determine the correlation between small business success and the use of various types of social media. To accomplish this the following research questions will be answered. 1. Does small business owners perceive the use of social media as a critical success factor? 2. Does the use of social media by small business owners vary based on cultural differences? 3. Does the education level of the small business owner impact the utilization of social media as a business strategy? 4. Does the years of operation impact the use of social media by small business owner? Does the use of a social media strategy improve small business owners' perception of the success of their social media activities? Does the age of the small business owner influence the use of social media as a critical success factor?

LITERATURE REVIEW

Critical Success Factors

Rockart (1979) defines critical success factors as activities that the management of an organization/company must concentrate on and do well, so as to move the company forward and to achieve the strategic objectives of the organization. Critical success factors are those tasks that must receive priority from management and must go well to ensure business success (Keck, Leigh, and Lollar, 1995). These should be a manageable number of items so as to facilitate a business owner's ability to give them the proper amount of focus, and affect the firm's competitive position within an industry (Keck, Leigh, & Lollar, 1995). The use of critical success factor analysis has been utilized in numerous studies as it relates to entrepreneurs. Johnson (2013) analyzed critical success factors as it relates to business-to-business e-markets. Chawla, Pulling, and Alexander (1979) used critical success factor analysis to determine the success factors during an organizations life cycle for small business owners in different business environments. When determining critical success factors for small and medium size enterprises (SMEs) researchers must first define success. As stated by Owens et al. (2013) success is typically defined by such economic measures as survival rate, growth in employees, sales growth, and profitability. Jasra et al. (2013) evaluated 250 SMEs in Pakistan and determined that financial resources, marketing strategy, technological resources, government support, along with entrepreneurial skills were critical to the success of small and medium size enterprises.

Social Capital Theory: Although many small businesses begin as the brain-child of one individual, the business' survival depend upon the inclusion, involvement and support of numerous others (Aldrich and Kim, 2007; Huanget al., 2013). Huang et al. (2013) reviewed data associated with early-stage entrepreneurial activities in 14 countries in the Middle East and North Africa (MENA). The researchers found evidence that socio-demographic variables such as gender, age, income and education, impact the entrepreneurs' usage of advice-seeking networks to grow their business (Huang et al., 2013). Social capital theory investigates the importance of relationships and how they facilitate instrumental action (Coleman, 1990). Of relevancy to this study are the concepts of weak tie theory which focuses on the strength of the social tie. Tie theory suggests that it is important that egos be connected to many alters and that they themselves are unconnected to other alters in egos network (Seibert, Krainer, and Liden, 2001). Per Seibert, Krainer and Liden (2001) these theories are not mutually exclusive, but function together because they focus on different points in the process of accumulating social capital (p. 221).

Expectancy Theory: Expectancy theory explains why individuals become entrepreneurs, an individual will act in a certain way based on the expectation that the act will be followed by a given outcome and the attractiveness of that outcome to the individual (Renko, Kroeck, and Bullough, 2012). Expectancy theory is also based on communications and information from other people.

Resource Theory: Per Keseljevic (2007) resource theory is integrally tied to social capital theory for this theory emphasizes understanding the organization as consisting of resources that are used to create a competitive advantage. Resource theory evaluates the impact of the availability of certain resources as a determinant of performance, adaptation, and exchange (Alvaro et al., 2010, p.2). These resources lend themselves to a firm's competitive advantage (Lockett and Thompson, 2001). The position is further supported by Chisholm and Nielson (2009) who found that social capital is embedded in relationships that extend outside of the organization and includes relationships with customers, suppliers and other external organizations. Social capital is a resource instrumental in corporate profitability and competitiveness (Chisholm and Nielsen, 2009). Runyan, Huddleston, and Swinney (2007) found that for small businesses both community brand identity and social capital were resources that helped small businesses to be successful. The authors determined that non-monetary resources must be leveraged in order for the small business to be successful.

Social Media Use: Lindegaard (2012) defines social media as "digital tools and services that facilitate involvement and interactions between different stakeholders, whether they are users or business partners, individuals or crowds, known or unknown". Also of importance when defining social media is the ability of the users to create and exchange "User Generated Content" (Kaplan and Haenlein, 2010) which takes control of what potential customers receive away from the company and place in the hands of either promoters or distractors of the company. According to Kietzman et al. (2011) social media allows the user to share, create, discuss, and modify information. It is this ability to modify information and to determine the recipient of the modified information that has transferred the power of marketing from the business owner to the consumer. Unfortunately, organizations have elected to "ignore or mismanage the opportunities and threats presented by creative consumers" (Kietzman et al., 2011, p. 242).

Ignoring social media is not an option, according to Mangold and Faulds (2009) who argues that the impact of social media is so great that organizations should consider a hybrid form of the promotional mix to include social media in the integrated marketing communications (IMC) plan. The various forms of social media (social networking sites, creativity sharing sites, content sharing sites, blogs, business networking sites, etc.) must be considered when developing IMC strategies (Mangold and Faulds, 2009). It is this paradigm shift that helps form the basis of this study, to consider the efficient and effective use of social media as a critical success factor for small and medium enterprises.

Through the use of social media, small business owners can extend their network of contacts to persons whom can assist in their business success dramatically. Per Lindegaard (2012) the use of social media helps to establish thought leadership and to build the business owners' brand. Fosso and Carter (2014) investigated the use of Facebook Events Page by SMEs. Their study involving 453 SME managers from Australia, the United States, the U.K. and India, determined that firms innovativeness, size, managers' age and business sector had an effect on whether or not social media was adopted.

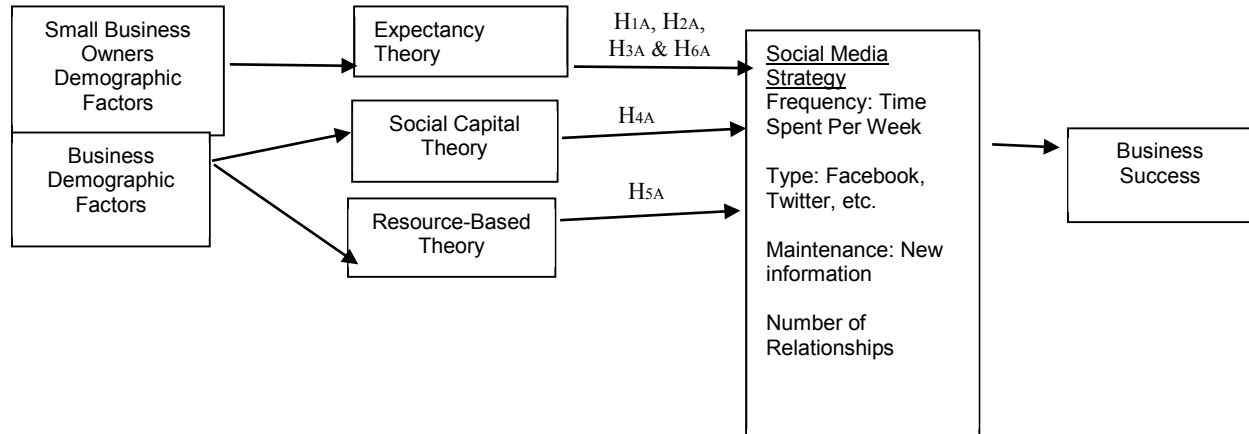

Within the context of social media, consumers belong to active online member, communities (Stephan, 2012). These communities develop and grow to become online societies. Stephan (2012) defines these societies as "a group of humans broadly distinguished from other groups by mutual interests, participation in characteristic relationships, shared institutions and a common culture (p. 166). Schroeder (2011) states that the "proliferation of social media networking sites means that it has become much easier to develop weak ties, which can be tapped to provide information or assistance, or to collaborate". Another position affecting the importance of relationships developed through social media is that, the use of the internet has become the primary source of information regarding companies, replacing the yellow pages, business directories and printed company literature (Schroeder, 2011).

Social media is a vital business tool for business owners (BDC—Social Media Guide) and as such it is necessary that small business owners develop a plan for incorporating social media into their overall business strategy. Properly utilizing social media can catapult a business to new levels of success. In fact, Mershon (2011) determined that small business owners benefited the most from the use of social media. Benefits included increased exposure (88%), increased traffic and subscriptions (72%), new partnerships developed (59%), improved sales (48%) and reductions in marketing cost (59%). Although the use of social networks and social media present opportunities to small businesses, Michaelidou et al. (2011) highlights several barriers to adoption of social media as a business strategy. These barriers include lack of money, time and training, negative views about usefulness and unfamiliarity with the particular technology (p. 1155).

Conceptual Framework and Hypotheses

The competitive advantage for any business lies in their ability to provide a superior product or service, the ability to attract and retain clients/customers, generate revenue and being innovative. Per Indrupati and Henari (2012) the traditional marketing strategies have become obsolete due to the capabilities of social media.

Figure 1: Theoretical Framework

Finances is a major concern of small business owners, especially since many entered into their own business because of being downsized from corporate America. Most small business owners are concerned with meeting the expenses that they can easily determine the return on investment. Since it is hard to quantify the effectiveness of using social media, small business owners are reluctant to expend time and money on developing a social media presence.

H1A: Small business entrepreneurs do not use social media to grow their business and therefore it is not perceived as a critical success factor.

Income and ethnicity has been found to play an important part in early computer adoption. Caucasians and Asians were found to be more likely to have a computer than Blacks and Hispanics. A study completed by Kamalu (2012) shows that the digital divide continues based on race/ethnicity, geography, education, age, urban vs. rural, and gender. It is this lack of exposure to technology that affects minorities' use of social media as a business strategy.

H2A: The use of social media by small business entrepreneurs vary based on cultural differences.

Education has been linked to obtaining wealth, this wealth is then used to purchase, install and use computers. Having and using computers at home breeds a familiarity that translates into the incorporation of technology into business activities. Education also allows for the understanding of the importance of certain business activities such as strategic planning and marketing for brand recognition. These activities are linked to business success.

H3A: The education level of small business entrepreneurs does impact the use of social media as a business strategy.

Organizations that have been in existence longer tend to become engrained in using the same processes to obtain business and are therefore less likely to utilize social media as a strategy to grow. Also, the longer a business has been in existence the older the owner, which has been found to reduce the likelihood of using technology.

H4A: The number of years that a company has been in business does affect the use of social media as a business strategy.

Small business owners recognize that in order to be successful all aspects of their business must have a strategy, including the use of social media. With a strategic plan intact, the small business owner can focus on areas of marketing that will tie their digital connections to specific aspects of business and develop their brands. A social media strategy will also allow the business owner to participate in the necessary customer/client analytics needed to drive success.

H5A: The incorporation of a social media strategy is perceived by small business owners as being directly tied to business success.

In relations to SMEs use of e-marketing tools to grow their businesses Dlodlo and Dhurup (2013) found that owners/managers between the ages of 40-49 and 50 years and over were less likely to use e-marketing tools. Therefore age will impact the perception of social media as a critical success factor.

H6A: The age of the small business owner does affect the use of social media as a critical success factor.

Empirical Research

This study will measure social media as one of the critical success factors of small business success. The variables to be considered are age, education (Huang et al., 2013), gender (Ross, 2010), years in operation and the use of a social media strategy. Questionnaires will be distributed to small businesses via Chambers of Commerce in New Jersey.

THE IMPLICATION OF AN ADVANCED DEGREE FOR NURSES IN HEALTH CARE

Susan J. Kowalewski, D'Youville College
Caroline J. Michalik, Roswell Park Cancer Institute

ABSTRACT

Current literature supports the promotion of nurses to the administration level focusing on areas that have shown positive outcomes such as improved patient care and staff satisfaction. An advanced degree in business or health administration is a valuable choice for nursing administrators in today's health care environment to provide the necessary education for these positions. The primary objective of this study was to determine the benefit to hospitals of an advanced degree in the role of hospital administrators; as well as to investigate the perceptions of current nurse leaders in the hospital setting and their application of an advanced degree in administrative roles. The study was conducted using a quantitative survey designed to evaluate the gaps in the role of the advanced degree and the nursing executive and their practice in the hospital environment. An online survey provided data related to specific perceptions that included recommendations for preparation of candidates for advanced nursing positions, methods utilized to assist nurses to advance, and the requirement of an advanced degree for such positions.

KEYWORDS: Advanced Degrees, Health Administration

INTRODUCTION

As the healthcare environment continues to change, it has become increasingly clear that hospital administrators must be optimally trained to manage an exceedingly cost-effective yet patient-focused organization. It is under this premise that the clinical leader has emerged at the executive level in hospital administration. Clinical nurses are an ideal choice for positions of leadership in healthcare organizations offers a unique perspective to patient care and administrative responsibilities. Trepanier and Crenshaw (2013) report that the ageing nursing workforce and the potential increase in demand for nursing services in the near future, nurse executives and other nurse leaders must actively prepare for prospective leadership roles. A registered nurse at the bachelor's level possesses the assessment and technical skills to care for patients. Individuals who progress clinically to the master's level further expand their skill set to include diagnoses and can prescribe for specific needs of the patient. With this strong clinical foundation it is only logical that advanced practice nurses continue their professional journey to become a more visible organizational presence in hospital administration.

Many nurse executives have achieved success through a range of roles and responsibilities. It is commonly accepted that nurse executives at a minimum need to pursue and obtain a graduate-level degree. For those who are interested in teaching in nursing programs, a masters degree in nursing (MSN) is required. For nurses interested in administrative opportunities, an MBA is a viable alternative. There are programs that offer an MSN/MBA. Those with advanced clinical expertise have the ability to gain additional credibility with nurses and other members of the multi-disciplinary healthcare team. For those without clinical practice background this rapport could be difficult to achieve.

According to Lavizzo-Mourey (2012), “to meet our nation’s health care needs, we must strengthen the nursing profession at all levels, from the front lines to the administrative ranks”. The role of the nurse executive continues to change based on healthcare reform, technologic innovation, consumerism and generational features. However, the need for the development of the applicable knowledge and expertise required is essential to ensure a nurse leader is competent to progress to the executive level. With an aging population of physicians and a limited volume of health care successors in place, there are an increasing volume of nurse practitioners replacing these physicians in primary care and hospital administration settings. There is however limited research specifically focused on the fiscal benefits to a hospital with nursing executives. The primary objective of this study was to determine if there is an added benefit of an advanced degree for those in hospital administration.

LITERATURE REVIEW

Sherman and Pross (2010) note the significant role of nurse leaders in developing and maintaining effective work environments. They also explored the development of leadership skills by using the Nurse Manager Leadership Collaborative Learning Domain Framework competency for development of leaders at the unit level. The Nurse Manager Skills Inventory is a foundational component of a comprehensive initiative of the NMLP to assist nurse managers in achieving their developmental goals throughout their careers. The resulting constructive environment is evident by staff satisfaction, employee retention, improved patient outcomes and improved organizational performance (American Association of Critical Care Nurses). Sherman and Pross (2010) indicated that there is an abundance of health care literature that continues to show the positive influence that expert, competent, credible and visible leadership has on supporting this framework related to nurse administrators.

The establishment of effective and efficient work environments necessitate leadership for nurses at all levels of the organization. The nurse leader supports all efforts to engage staff in achievement at the highest level by giving care providers the tools to assist in advancing patient care. Magnet recognition is highly recognized throughout healthcare organizations as the gold standard for quality patient care, nursing excellence with innovation in professional nursing practice. This status is also dependent on leadership grounded in new data and enhancements that support in quality outcomes.

Nursing administrators characteristically enter a career track at the unit level as a clinical care nurse; progressing to clinical nurse supervisors, and continue to develop into enhanced management positions. This career progression entails preparation and action. If skills and proficiencies for nursing administrators are developed, it would facilitate the hospital being able to adapt, prosper and expand; resulting in improved patient outcomes and enhanced staff nurse fulfillment. Kleinman (2003) evaluated data from the mid 1990’s that noted the importance of developing new paths for staff nurses to be promoted to the role of nurse manager based on clinical proficiency. The promotion of nurses without management and leadership background frequently resulted in unprepared administrators that were unaware of how to function in administrative roles or how to review unit-based operations.

Kleinman (2003) noted that the nurse administrator has developed qualities for success that requires business knowledge and skills. Nurse administrators work with clinical personnel, administrators, and patients. Strategic planning and accountability to the hospital board have become responsibilities of nursing administrators. Kleinman (2003) developed a survey of 35 nurse managers and 93 nurse administrators to assess the requirements of nurse administrators for role preparation within healthcare organizations. The results revealed that the nurse administrations that obtained master’s degrees were more likely to be clinical in nature than non-clinical. The skill set that were determined to be priorities for the nurse administrator focused on strategic planning, finance and human resources. The most desirable type of graduate degree was perceived to be a Master’s of Nursing and a joint Master’s of Business Administration for nursing administrators.

Executive nursing requires experience in clinical practice and business skills. Swanson and Stanton (2013) suggested that competencies are critical for nurse executives include a worldwide outlook or approach, a working knowledge of technology, expert decision-making skills, prioritizing quality and safety, politically judicious, collective and team building skills, balancing genuineness and performance expectations and coping effectively with change. Additionally these competencies should include effective communication, relationship management, financial management, medical staff relationship, change management and strategic management. Business degrees, specifically an MBA, provide the management education. Nursing executives' foster skills and competencies necessary to improve patient care and to train the next cohort of nursing leaders.

Although there is a lack of nursing knowledge specific to the MBA degree and its necessity for administrative positions in healthcare, there is an understanding of the positive influence such a degree provides. With healthcare reform occurring on a global level, nurses in administrative roles understand the importance of the skillset an MBA affords. Antrobus and Kitson (1999) identified the importance of developing nurses and examined the broader socio-political factors impacting nursing leadership. An ethnographic approach with informal semi-structured interviews specific to 24 recognized effective nursing administrators was utilized. The study investigated profiles of effective nursing leaders and their knowledge and skill set base. The perception of these leaders was that their knowledge derived from practice directly or indirectly influenced their leadership role. Further analysis revealed that nursing leaders had certain identifiable skills essential for the nurse administrator. This included working with others to empower other nurses to be a strategic thinker, integrating research evidence with practice, having a clear understanding of self, values, purpose and meaning as well as working well with others to achieve transformational change (Michalik et al, 2014).

These studies have shown that an advanced business degree for nursing administrators does show the positive outcomes and staff satisfaction that are created. Michalik and Kowalewski (2014) reported that a study by Aiken indicated the need for more extensive research regarding the educational composition of the nurse workforce and the role that it plays in administrative roles. The educational composition of the current workforce requires specific training for administrative roles however; educational models incorporating this additional training would need to be developed to more effectively train future administrators.

DATA AND METHODOLOGY

The study design for this research included a format that elicited personal numeric history such as years of experience and length of employment but also allowed for feedback that was unrestricted resulting in a span of results focusing on the qualities of nursing professionals and the role an MBA would play in health care management. This survey established basic demographics such as gender, and allowed for communication of subjective responses not limited to pre-designated replies. Since each nurse has different views on the role of an advanced degree and career progression, this survey allowed for a manifestation of support for what was already established in the literature search as well as create the need for additional research to evaluate the legitimacy of the current feelings expressed with regard to advanced degrees for nursing executives. The survey was distributed utilizing Survey Monkey via an email link to individuals on LinkedIn. The specific groups chosen for distribution of the survey were the American Organization of Nurse Executives, the American College of Healthcare Executives, and local Buffalo, New York healthcare executives.

RESULTS AND DISCUSSION

A total of 100 surveys were completed and reviewed; 85.86% female and 14.14% male representing a variety of levels of management representative of the hospital unit management level, director, CNO, President, COO, and CEO. Of the responses, the majority were unit managers or directors.

The number of years of healthcare experience spanned from five years to 50 years. The average years of a position held were between five to 10 years. Sixty percent of the respondents reported that their current positions held the requirement of an advanced degree; 73% obtained that advanced degree prior to their appointment. The degree's that were most represented were the Bachelor of Business Administration, Bachelor of Science in Nursing, Master in Business Administration and Master in Nursing. 80% of respondents agreed that a clinical degree should be required for those in hospital administration.

When asked how they were prepared for their administration positions the answers were varied. 28 respondents responded that they were given no preparation at all; while only 10 respondents felt they were prepared well for advancement opportunities. When questioned about the most accurate way to prepare an employee seeking an advanced position without an advanced degree, 52 recommended mentoring and coaching while only 11 felt an employee should not be offered a position unless they had already obtained an advanced degree. While the sample size is small and makes generalizability difficult, the results do offer insight into additional research that is needed in regard to this topic. The opportunities were either readily available for advancement or required an individual to leave the organization to obtain an advanced position. It is unclear if a clinical degree would affect this result. Although the degree obtained varied amongst respondents, over 60% had a Bachelor in business administration degree or non-clinical degree while only 50% of respondents had a Master of Nursing or clinical degree. Doctorate degree's comprised only 6% of respondents.

Although the respondents averaged between 25-40 years in healthcare, their average years in their current position were only between five to 10 years. It is unclear if this finding is common in most advanced positions or based is due to the small sample size. It would seem that any nursing administrator with 25 years of experience would be valued in an executive position and would remain in that position for greater than five years. However, a nurse administrator with over 40 years of experience although valuable, may no doubt be looking toward retirement limiting the length of time in their current role. If this were the cause, it would help to support the reasoning that nurses should be encouraged to advance in the organization beginning as early as possible in their career with organizational training and obtaining an advanced degree. These nurses would be able to give an extended period of service to the organization and their wealth of knowledge and experience could advance the organization (Michalik and Kowalewski, 2014). An advanced degree although required for 60% of the respondents in their current positions. As nurses progress in their careers, a master's degree whether clinical or business should be required for senior management in advanced positions. A Master's degree will prepare managers and directors at this level for the changing needs in healthcare in order to maintain a successful organization. Those reaching out for corporate positions may then make the decision to proceed to the doctorate degree.

The primary objective of this study was to determine if an advanced degree was beneficial to nurses in hospital administration. Based on the data collected, there is a significant difference in the number of males and females in administrative roles. An advanced degree has been a requirement for administrative appointments and was required prior to appointment to the position. Most respondents had the impression that candidates for advanced positions should come from within the organization and that networking should not be required. Instead they preferred to have an internal coach or mentor that would reach out to candidates exhibiting the qualities necessary for promotion. Although financial incentives and flexible scheduling were considered valuable incentives, most respondents seem to prefer a mentor and coach who

could guide and direct them in their career path. Additional responsibilities assigned under the direction of a mentor would allow the internal candidates to learn what was expected and encourage retention with the organization. Such responsibilities would include finance, human resources and medical staff affairs. Coaching and mentoring were further clarified within the survey to include either the CNO or an individual with an advanced degree in the organization that could assist with the skills needed for progression. Administrative competencies need to be developed even for those who have completed advanced clinical degree programs. This should include business skills in order to combine clinical knowledge with business operations. The nursing administrator is respected for their similar clinical skill set of those they manage. Increased responsibilities that nursing leaders can impart are the ability to set clinical goals for the organization that are attainable and to communicate and collaborate those goals throughout the organization to those they mentor. Critical thinking based on previous clinical experience is one of the advantages of the nursing administrator; an advanced business degree would guide them to make critical decisions. As healthcare continues to change, the methods utilized for patient care will continue to change and as the hospital organization continues to reform the practice of healthcare it will require decision-making that is creative and idealistic.

Sanford (1994) reported that “chief executive officers (CEOs) felt that the best education of nurses in administration was a bachelor’s degree in nursing, combined with an MBA.” It appears an MBA provides a better background for the necessary skill set for nurses promoted to positions in administration. One response by institutions of higher education have been marketing MBAs to hospitals and health care facilities and the creation of a hybrid graduate degree, the MSN/MBA. Tuition reimbursement though available at many hospitals, does not entirely compensate monetarily for master’s and doctorate degree programs. It has been suggested that hospitals choose prime candidates within the organization and fully pay for the entire cost of an advanced degree (MBA) in order to encourage nurses to continue on in their education. An increase in salary may help to off-set this expense however most hospitals will likely not give an advance without a promotion.

CONCLUDING COMMENTS

If hospitals were to promote from with-in it would require executives to search out viable candidates in the organization and take the risk of assisting financially with the expectation that the candidate would complete the program and stay with the organization. Many candidates if promoted or given financial reimbursement frequently leave the organization for more advanced opportunities or better financial compensation. Networking is a very viable option for those who aspire to advance in their career. It creates mentor opportunities as well as a variety of potential job placements. Networking provides a sense of the current healthcare environment and the direction needed for change. With multiple perspectives available to the nurse looking to climb the ladder, they will quickly build their business sense and plan for any changes that may be necessary. Although it may seem easy to require an advanced degree for any newly appointed nurse executive, many qualified nurses in today’s healthcare environment have been in healthcare for many years and are not eager to return to school at a time so close to retirement. These candidates should not be overlooked because of their multitude of experience. These individuals should be mentored and coached and encouraged to set obtainable goals that will allow them to accept an advanced role while working to achieve their advanced degree.

Incentives suggested for preparing internal candidates for advancement included tuition reimbursement, mentoring, seminars and webinars focusing on leadership development as well as additional responsibilities within the organization to grow professionally. Succession planning that is hardwired within the organization was a suggestion given for internal advancement, however this would require hospital organizations to develop specific curriculum or to partner with a particular university to offer such training to employees. Less costly options included mentoring from those in the organization that had already obtained an advanced degree as well as tuition reimbursement, flexible scheduling and salary incentives.

Hospitals will need to better prepare those hoping to advance in the organization. The transition from clinical care to the ranks of administration is not always a seamless one. Clinical expertise and experience frequently do not provide the background necessary for today's administrative roles. Without the prerequisite education, aptitudes, and capabilities; administrators can be deemed ineffectual and unable. An MBA with its formal business education has been shown to be relevant for the role of nursing administration; providing needed skill education for success.

An advanced clinical degree most likely should not be required for those in the Chief Financial Officer position of the hospital organization; however an argument can be made to show the benefits of a clinical degree for those at the corporate level including the president, vice president, chief operating officer and chief executive officer. Without a clinical degree these personnel cannot completely have their finger on the pulse of healthcare changes unless they understand the implications that any financial changes may have on the foundation of clinical care. The dual MSN/MBA appears to be the best alternative for nurses moving into administration; providing additional clinical as well as the business education fulfills the educational requirements. Any nurse looking to advance their career needs to seek out opportunities and accept any opportunity that presents itself. The more assignments, situations and challenges that a nurse can expose themselves to will prepare them for an advanced role.

These opportunities will no doubt take them outside of nursing, but they will continue to have a great effect on patient care and lead will provide value to the organization. Healthcare leaders need to have knowledge in health and social policy as well as management and research. However nursing practice is key and cannot be lost in the process since this is the foundation of patient care. Career paths for nurses should be revised to include political, managerial, academic and clinical domains. This study has provided an analysis of the current literature within the context of nursing administration and the role of an advanced degree. It has examined nursing leadership and questioned the value that a nurse executive can provide in senior level and corporate administration roles. In addition it has shown what possibilities are available for growth of those looking to advance to higher levels of the hospital organization.

THE ROLE OF INFORMATION SYSTEMS IN ENHANCING THE PERFORMANCE OF THE PHARMACY COUNCIL OF GHANA

Kwabena Obiri-Yeboah, Kwame Nkrumah University of Science and Technology, Ghana
Eliezer Ofori Odei-Lartey, Kintampo Health Research Centre, Ghana
Kenneth Simmons, Ashanti Regional Pharmacy Council, Ghana

ABSTRACT

This study investigates the role of information systems in enhancing the performance of the Pharmacy Council. The role of IS on the performance of organisations has received significant attention in literature. This study seeks to identify the current information systems in the operations of the Pharmacy Council, determine the human resource capacity available at the Pharmacy Council for operating information systems, assess the perceived value of information systems among Pharmacy Council staff and pharmacy operators and to solicit views on challenges with the use of information system at the Pharmacy Council. Primary data was collected through questionnaire administration and interviews. Questionnaires were administered to one hundred and thirty-six Pharmacies that were conveniently sampled from the total number of Pharmacies licensed by the Pharmacy Council within the Ashanti region and thirty-two staff from seven regional offices and the head office of the Pharmacy Council. Literature reviewed reveals that studies examining the association between IS and organisational performance are divergent in how Information Systems impact on performance. From this study there is an indication that Information Systems present great potential for the Pharmacy Council to reengineer its processes to meet the current global trends and improve on its performance. This will require the provision of adequate computers, appropriate software and training for both staff and pharmacy operators. It is recommended that the Pharmacy Council should consciously examine all its frequently recurring services and formulate strategies to computerize them to enhance their performance.

INTRODUCTION

Institutions would ideally want to make decisions which will benefit them and their stakeholders, and ensure these decisions are made accurately and timely. Decisions are made based on available information, which is normally derived from processed data. Coming out with good decisions will depend on the information that is available and when it is made available. Thus, data must be processed accurately and timely and must be easily accessible when needed. Information systems are actively adapted to process data. The benefits inuring from making good decisions as a result of the proper implementation of information systems could be a competitive advantage for an institution.

The business value of I.S. has received considerable interest from the business community due to the increased realization that it potentially improves productivity and has significant impact on business performance. For most organisations information systems has changed the way in which they conduct business. Information system is also regarded as a strategy of gaining competitive advantage sources.

Perception of information systems as a strategic way of enhancing or improving the efficiency of businesses is not exclusive to developed countries. Governments the world all over have recognised the importance of information systems to the development of their countries. The Government of Ghana (GoG) also recognizes the importance of information technology to improve the service delivery of public institutions. To this effect, the GoG developed a policy document for the country, the Ghana ICT for Accelerated development (ICT4AD 2003). In this policy document government seeks to deploy information systems to help improve service delivery by civil and public institutions to the public.

Although the use of Information systems is increasing in Ghana, it does not mean that all organisations especially public institutions are able to derive value from it. But regardless of this, organisations continue investing in IS. It can be also seen that most of these organisations have computers and other forms of information technology but how are these being used within the organisation to enhance their operations? How is information systems and IT being implemented in public organisations to assist in data gathering and processing within the organisations to help them achieve these objectives?

The Government of Ghana acknowledges this in its policy document that the mere deployment of ICTs within public sector organizations and institutions does not necessary translates into improvements in productivity, efficiency and service delivery which collectively could impact on the overall developmental process of the country. The GoG suggests that, the deployment of ICTs within public institutions and business organizations and entities will have little or no impact on the nation's development process if not accompanied by a number of organizational and procedural changes as well as changes in attitude to work and work ethics (ICT4AD 2003). So the question here is, are public organisations moving in line with the government of Ghana's policy objectives as outlined for them in the ICT4AD? Another reason why organisations may not derive the business value of information systems in organisations is embedded in the phenomenon that information systems create business value indirectly but create business costs directly, making the value of information systems and the benefits thereof difficult for organizations to perceive.

The Pharmacy Council as a government institution has computers and other forms of IT equipment at their disposal. They could be used to enhance the service delivery of the Pharmacy Council (PC) by improving on their service delivery capacity. This study explored the prospects and challenges of using information systems in government institutions in Ghana. In this study, we assessed the role of IS in enhancing the performance of the PC of Ghana in managing client information by identifying the current IS in operation, determining the human resource capacity available at the Pharmacy Council for operating information systems and soliciting views on the perceived value and challenges of IS from both staff and clients of the PC.

LITERATURE REVIEW

An information system is defined by Biswas (2005) as “an integrated set of components for collecting, storing, and processing data and for delivering information, knowledge, and digital products”. According to Farooq (2005) “business firms and other organizations rely on information systems to carry out and manage their operations, interact with their customers and suppliers, and compete in the marketplace”. According to Gupta (2000), any specific information system aims to support operations, management and decision making. DeLone and McLean (1992) identified six factors for the success of information systems, namely system quality, information quality, system use, user satisfaction, individual impact and organizational impact.

The impact of information systems on the performance of end users and the relationship between information systems and performance and productivity has been of great interest to many researchers (Hostler et al, 2005). A large number of researches have been associated with the performance of end-user including Davis (1993) using the technology acceptance model (TAM). Various studies have been

undertaken to measure the impact of IT on management performance (efficiency & effectiveness) of business organizations using different performance indicators which according to Dyson (2001) are considered key factors. These variables capture all activity levels and performance measures and common to all units and cover the full range of resources used. These variables include income, customer satisfaction, supplier/customer links, company image, job interest of employees, stakeholder confidence, inter office links.

Witzel (1998) looks at the origin of efficiency and finds that it has two meanings: technical efficiency or ensuring that systems and process work to their optimal level, and total efficiency or ensuring that the organization as a whole is fit to meet its goals. Performance as stated by Wheelen and Hunger (2000) is an end result of an activity and an organizational performance is accumulated end result of all the organization's work process and activities. Managers measure and control organization performance because it leads to better asset management, to an increased ability to provide customer value, to improve measures of organizational knowledge and measure of organizational performance do have an impact on an organization's reputation.

The most frequently used organizational performance measures include organizational efficiency (productivity), organizational effectiveness and industry ranking (Wetherbe, 1999; Turban, et al, 1999 & 2001). Researchers like Huber (1996), Parthasarthy and Sethi (1993), Kelly(1994), Earls(1996), Rumizen (1998), O'Dell(1999) etc. have investigated the impact of IT on incomes/profits of the companies and found positive impact. Whereas, Farkline (1997), Marton and Chester (1997), Olalla & Fassas (2000), Schmidt et Al (2001), Zee (2004) etc. have seen the increase/decrease in above qualitative factors after implementation of IT. They have concluded that IT has ultimately increased company image, job interest of employees, stakeholder confidence, interoffice link etc. This study measures the organizational performance in respect of increase/decrease in income/profits and number of employees of Pakistani companies operating in banking and manufacturing sectors with a relation to IT implementation.

Despite huge investments in information systems in recent years, Hostler et al (2005) suggest that the effects of information systems performance have proved extremely difficult. This relationship is multifaceted and includes several aspects such as the user's work, tasks and system quality, and information quality.

DATA AND METHODOLOGY

The study was conducted among staff in all ten (10) regions of the Pharmacy Council of Ghana. The study also included one hundred and thirty six (136) conveniently sampled from an alphabetically order list of four hundred and twenty (420) pharmacies registered with the Pharmacy Council in the Ashanti Region. With regards to the selection of pharmacy operators, factors of proximity, availability and willingness to participate were key determinants. Also, the sample excluded other pharmaceutical service providers such as licensed over the counter medicine sellers. This may place limitations on the extent to which this study can be generalized within the context of the Ghanaian pharmaceutical service providers. However, since activities do not vary within the organization there may not be wide deviations from what pertains with other service providers.

Primary data was collected through structured interviews. Questionnaires were designed for this purpose with with a mix of closed-ended and open-ended survey questions. Reliability and validity of questions were assessed by repeating some questions. Questionnaires were interviewer-administered to staff of the pharmacy council on one hand, and managers and owners of the pharmacies on another.

Microsoft Excel Spreadsheet 2007 was used to analyse frequencies and percentages of closed end responses. Regression and logistic regression analysis were performed with *STATA 12*. Open-ended qualitative responses were through data reduction and conclusion creation.

EMPERICAL RESULTS

Socio-Demographic Characteristics of Staff Interviewed

Summary statistics on the socio-demographic characteristics of respondents from the Pharmacy Council staff are presented in Table 1. The summary statistics show the distribution of the respondents by sex, age grouping, regional office, department, position, level of computer knowledge/experience and access to use a computer at the department. Also presented are the percentage proportions for the distributions, relative to the total number of respondents. The age distributions are presented in six groupings, each with a ten year range up till age sixty and above.

Table 1: Socio-Demographic Characteristics of Staff Interviewed

	Frequency	Percentage
Sex distribution		
Male	21	67.74
Female	10	32.26
Missing	1	3.13
Total	32	100.00
Age grouping	Frequency	Percentage
20-29	3	9.68
30-39	12	38.71
40-49	9	29.03
50-59	7	22.58
60 and above	0	0.00
Missing	1	3.13
Total	32	100.00
Distribution of staff by region	Frequency	Percentage
Eastern	4	12.90
Ashanti	4	12.90
Western	2	6.45
Northern	1	3.23
Volta	3	9.68
Greater Accra	17	54.84
Missing	1	3.13
Total	32	100.00
Distribution of staff by department	Frequency	Percentage
Inspectorate	14	49.11
PPME	4	14.29
MIS&P	3	10.71
R & L	2	6.25
Accounts	4	14.29
ETD	1	3.57
Missing	4	12.50
Total	32	100.00
Distribution of staff by position	Frequency	Percentage
Accountant	4	17.39
Inspecting Pharmacist	2	8.70
Manager	11	47.83
Pharmacy Intern	1	4.35
Procurement Officer	1	4.35
Secretary	4	17.39
Total	23	100.00

Results from Table 1 indicate that majority (67.74%) of staff respondents are males. This suggests that the number of male staff is more than twice the number of female staff at the Pharmacy Council.

Results on the age distribution of staff respondents indicate that the ages of most of the staff respondents range from thirty (30) to forty (59) years. The age distribution of respondents from the Pharmacy Council staff reflects majority of the workforce fall within the active age of workers in Ghana.

The distribution of staff respondents by the regional offices where they work, as presented in Table 1, indicate that over fifty per cent of staffs interviewed are located in the Greater Accra region. The very high number of responses from the Greater Accra region was because this region has two Pharmacy Council

offices; the Greater Accra regional office and the head office. Responses from both the Greater Accra regional office and the head office were combined.

With regards to distribution by departments, (49.11%) of the respondents were at the inspectorate department. The twelve staffs under the inspectorate department are distributed among the regions. All other departments however are at the head office of the Pharmacy Council. Results on the position/rank of staff also indicate that (47.83%) of the respondents held managerial positions. The number of managers interviewed was high because almost all managers at each regional office were respondents. Other staffs holding different positions (Table 5) are mostly from the head office.

Opinions from Pharmacy Council Staff on the Computerization of Processes/Services

Responses were received concerning the extent to which Pharmacy Council staffs agree with the computerization of certain operations of the Pharmacy Council. Summary statistics of the responses is presented in Table 2. Results from the statistics indicate a high number of respondents agreeing with computerization of the listed operations of the Pharmacy Council

Table 2: Summary statistics on staff opinion about the computerization of listed processes/services

Processes/Services to computerize	Opinions from pharmacy council staff						Total
	SA	A	I	D	SD	Missing	
Application for Relocation	22 68.75	6 18.75	2 6.25	1 3.13	0 0.00	1 3.13	32 100.00
Application for a New License	21 65.63	6 18.75	1 3.13	2 6.25	1 3.13	1 3.13	32 100.00
Renew License	27 84.38	3 9.38	1 3.13	0 0.00	0 0.00	1 3.13	32 100.00
Enquiries	17 53.13	8 25.00	3 9.38	2 6.25	0 0.00	2 6.25	32 100.00
Registration	24 75.00	4 12.50	0 0.00	1 3.13	0 0.00	3 9.38	32 100.00

Source: (Author, 2014)

The relatively high strong approval from the staff respondents to computerize the renewal of license may be attributed to the fact that this activity is the most commonly recurring among the others. The few responses that disagreed to computerization of some of the services suggest that some staff have not yet adjusted to the use computers in their duties.

Opinions from Pharmacy Operators on the Computerization of Processes/Services

With regards to the extent to which pharmacy operators agree with the computerization of certain operations of the Pharmacy Council, summary statistics presented in Table 3 indicate that a high number of respondents agree with computerization of the listed operations of the Pharmacy Council. A relatively low proportion of pharmacy operators however do not strongly agree with the computerization of enquiry services.

Opinions from Pharmacy Operators on Service Delays

Responses were received from pharmacy operators on the latency of service delivered by the Pharmacy Council. Summary statistics of the responses is presented in Table 4. Results from 75 respondents indicate that 58.67% of operators experience up to five months delay in service delivery from the Pharmacy Council.

Table 3: Summary statistics on client opinion about the computerization of listed processes/services

Processes/Services to computerize	Opinions from pharmacy operators						Total
	SA	A	I	D	SD	Missing	
Application for Relocation	71 52.21	50 36.76	7 5.15	2 1.47	0 0.00	6 4.41	136 100.00
Application a New License	81 59.56	36 26.47	7 5.17	3 2.21	0 0.00	9 6.62	136 100.00
Renewal of License	99 72.79	30 22.06	2 1.47	1 0.74	0 0.00	4 2.94	136 100.00
Enquiries	88 64.71	37 27.21	3 2.21	1 0.74	0 0.00	7 5.15	136 100.00
Registration	97 71.32	30 22.06	1 0.74	2 1.47	0 0.00	6 4.41	136 100.00

Source: (Author, 2014) Similar to responses from staff respondents, results suggests that pharmacy operators also strongly allude to the computerization of renewal of license for possibly the same reason that it is the most commonly recurring process.

Table 4: Summary statistics on client opinion on service delay

Service Delay	Frequency	Percentage
One day	13	17.33
One week	6	8.00
One month	1	1.33
Three months	11	14.67
Five months	44	58.67
Total	75	100.00

Source: (Author, 2014)

Figure 1: Bar graph on client opinion on service delay

Results suggest that the current non-computerized approach used by the Pharmacy Council to deliver service to pharmacy operators is time consuming. This latency of up to five months may be reduced by the use of effective information systems. Source: (Author, 2014)

Age as a Determinant of Opinions of Pharmacy Operators about Computerization at the Pharmacy Council

Responses from pharmacy operators on the computerization and service quality improvement at the Pharmacy Council were paired with their ages (Table 5). This was to determine the association between the age of the respondent and response on whether computerization can improve the quality of service at the Pharmacy Council. The strength of the association was also subjected to a chi-square test. A p-value of 8.44 for the observation (Table 5) indicates that the association is generally not significant.

Table 5: A cross-tabulation on the influence of age on clients' perception about the effects of computerization on the service quality of the Pharmacy Council?

Age Grouping	Can computerization improve service quality of the Pharmacy council?			Total
	I don't know	Yes		
20-29	1 9.09	20 16.26		21 15.67
30-39	3 27.27	38 30.89		41 30.60
40-49	1 9.09	39 31.71		40 29.85
50-59	3 27.27	18 14.63		21 15.67
60 and above	3 27.27	8 6.50		11 8.21
Total	11 100.00	123 100.00		134 100.00

Pearson's chi square

P-value = 8.44

A Univariate logistic regression model on the influence of age on clients' perception about the effects of computerization on the service quality of the Pharmacy Council is presented. Following the Odds Ratio, for each operator within the 20-29 age grouping that approved computerization as a quality improvement approach for the Pharmacy Council, there is likely to be 1.95 more operators within the 40-49 age grouping that would approve computerization but 0.13 more operators aged 60 and above who would approve computerization. None of the p-values for each age grouping however is below 0.05. Source: (Author, 2014)

Table 6: Univariate logistic regression model on the influence of age on clients' perception about the effects of computerization on the service quality of the Pharmacy Council

Age Groupings	Odds Ratio	P-value	[95% Conf.Interval]
20-29	1		
30-39	0.63	0.70	0.06 – 6.49
40-49	1.95	0.64	0.12 – 32.83
50-59	0.30	0.32	0.03 – 3.14
60 and above	0.13	0.10	0.01 – 1.48

Source: (Author, 2014) Results of the p-values from the regression model in Table 6 suggest that none of the age grouping had a significant relation with responses on whether computerization can improve service quality at the Pharmacy Council.

Experience with Computers as a Determinant of Opinions of Pharmacy Operators about Computerization at the Pharmacy Council

Responses from pharmacy operators on the computerization and service quality improvement at the Pharmacy Council were paired with their experience with the use of computers (Table 7). This was to determine the association between the respondent's exposure to computer usage and response on whether computerization can improve the quality of service at the pharmacy council. The strength of the association was also subjected to a chi-square test. A p-value of 6.95 for the observation (Table 7) indicates that the association is generally not significant.

Computerized Pharmacies and Opinion of Operators about Computerization at the Pharmacy Council

Responses from pharmacy operators were analysed to determine the association between the respondent's computerized state of pharmacy operated and response on whether computerization can improve the quality of service at the Pharmacy Council. The strength of the association was also subjected to a chi-square test. Generally, there is a significant level of association between pharmacy operators who have computerized

pharmacies and the perception of the pharmacy operators about whether computerization can improve the quality of service of the Pharmacy Council.

Table 7: Analysis on the influence of clients' level of experience in the use of computers on perception about the effects of computerization on the service quality of the Pharmacy Council?

Experience with the use of computers	Can computerization improve service quality of the Pharmacy Council?		
	I don't know	Yes	Total
High	6 54.55	84 68.85	90 67.67
Average	3 27.27	35 28.69	38 28.57
None	2 18.18	3 2.46	5 3.76
Total	11 100.00	122 100.00	133 100.0

Pearson's chi square

P-value = 6.95

A Univariate logistic regression model on the influence of clients' level of experience in the use of computers on perception about the effects of computerization on the service quality of the Pharmacy Council is presented. Following the Odds Ratio, for each operator with high computer experience and approved computerization as a quality improvement approach for the Pharmacy Council, there is likely to be 0.83 more operators with average computer experience that would approve computerization and 0.11 more operators with no computer experience that would approve computerization. The p-values for operators with no computer experience (0.03) is below 0.05. Source: (Author, 2014)

Table 8: Univariate logistic regression model for level of experience in computers opinion about computerization on the service quality of the pharmacy council

Experience with the use of computers	Odds Ratio	P-value	[95% Conf.Interval]
High	1		
Average	0.83	0.8	0.20 – 3.52
None	0.11	0.03	0.02 – 0.77

Results of the p-values from the regression model; however indicates a significant association between those who had never used a computer before and their response on whether computerization can improve service quality at the Pharmacy Council. This relation may explain why some of the pharmacy operators disagree to the computerization of the processes/services of the Pharmacy Council. Source: (Author, 2014)

Table 9: Analysis on operators with computerized pharmacies and their perception about computerization on the service quality of the Pharmacy Council

Computerized Pharmacy	Can computerization improve service quality of the Pharmacy Council?		
	I don't know	Yes	Total
Yes	6 54.55	69 57.50	75 57.25
No	5 45.45	51 42.50	56 42.75
Total	11 100.00	120 100.00	131 100.00

Pearson's chi square

P-value = 0.04

Following the univariate logistic model presented giving the Odds Ratio, for each operator with a computerized pharmacy and approved computerization as a quality improvement approach for the Pharmacy Council, there is likely to be 0.89 more operators without computerized pharmacies that approve computerization of services at the Pharmacy Council. The p-value for operators without computerized pharmacy (0.9) is above 0.05. Source: (Author, 2014)

Table 10: Univariate logistic regression model for operators with computerized pharmacies computerization on the service quality of the pharmacy council

Has Computerized Pharmacy	Odds Ratio	P-value	[95% Conf.Interval]
Yes	1		
No	0.89	0.9	0.26 – 3.07

Following results from previous tables pharmacy operators that have integrated computers with their business tend to appreciate the value of computerization better than those who have not computerized their businesses. Source: (Author, 2014)

Concerns in Computerizing the Services/Processes at the Pharmacy Council

Responses to issues that may pose challenges to computerizing services or processes at the Pharmacy Council were received. These challenges were responses from Pharmacy Council staff. In total twenty-seven (27) responses were received. Response are grouped into four major issues; cost implications on computerization; the availability of computers and expertise to manage and maintain the system; concerns that some cumbersome services/processes cannot be computerized; and the lack of commitment from management to computerization. Presented in Table 11 is summary statistics on the four major challenges realized from responses received.

Table 11: Major challenges that may affect the computerization of Pharmacy Council to improve service quality

Major Challenges to Computerization	Frequency	Percentage	Total
cost implications on computerization	10	37.04%	27
the availability of computers and expertise	13	48.15%	27
services/processes cannot be computerized	3	11.11%	27
the lack of commitment from management	9	33.33%	27

The availability of computers and expertise to maintain the system were the main concerns of the staff. The cost of equipment and employing new personnel to manage and maintain the system was also the major issues identified in the responses received. Additionally, other responses indicated the possible cost and process of training staffs as a major challenge. Thirdly, the lack of commitment from top management to computerize services was also indicated in the responses. Some staff explained that computerization was not top priority on budget and management plans. Source: (Author, 2014)

Other staff attributed this lack of commitment to the low level of knowledge among top management in using computers. Other staff also attributed the lack of commitment to government regulations and the centralized nature of processes at the Pharmacy Council. Other staff explained the difficulty in computerizing certain services and decision processes that delay service delivery. Such processes require physical presence and discretionary decisions.

CONCLUSION

To conclude, the general objective of the study was to assess the role of information systems in enhancing the performance of the Pharmacy Council in its activities. The study was conducted at the Pharmacy Council, in addition to one hundred and thirty-six (136) Pharmacies in the Ashanti Region. The demographic and business characteristics of the pharmacy operators studied were determined and information was tapped from responses from both Pharmacy Council staff and pharmacy operators to achieve specific objectives set out for the study. A very large percentage of pharmacy operators had obtained tertiary education. This pattern was expected due to the nature of work and level of knowledge/expertise required to successfully operate a pharmacy business. Results from the statistics indicate that a high number of both the staff and pharmacy operators strongly agreed with computerization of the listed operations of the Pharmacy Council. There were relatively high approval from both the staff and pharmacy operators to computerize services for license renewal; the most commonly recurring service compared with the others. From this indication, IS presents a great potential for the Pharmacy Council to reengineer its processes to meet the current global trends and improve on its service delivery. There is no

significant association between the age of the pharmacy operators and their perception of the value of computerization to improve the quality of service of the Pharmacy Council. However, responses from pharmacy operators that have experience with the use of computers and those that have computerized pharmacy have significant associations with their perceptions about whether computerization can improve the quality of services of the Pharmacy Council.

WORK HABITS AS POSITIVE AND NEGATIVE INFLUENCE ON WORKPLACE PRODUCTIVITY

Jon K. Webber, University of Phoenix
Elliot M. Ser, Florida Atlantic University
Gregory W. Goussak, Ashford University

ABSTRACT

The purpose of this study was to measure senior level executive perception of what encompasses successful workplace productivity in 21st century organizations. This qualitative study involved 42 senior level executives from 14 different industries and institutional groupings who represented Western organizations. Over 76% of the participants had over 10 years' experience in their professional field. These senior level executives indicated that a number of different categories such as Attitude, Ethics, Initiative, Interpersonal Skills, Personal Development, Teams, Leadership, Time management, Focus, Rules and Solutions were either positive or negative workplace habits affecting productivity. The majority of executives cited Attitude as the most positive workplace habit affecting productivity and Lack of Accountability and Carelessness as the most negative workplace habits affecting productivity. The authors' findings offer insights into ways that senior leaders can adjust their hiring and training strategies so positive workplace habits are enabled and negative ones are contained and minimized so greater productivity can be engaged in the workplace. We offer directions for future research in the subject area and point to areas for possible training consideration.

JEL: A10, M10, M12

KEYWORDS: Workplace Productivity; Workplace Habits; Strategic HRM

INTRODUCTION

Measuring work place productivity is a difficult process to quantify. What does it mean to have a productive workplace? Is productivity measured strictly by financial results or do other characteristics play a role in the final definition ascribed by organizational leaders? The characterization of the 21st century as the information age has brought with it an unquestionable number of challenges for businesses. These challenges range from ethical considerations to technological advances to methods of communicating a message to a global community forcing companies to evaluate business strategies and focus. Each of these concepts is a component of what becomes overall organizational productivity. According to Plunkett, Allen and Attner (2013), "productivity is the relationship between the amount of input needed to produce a given amount of output and the output itself" (p. 136). Understanding what defines specific inputs and outputs will differ from organization to organization. Kempplila and Lonnqvist (2003) believe productivity is the key measure of success. This study is focused on the key concepts that senior level leaders believe encompass successful workplace productivity in 21st century organizations. Primarily, this study sought to understand the specific work habits expected by senior level management to create positive workplace productivity. In contrast, understanding what behaviors and work habits create negative productivity was also important.

LITERATURE REVIEW

Previous studies were in agreement that there are positive and negative connotations associated with an employee's workplace performance. de Waal (2012) identified 35 characteristics that are correlated with high performance in an organization. de Waal's study grouped these qualities into five factors, which

effectively developed a descriptive framework model of a high performance organization (HPO). de Waal defined a HPO as one that “achieves financial and non-financial results that are exceedingly better than those of its peer group over a period of time of five years or more” (pp. 46-47). de Waal’s five factors included: Continuous Improvement and Renewal, Openness and Action Orientation, Management Quality, Workforce Quality, and Long Term Orientation. The Long Term Orientation factor had the strongest correlation with competitive performance. A sixth factor, Autonomy, did not show any correlation with relative performance and only a weak correlation with historical performance, and was eliminated as a relevant factor. Additionally, in an examination of the impact of organizational culture on employee performance and productivity, Uddin, Luva, and Hossian (2013) conducted a qualitative study in the telecommunications industry in Bangladesh and concluded that organizational culture significantly influenced employee performance and productivity.

Meanwhile, a few years earlier, Rapert and Wren (1998) incorporated both a structural framework and processes of communication theory when they concluded that both are determining factors between what is considered a high or a low performing organization. One other consideration involved the changing nature of technological improvements in the workplace and how there may be generational differences in how workers are able to adjust to organizational demands. According to de Koning and Gelderblom (2006) the relationship of information and communications technology (ICT) use among older workers influences job performance. de Koning and Gelderblom concluded that older workers make less use of ICT and have more difficulties with complicated applications than younger workers. The diminished use of ICT was seen as a disadvantage for older workers, as the increased application of ICT in today’s workplace is recognized as a positive impact on performance.

Meanwhile, Posthuma, Campion, Masimova, and Campion (2013) recognized there is a lack of consensus in the literature related to the structure of high performance work systems (HPWS). Posthuma et al developed a taxonomy to address what they determined to be a potential barrier to growth in the literature on HPWS, as well as limited knowledge that potentially resulted in diminished application of HPWS in organizations. Posthuma et al reviewed 193 peer-reviewed articles published between 1992 and 2011, categorizing 61 practices into nine categories to draw those conclusions: 1) compensation and benefits; 2) job and work design; 3) training and development; 4) recruiting and selection; 5) employee relations; 6) communication; 7) performance management and appraisal; 8) promotions; and, 9) turnover, retention, and exit management (pp. 1193-1199).

Jensen, Patel and Messersmith (2013) explored the influence of high-performance work systems (HPWS) with traditional human resources variables of job control, employee anxiety, role overload and turnover. Jensen et al surveyed nearly 1600 government workers in Wales, concluding that the negative consequences of HPWS could be ameliorated with appropriate levels of job control and employee autonomy in the implementation of job responsibilities. HPWS typically address human resources management practices that address recruitment and selection, compensation, and training, with the expectation of the organization realizing a strategic competitive advantage as a result of improved efficiencies in performance, productivity, and employee turnover. Furthermore, Langfred (2013) investigated the underlying reason of what motivates people to seek autonomy at work. Langfred’s research focused on two perspectives: 1) people desire autonomy to be more satisfied in their job, and 2) people desire autonomy to be more productive in their job. The Langfred study concluded that workers who believe that more autonomy would lead to greater satisfaction were more likely to seek increased autonomy than those seeking autonomy only for potential rewards. Dever and Morrison (2009) studied the positive workplace conditions that were highly conducive for productivity among women researchers. Among the factors leading to higher productivity were varieties of personal factors as well as the workplace culture. Complementing the traditionally recognized factors of personal motivation and individual practice were the institutional support structure of organization culture, work-life balance and workplace dynamics. Utilizing research survey data conducted in British workplaces, Brown, McHardy, McNabb and Taylor (2011) focused on the influence of worker commitment and loyalty

on workplace performance. Brown et al concluded that through HR practices, management could increase commitment and loyalty among employees, resulting in improvement of workplace performance. External factors also have an effect on performance as evidenced by Forde, Slater and Spencer (2006), who revisited a 1998 British workplace employee relations study examining the relationship between threat of job loss and participation on productivity. Forde et al found the threat of job loss on productivity was relatively insignificant compared with the highly positive influence occurring when workers fully participate in their work and productivity is increased. Concurrently, Linz (2003) analyzed job satisfaction of Russian workers, utilizing studies of U.S. workers showing positive correlation with labor productivity and negative correlation with labor turnover, and concluding both had an influence on the organization's performance. Both of these correlated factors, worker characteristics (e.g., work experience and supervisory responsibilities) and subjective characteristics (e.g., attitude toward work), appeared to influence the firm's performance. The Linz study did not attempt to assign causality of the factors on job satisfaction, but did evaluate factors that increased probability of perceived high level of job satisfaction.

Charness and Kuhn (2007) found that worker attitudes directly affected behavior and thus overall productivity. The impact of worker attitudes comparing their own wages to coworkers' wages was found to be a non-factor in affecting workers' efforts. Charness and Kuhn concluded that workers' efforts were related to their own wages, raising a question about the validity of equity concerns in relation to pay policy (wage compression and wage secrecy). Doucouliagos (1995) applied meta-analysis techniques to investigate effects of worker participation on productivity. Doucouliagos addressed two perspectives related to participation: supporters' arguments for improved worker commitment, and increased work effort resulting in efficiency and productivity; detractors' arguments that participation reduces managerial power waste of resources and other human resource problems. Doucouliagos (1995) arrived at several conclusions: participation did not hinder productivity; democratic governance in labor-managed firms is not negatively correlated with productivity; labor-managed firms' (LMFs) profit-sharing is more positively related to productivity than worker participation in decision making; profit-sharing did not appear to be more important than participation in participatory capitalist firms (PCFs). This opposing view of the effect of profit-sharing was explained by Doucouliagos describing workers in LMFs as worker-entrepreneurs, more interested in profit and the firm's survival. Workers in PCFs, however, were described as hired labor, more interested in issues affecting them as workers, rather than in furthering the owner's interests.

Additionally, Heywood and Jirjahn (2004) explored the costs of absenteeism as it relates to productivity. The researchers hypothesized that interdependent worker productivity firms have higher costs of absence, and therefore spend additional resources on monitoring absences as compared with team production firms that experience lower costs for absenteeism. Heywood and Jirjahn determined that firms with a team approach have lower absence rates, which would then increase worker productivity and lower the organization's overhead costs. Mas and Moretti's (2009) study on peer pressure's effects in the workplace noted positive productivity outcomes from infusing highly productive personnel into a work group. Mas and Moretti concluded that positive productivity was the outcome of workers who interacted with highly functional team members. Meanwhile, those workers who did not have direct engagements with such engaged people did not experience the same level of productivity in their organizational setting.

Similarly, Abel (2013) explored the relationship between increasing employee satisfaction and lower labor costs. Recognizing a need to increase organizational efficiencies, Abel researched employer-employee relationships, and concluded that more satisfied employees likely provide organizations with human resources to address environmental challenges effecting increased profitability. There is also a connection to a study by Singh (2013), who explored the correlation between leader emotionally intelligent behaviors (EIBs) and the job satisfaction of their employees. Singh found that there is a significant correlation between employee job satisfaction and leaders' interpersonal and intrapersonal EIBs. The study concluded that a leader's EIBs are essentially intrinsic motivational factors that influence employees to perform at optimum levels due to job satisfaction. On the other hand, Singh concluded that dissatisfied employees are less

influenced by the leader's EIBs and thus perform at less than desired optimal levels in the organization. Thus, there are opportunities and challenges for leaders who either have a positive or negative influence on their organization's operations and desire to effect a change toward greater productivity.

METHODOLOGY

Design: This study utilized a qualitative, exploratory case study research design to consider how senior leaders identify and categorize positive and negative workplace habits involving current employees. This approach was performed in order to probe if there are approaches for organizational leaders to use when attempting to increase positive productivity levels and reduce negative behavior that causes productivity to decrease and morale to be lowered in the process. Gaining insights from this method was seen as appropriate because its purpose was to provide senior leadership with understanding on ways to proactively engage future and current employees and connect them to the organization's cultural expectations. The results provide significant value in considering human capital need decisions in pre-employment and for training considerations for established workers.

Population and Sampling Procedure: Forty-two senior level leaders, coded RS1-RS42 to protect their identity, from 14 industries and institutional groupings were chosen to participate in the study from a population of several hundred professional and social media connections of the researchers. Other invited connections did not respond to repeated requests from the researchers to provide their insights into the subject matter. Gender, age, and education were not considered significant areas of delineation for the current study. Tables 1 and 2 illustrate the participants' demographic background in terms of years of experience and areas of expertise makeup. In the open-ended online survey, the sampled participants were asked to describe their perspectives on work habits that may have a positive or negative influence on their organization's operations.

Table 1: Subjects' Years of Experience

Years in Work Area	n
1-10	10
11-20	12
21-30	13
31-40	5
41-50	2

This table shows the participants' demographic background in terms of years of experience. N=42 participants in the study.

Table 2: Subjects' Work Fields

Area of Expertise	n
Education and Training	9
Military and Government	7
Service	5
Consulting	4
Manufacturing	4
IT/Software	3
Communications	2
Food and Beverage	2
Marketing	1
Medical	1
Nuclear	1
Real Estate	1
Security	1
Transportation	1

This table shows the participants' areas of expertise makeup. N=42 participants in the study.

Recruitment and Selection Criteria: The study was limited by the number of executives who agreed to visit the survey web site and complete both the demographic and survey questions. Participants were invited to give their opinion on workplace habits from the fields of education and learning; government and legal; manufacturing; consulting; service; communications; information technology; security; food and beverage; marketing; transportation; medical; nuclear engineering; and real estate. Prior to having access to the actual survey questions, participants were required to sign an informed consent document that explained participant rights and provides an assurance of strict confidentiality with any published documents relating to this study. Those participants who did not follow instructions were not allowed by the system to move on to the main survey pages. Participants who just filled in letters or numbers to defeat the system were not included in the survey tabulation. Approximately ten potential participants were excluded from the study for that reason.

Interview Questions: What does your organization consider to be the most important work habits that an employee should follow, which could lead to positive workplace productivity?
What does your organization consider to be the most detrimental work habits that an employee should avoid, which could lead to negative workplace productivity?

Data Collection: An online survey method was used in the research process through SurveyMonkey™. This method allowed participants to use as much time as required to answer two open ended survey questions at their leisure, but all responses were required to be entered during that session. Information was not tabulated by SurveyMonkey™ until the subject clicked on the submit button once their work was completed. Prior to the beginning of the survey session, potential subjects were informed of the purpose, benefits, measures to protect their identity, possible risks, and where to seek assistance if questions or concerns arose from their involvement in the study.

Instrumentation: This study used semi-structured interview questions to gather participants' perceptions of both positive and negative workplace habits. Two open-ended questions were used to guide the study in determining what senior level leaders believe are work attributes that are either beneficial or detrimental to organizational productivity. Each question was categorized under two research topics. Survey question #1 was used to gather details on what senior leaders see as the most important work habits that an employee should follow to maintain and increase workplace productivity. Survey question #2 was used to gather details regarding what senior leaders in an organization view as the most detrimental work habits that an employee should avoid because such practices lower workplace productivity in an organization.

Data Analysis: This study involved a qualitative method study with a collective case study research design. Axial coding was utilized to evaluate the data closer and to specifically identify categories and clusters of information where the senior leaders might be in general agreement. Selective coding was also used to identify the major themes, constructs, and concepts of the study. The coding process reviewed emerging themes that were naturally categorized around the raw data that came from the received qualitative data.

RESULTS AND FINDINGS

The narrative data were analyzed, and themes and patterns emerged pertaining to the viewpoints of senior leaders and their perspectives on positive and negative workplace habits. The 42 senior level leaders in this study identified 11 general categories where on the research questions seemed to cluster. Participants indicated that workplace habits were aligned in the areas of attitude; rules; ethics; focus; development; initiative; interpersonal skills; solutions; time management; leadership; and teams. The number of subjects who commented on attitude issues in the workplace were at the top of the list in both the positive and negative habit inquiries. Ethics and Interpersonal Skills also shared in the top five categories in both listings, though not in the exact same position. Focus, Initiative, Personal Development, and Time Management also appeared in one of the top positive or negative categories of the study. Table 3 provides a side by side

comparison of where all 11 categories ranked when all areas were categorized from the data collected and analyzed.

Table 3: Workplace Attitude Category Rankings

Positive Workplace Habits		Negative Workplace Habits	
Attitude	43%	Attitude	45%
Ethics	33%	Interpersonal Skills	29%
Initiative	26%	Time Management	26%
Interpersonal Skills	24%	Focus	24%
Personal Development	21%	Ethics	21%
Teams	17%	Initiative	17%
Leadership	14%	Rules	14%
Time Management	14%	Leadership	10%
Focus	12%	Personal Development	10%
Rules	12%	Solutions	10%
Solutions	7%	Team	5%

This table shows a side by side comparison of where all 11 categories ranked when all areas were categorized from the data collected and analyzed.

The top five issues in both positive and negative work habits that emerged from the data is presented. Attitude, Ethics, Focus, Initiative, Interpersonal Skills, Personal Development, and Time Management will be examined from the perspectives of the 42 senior level leaders who participated in this study.

Attitude

This category was the one noted by participants as both the top positive and negative workplace habit an employee can possess. Eighteen participants (43%) gave comments involving attitude related issues as a positive influence in the workplace while 19 participants (45%) provided input involving such practices being a negative influence in the organization. Table 4 shows specific comments from subjects on both sides of the attitude issue.

Table 4: Workplace Attitude Characteristics

Positive Workplace Habits		Negative Workplace Habits	
Accountable	Positive Attitude	Absenteeism	Negative talk
Adaptable	Pride in work	Arrogance	Not committed
Attention to details	Professional	Backstabbing	Questions authority
Cooperation w/Peers	Quality	Careless	Reactive
Curiosity	Respectful	Complaining	Rude
Enthusiasm	Sense of humor	Disrespect	Selfish
Hard work	Servant Leadership	Disrespectful	Unaccountable
Initiative	Willing to learn	Finger pointing	Uncooperative
Open to ideas	Work-life balance	Inconsistency	Undependable
		Indifference	Unmotivated
		Lone wolf	Unwilling to change
		Low respect	

This table shows specific comments from subjects on both sides of the attitude issue.

Ethics

Fourteen participants (33%) gave comments involving ethics related issues as a positive influence in the workplace while nine participants (21%) provided input involving such practices being a negative influence in the organization. Table 5 shows specific comments from subjects on both sides of the ethics issue.

Table 5: Workplace Ethics Characteristics

Positive Workplace Habits	Negative Workplace Habits
Environmental awareness	Bad mouth clients
Ethics	Corruption
Honesty	Inappropriate behavior
Integrity	Inappropriate language
Moral Courage	Lying
Work ethics	Misrepresenting facts

This table shows specific comments from subjects on both sides of the ethics issue.

Focus

Five participants (12%) gave comments involving focus related issues as a positive influence in the workplace while ten participants (24%) provided input involving such practices being a negative influence in the organization. Table 6 shows specific comments from subjects on both sides of the focus issue.

Table 6: Workplace Focus Characteristics

Positive Workplace Habits	Negative Workplace Habits
Attention to details	Divisive
Big Picture	Email wars
Dedication	Missed deadlines
Focus on customer	Not able to multi-task
Globally competitive	Personal problems
Right mind set	Repeated mistakes
	Unfocused work

This table shows specific comments from subjects on both sides of the focus issue.

Initiative

Eleven participants (26%) gave comments involving initiative related issues as a positive influence in the workplace while seven participants (17%) provided input involving such practices being a negative influence in the organization. Table 7 shows specific comments from subjects on both sides of the initiative issue.

Table 7: Workplace Initiative Characteristics

Positive Workplace Habits		Negative Workplace Habits
Commitment	Follow up	Accept poor quality
Customer Served	Initiative	Lack of follow up
Dependable	Intellectual curiosity	Lack of preparation
Diligent	Owens up to mistakes	Reactive in approach
End result in mind	Takes ownership	Unfocused work
Follow through		Unmotivated
		Unwilling to change

This table shows specific comments from subjects on both sides of the initiative issue.

Interpersonal Skills

Ten participants (24%) gave comments involving interpersonal skills related issues as a positive influence in the workplace while 12 participants (29%) provided input involving such practices being a negative influence in the organization. Table 8 shows specific comments from subjects on both sides of the interpersonal skills issue.

Table 8: Workplace Interpersonal Skills Characteristics

Positive Workplace Habits		Negative Workplace Habits	
Be wrong	Preparation	Arrogance	Inconsistency
Consistent	Prioritize	Disrespect	Lack of quality
Creativity	Quality	Ego centered	Not prepared
Detailed	Resourceful	Gossiper	Not value others
Help others	Responsibility	Ignore people	Poor people skills
Networks with others	Thoughtful	Inconsiderate	Unpredictable

This table shows specific comments from subjects on both sides of the interpersonal skills issue.

Personal Development

Nine participants (21%) gave comments involving personal development related issues as a positive influence in the workplace while four participants (10%) provided input involving such practices being a negative influence in the organization. Table 9 shows specific comments from subjects on both sides of the personal development issue.

Table 9: Workplace Personal Development Characteristics

Positive Workplace Habits		Negative Workplace Habits	
Coach others	Learnability	Inability to grow	
Continuous development	Networking	Lack of follow up	
Innovation	Persistent	Lack of suggestions	
Learn software used	Willing to learn	Miscommunication	

This table shows specific comments from subjects on both sides of the personal development issue.

Time Management

Six participants (14%) gave comments involving time management related issues as a positive influence in the workplace while 11 participants (26%) provided input involving such practices being a negative influence in the organization. Table 10 shows specific comments from subjects on both sides of the time management issue.

Table 10: Workplace Attitude Characteristics

Positive Workplace Habits		Negative Workplace Habits	
Being on time	Time allocation	Lack of time commit	Tardiness
Punctuality	Timely delivery	Not timely	Time commitment
Scheduling	Work until done	Procrastination	Unable to complete work

This table shows specific comments from subjects on both sides of the time management issue.

CONCLUSION

The diverse nature of the 42 business leader participants of this study encompassed a wide range of expertise and professions from both public sector and private sector organizations. The focus of this study was not on a specific measure of productivity but on expected behaviors of performance covering both positive and negative workplace habits. According to an overwhelming majority of cited opinions from previous studies on workplace productivity, attitude focused on such positive components as accountability, adaptability and professional behavior and negative components of disrespect, lack of accountability and carelessness are the hallmarks of where future workplace productivity studies should be focused.

The direct correlation of either positive or negative workplace habits to workplace productivity in previous studies were based on intangible behaviors that are not easily quantified but are familiar to experienced leadership. In our current study, the top five issues in both positive and negative work habits that emerged

from the data were Attitude, Ethics, Focus, Initiative, Interpersonal Skills, Personal Development, and Time Management. However, when separated into their distinct categories, the behaviors noted by participants for positive workplace productivity included: (a) Ethics, (b) Initiative, (c) Interpersonal Skills, and (d) Personal Development. Senior leaders also noted that negative behaviors affecting workplace productivity included: (a) Lack of Interpersonal Skills, (b) Inability to Manage One's Time, and (c) Lack of Individual Focus. What we discovered in our research were similar areas of concern raised in previous studies that still require managerial attention and oversight because while their attributes are identifiable, there is a gap in understanding how to minimize negative traits and maintain or increase positive habits in the workplace.

Insights from senior level executives from both public and private sector organizations formed the basis of this study. We suggest now that separate studies be undertaken to focus on the specific segment's unique challenges in dealing with employees. Future research should advance the findings of the current study by investigating the effects such traits actually have on workplace productivity. While it is important to enumerate the positive and negative habits present in the workplace, there is still an overarching question to be considered: How do such identified workplace habits actually impact organizational processes in a positive or negative way? Insights from this new line of inquiry could assist executives in better determining what is needed in human resource development planning in areas such as pre-screening potential candidates, working with new employees in their probationary phase, and developing yearly employee performance planning goals for more seasoned employees.

AN EMPIRICAL ANALYSIS OF FINANCIAL PERFORMANCE OF MICRO, SMALL, AND MEDIUM ENTERPRISES IN THE PHILIPPINES

Rufo R. Mendoza, Asian Institute of Management

ABSTRACT

The study analyzed the financial performance of selected micro, small, and medium enterprises using secondary data from their financial statements for the past three years. Results showed the enterprises performed favorably in liquidity, activity, and leverage but suffered from a low-level profitability. Using correlation, the study found out there is a significant linear relationship between liquidity and activity, liquidity and leverage, and activity and leverage. However, each of these measures has no significant relationship with profitability. Using t-test, the study also found out there is no significant difference in the liquidity, profitability, and inventory turnover of the enterprises when grouped according to organizational form, business type, and asset size. However, a significant difference exists in the receivable turnover, asset turnover, and debt ratios. The study recommends the MSMEs should revisit their strategies on improving profitability and use financial performance information in coming up with vital and critical decisions. Also, they should connect financial performance to the larger external environment of the business so they will continue to play an important role in the growth of the economy.

JEL: M00; M400

KEYWORDS: Financial Performance, Organizational Form, Business Type, Asset Size

INTRODUCTION

This study assessed the financial performance of selected micro, small, and medium enterprises (MSMEs) in liquidity, activity, leverage, and profitability and explored the relationship among these measures. It also tested if there is a significant difference in the financial performance of the MSMEs grouped according to three categories: organizational form, business type, and asset size. This study contributes to existing literature in several ways. First, it provides an empirical evidence on the financial performance of MSMEs whose capacity and needs are different from the large enterprises, multinational corporations, and publicly listed companies. The study found out MSMEs had satisfactory performance in liquidity, activity, and leverage but experienced low profitability. As a result, MSMEs need strategic actions and directions that focus on improving profitability.

Second, the study provides an empirical basis to infer that significant linear relationship exists between liquidity and activity, liquidity and leverage, and activity and leverage. However, these three measures of financial performance (liquidity, activity, and leverage) did not show any significant relationship with profitability. This finding contradicts several previous studies. For instance, Ayodele & Oke (2013, p.52) found out there is a direct correlation between the liquidity and profitability of banks when they studied how 24 commercial banks in Nigeria performed. In the same way, Bolek & Wilinski (2012, p. 51) concluded that financial liquidity influences profitability of construction companies listed in the Warsaw Stock Exchange from 2000 to 2010. Kaya (2014, p. 66) found out that firm leverage is an important factor in explaining profitability and liquidity of both retailers and wholesalers in the U.S. Meanwhile, in Pakistan, Akhtar et al. (2012, p. 15) have proven that a positive relationship prevails between financial leverage and financial performance. Such finding includes profitability measures such as return on sales, return on assets, return on equity, earnings per share, and dividend ratios. This was the result of their investigation of 20

publicly listed limited companies from the fuel and energy sector at Karachi Stock Exchange. Nonetheless, the results of this study agree with Niresh (2012, p. 39) who revealed there is no significant relationship between liquidity and profitability when he analyzed 31 listed manufacturing firms in Sri Lanka during 2007 to 2011.

Third, the study provided evidence on the differences of financial performance of MSMEs when grouped according to organizational form, business type, and asset size. Such grouping is an area that researchers seldom explore. This research found out there is no significant difference in the liquidity, profitability, and inventory turnover of the enterprises when grouped according to these three categories. However, a significant difference exists in the receivable turnover, asset turnover, and debt ratios. Specifically, single proprietorships have significantly higher receivable turnovers than corporations and small enterprises have significantly higher receivable turnovers than both the micro and medium enterprises. Comparatively, both manufacturing and trading businesses have significantly higher asset turnover than those rendering services while small enterprises have significantly higher asset turnover than both the micro and medium enterprises. Corporations have significantly higher debt ratio compared with sole proprietorships; manufacturing business, compared with trading; and medium enterprises, compared with both micro and small enterprises.

Finally, the study provided the MSMEs some bases to benchmark their performance. In doing so, they will be able to maximize value and better contribute to the social and economic well-being of a country. Studies focused on the characteristics of entrepreneurs (Morales et al., 2013) and dynamics of the entrepreneurial processes (Baltar & Coulon, 2014) are best combined with financial performance benchmarks to achieve greater entrepreneurial results. Since MSMEs are recognized as an important vehicle for the economic growth of most nations, mainstreaming their financial management concerns is paramount in any economy. The succeeding part of this paper contains the related literature, data and methodology, results of the empirical investigation, and conclusions.

LITERATURE REVIEW

Researchers have written much about the financial concerns of MSMEs. Typically, previous studies focused more on the critical reasons that prevented MSMEs to use available financial packages. The Philippine Senate (2012) identified access to finance as the most serious constraints to MSME growth and development. Aldaba (2012) underscored that SMEs had been unable to access funds because of their limited track record, limited acceptable collateral, and inadequate financial statements and business plans. Banks turn down financial requests of SMEs because of poor credit history; insufficient collateral; inadequate sales, income or cash flow; unstable business type; and poor business plan.

By the same token, the ASEAN Strategic Action Plan for SME Development (2010–2015) identified access to finance as the primary goal, with other four dimensions: market and internationalization, human resource development, information and advisory services, and technology and innovation. This means that lack of access to finance makes it more crucial for MSMEs to manage funds efficiently and effectively. Indeed, Jasra et al. (2011) stressed that financial resources are the most important factors that affect the success of SMEs and on which the whole business depends. They cited that SMEs have to endure the problem on modest capital compared with the large multinational corporations. Piet (2010) proved most entrepreneurs need financial skills and motivational and entrepreneurial skills to develop their businesses. At the same time, Piet (2010) noted there is a need for support in financial management among MSMEs to improve their financial health. These findings point to the importance of managing the financial resources among these enterprises.

Still, MSMEs are facing the challenge of putting in place an effectively functioning system on managing a broad range of financial activities that would enable achieving business goals. Thus, it is important for the MSMEs to capture financial information and measure performance in the use of financial resources.

Mendoza (2014) cited that MSMEs need the services of practicing Certified Public Accountants in most of these financial management areas, specifically taxation, accounting and financial reporting, and audit. In addition, micro and small enterprises differ from medium enterprises in complexity of accountancy services. Micro enterprises have simpler ways of doing their tasks and are not vent into exploring the other complex methods and processes.

There is also a plethora of literature on financial performance of businesses. Previous researches tackled on two major themes: performance measurement approach and measures of performance. On the first theme, the goal approach of Chong (2008) became clear for MSMEs. In this approach, owners and managers set their target internally based on their interest and capacity of business to achieve. The approach enables owners and managers to find out if they achieve their goals by looking at both financial and nonfinancial measures. Thus, its simplicity makes it popular. Shahbaz et al. (2014) described the system resource approach as a way to measure the performance by appraising the capacity to get resources or inputs. They also explained the stakeholder approach as something related to meeting the needs and expectations of the entity's stakeholders. Chen & Huang (2013) used the organizational life cycle stages in analyzing the financial performance of audit firms in Taiwan. They found out that financial performance continues to increase as the firms grow, resulting in best performance at old stage. Dalrymple (2004) forwarded the benchmark index as another approach in measuring performance. In this approach, the financial measures fall under the category of resource management. In essence, the MSMEs have to take time to measure their financial performance and gauge it against standards or benchmarks.

On the measures of financial performance, Chong (2008) identified profit and asset turnover to assess short-term duration but steady revenue growth rate and growth in the employment size to measure long-term capacity. The Kennas Chartered Accountants (2014) considered profitability and return on assets as the key performance indicators that are critical in understanding the state of financial health of a business. The four commonly used measures are liquidity, activity, leverage, and profitability (Levy, 1998; Melicher & Norton, 2000; Statistics Canada, 2014). The Statistics Canada (2014) used solvency in lieu of liquidity and efficiency in lieu of activity. Melicher & Norton (2000) used asset management synonymously with activity and included market value for entities listed in the stock exchange.

DATA AND METHODOLOGY

The research used secondary data from 99 annual financial statements of 33 enterprises, all located in the CALABARZON Region in the Philippines. The enterprises used these financial statements in filing their annual income tax returns for the last three years (2011-2013). A great majority (60.61%) of the enterprises are single proprietorships, while the remaining 39.39 percent are corporations. More than half (51.52%) of the enterprises are into trading business and the rests are service (27.27%) and manufacturing (21.21%). When grouped according to asset size, 45.45 percent are micro, 27.27 percent are small, and 27.27 percent are medium enterprises. In assessing the performance of the entities, the qualitative rating scale in Table 1 was used.

Table 1: Qualitative Rating Scale

	Low	Medium	High
Liquidity			
Current ratio	Below 2	2 to 10	Over 10
Quick ratio	Below 1	1 to 5	Over 5
Activity			
Collection days	After the credit terms	Within the credit terms	Before the credit terms
Inventory days	Over 20	10 - 20	Below 10
Asset turnover	Below 5	5-10	Over 10
Leverage			
Debt ratio (%)	Above 60	40-60	Below 40
Profitability			
Return on sales (%)	Below 5	5-10	Over 10
Return on assets (%)	Below 5	5-10	Over 10
Return on equity (%)	Below 5	5-10	Over 10

This table shows the qualitative rating scale that was used in assessing the financial performance of the business enterprises, classified into low, medium, and high for each measure. The ideal current ratio of 2:1 and quick ratio of 1:1 was used as the equivalent of low performance; the credit term was used for collecting receivables. Other criteria were based on the experience of most enterprises.

The research also examined two types of hypothesis: (a) relationship between and among the four measures of financial performance using the respective indicators under each measure and (b) significant difference in the financial performance when the MSMEs are grouped according to their profile. Specifically, the study has the following null hypotheses (Ho):

Ho1(a): There is no significant relationship between the liquidity and activity of MSMEs in the Philippines.

Ho1(b): There is no significant relationship between the liquidity and leverage of MSMEs in the Philippines.

Ho1(c): There is no significant relationship between the liquidity and profitability of MSMEs in the Philippines.

Ho2(a): There is no significant relationship between the activity and leverage of MSMEs in the Philippines.

Ho2(b): There is no significant relationship between the activity and profitability of MSMEs in the Philippines.

Ho3: There is no significant relationship between the leverage and profitability of MSMEs in the Philippines.

Ho4: There is no significant difference in the financial performance of the MSMEs when they are grouped according to (a) organizational form, (b) business type, and (c) asset size.

Pearson Product Correlation Coefficient was computed to describe the strength of the linear relationship that exists between the levels of two performance measures. Meanwhile, the Spearman Rank Order Correlation Coefficient was used for sample sizes lesser than 30 which were found to be not normally distributed. Also, if a scatter diagram shows a nonlinear relationship, a transformation of one of the variables was performed, with such transformation depending upon the appearance of the scatter diagram. The t-test was used for the significance of the correlation. One-way analysis of variance using F ratio was performed to find out whether the financial performance differs among three or more independent groups of enterprises classified according to the type (trading, manufacturing and service), and size of business (micro, small and medium). It is concluded that at least one group has a significantly different performance whenever the probability value or significance associated with the computed F ratio is less than 0.05. A post hoc comparison test (Tukey HSD) was performed whenever statistically significant differences resulted from each one-way analysis of variance. This enabled the determination of which independent group got a significantly different performance.

RESULTS AND DISCUSSION

The results are presented in three parts: overall financial performance of the MSMEs, relationship of the financial performance measures, and test of differences when the MSMEs are grouped. The first finding of the study is the high score of MSMEs on liquidity and leverage, low score on profitability, and an erratic level in activity (Table 2).

Table 2: Overall Financial Performance

	2011	2012	2013	3-Year Mean	Qualitative Rating
Liquidity					
Current ratio	9.77	13.74	14.14	12.55	High
Quick ratio	6.38	10.08	11.13	9.20	High
Activity					
Receivable turnover	65.72	68.90	53.93	62.85	
Collection days	5	4	6	5	High
Inventory turnover	12.57	10.86	10.22	11.22	
Inventory days	24	28	29	27	Medium
Asset turnover	3.01	2.59	1.96	2.52	Low
Leverage					
Debt ratio	39.96	35.69	38.60	37.09	High
Profitability					
Return on sales	1.16	-11.95	-5.44	-5.41	Low
Return on assets	3.47	.34	1.12	1.64	Low
Return on equity	6.25	.47	.72	2.45	Low

This table shows all the measures and indicators used for assessing the financial performance for three years. Both indicators for liquidity had high ratings. The indicators for receivables had high scores also while those for inventories had medium rating. Debt ratio was high. Asset turnover and all the profitability indicators were low.

Both current ratio and quick ratio are far above the ideal measures—an indication that the MSMEs have the ability to meet short-term obligations as they mature. Melicher & Norton (2000, p. 461) opined that “a low current ratio may indicate that a company may face difficulty in paying its bills.” However, they cautioned that “a high value for the current ratio does not necessarily imply greater liquidity.” Nonetheless, a business has to remain liquid so as not to incur the cost associated with a deteriorating credit rating, a potential forced liquidation of assets, and possible bankruptcy (Moyer, McGuigan, & Kretlow, 1990, p. 587). Additionally, Van Horne (1992) concurred that the liquidity of the individual components of the current assets must be taken into account. Furthermore, a ratio lower than the ideals would be found acceptable in the more difficult liquidity conditions as cited by Samuels, Wilkes, & Brayshaw (1999, p.45). Bolek & Wilinski (2012, pp. 39-41) sent a deep-seated observation when they thought the use of current and quick ratios is a static measurement of liquidity. This is so because they rely on data included in the balance sheet. So, they proposed the use of measurement data that is dynamic, specifically those coming from the cash flow account, such as the cash conversion cycle.

The activity level was high in the collection of receivables, moderate in the inventory turnover, and low in the overall asset turnover. The fast collection of receivables was illustrated in the ability to collect even earlier than the usual credit terms of 15 days. Similarly, the debt ratio, an indication of how the businesses use borrowing as a source of fund, has been maintained below 40 percent each year. This could indicate safeguarding of the debt service payment at a satisfactory level and keeping borrowing at an acceptable level. Samuels, Wilkes, & Brayshaw (1999) opined that the acceptable level of inventory turnover should be linked to the type of industry or business. Likewise, they illustrated that the rule of thumb in the United Kingdom for an acceptable debt ratio is 50 percent or 1:2. Similarly, Melicher & Norton (2000) stated that asset turnover is significantly influenced by the characteristics of the industry within which the enterprise operates. They also underscored that the financial leverage ratio indicates the extent to which borrowed funds are used to finance assets.

Incidentally, the profitability level has been low based on all aspects: sales, assets, and equity, even resulting in negative profit percentage on sales. Studies conducted by Bejaoui & Bouzgarrou (2013) showed that capital is important in explaining profitability. The second finding of the study is that using correlation, several relationships exist between and among the different financial performance indicators (Table 3). First, liquidity and activity correlate as shown in the significant linear relationship between current ratio and inventory turnover ($r = .238$) as well as quick ratio and receivable ($r = -.267$) and inventory ($r = .372$) turnovers. There is a significant relationship between liquidity and leverage as shown in the coefficient between both the current ratio ($r = -.650$) and quick ratio ($r = -.670$) with debt ratio. However, there is no relationship between liquidity and profitability.

Table 3: Summary of Relationships of Financial Performance Measures

	RT	IT	AT	Debt Ratio	ROS	ROA	ROE
Current ratio	-.050	.238**	-.059	-.650*	.068	.170	.096
Quick ratio	-.267*	.372*	-.125	-.670*	.102	.163	.104
Receivable turnover (RT)				.027	-.216**	.071	.058
Inventory turnover (IT)				-.056	-.436*	-.188	-.206**
Asset turnover (AT)				.208*	-.567*	.045	.053
Debt ratio					-.236**	-.088	.144

*This table summarizes the correlation between liquidity (current ratio and quick ratio) and activity (receivable turnover, inventory turnover, and asset turnover). It also shows the correlation of activity and leverage (debt ratio). Finally, it shows leverage correlation with profitability (return on sales, return on assets, and return on equity). **correlation is significant at p-value less than 0.05; *correlation is significant at p-value less than 0.10*

Second, activity correlates with leverage as shown in the significant and positive relationship between asset turnover and debt ratio ($r = .208$). Also, activity correlates with profitability as the negative reciprocal of return on sales is also significantly but negatively related to all activity measures ($r = -.216, -.436, -.567$). The negative reciprocal of the return on equity significantly correlates with inventory turnover ($r = -.206$). Third, leverage correlates with profitability as shown in the linear relationship between debt ratio and return on sales ($r = .236$). In summary, the correlation has resulted in the varied decisions taken on the hypotheses (Table 4).

Table 4: Summary of Decisions on Hypotheses Tested

Hypothesis Number	Statement	Decision
Ho1(a)	There is no significant relationship between the liquidity and activity of MSMEs in the Philippines.	Reject
Ho1(b)	There is no significant relationship between the liquidity and leverage of MSMEs in the Philippines.	Reject
Ho1(c)	There is no relationship between the liquidity and profitability of MSMEs in the Philippines.	Accept
Ho2(a)	There is no relationship between the activity and leverage of MSMEs in the Philippines.	Reject
Ho2(b)	There is no relationship between the activity and profitability of MSMEs in the Philippines.	Accept
Ho3	There is no relationship between the leverage and profitability of MSMEs in the Philippines.	Accept

This table summarizes the decision about rejection or acceptance of the null hypotheses. The hypotheses that there is no significant relationship between liquidity and activity, liquidity and leverage, and activity and leverage were rejected. However, the hypotheses that there is no relationship between liquidity and profitability, activity and profitability, and leverage and profitability were accepted.

The third finding of the study is that using t-test of difference, there is a significant difference in some financial performance measures when the enterprises are grouped according to their business profile. Results of the t-test showed there is no significant difference in the liquidity of the MSMEs when grouped according to form of organization. This is so, because the probability values associated with the computed value of t for both ratios are greater than 0.05 (Table 5).

Table 5: Differences in Financial Performance of the Msme Grouped According to Organizational Form

		N	Mean	Std. Deviation	Computed Value Of T, Df	Significance
Liquidity						
Current Ratio	Corporation	39	14.465	39.526	.518,	p > 0.05
	Proprietorship	60	11.305	20.951	97	
Quick Ratio	Corporation	39	10.446	31.284	.401,	p > 0.05
	Proprietorship	60	8.387	19.806	97	
Activity

	Proprietorship	60	86.360	190.872	74.185	
Inventory turnover	Corporation	39	13.618	17.794	1.171,	p > 0.05
	Proprietorship	60	9.655	15.532	97	
Asset Turn-over	Corporation	39	2.444	2.544	-.179,	p > 0.05
	Proprietorship	60	2.567	3.751	97	
Leverage						
Debt Ratio	Corporation	39	60.624	32.364	5.949***,	p < 0.01
	Proprietorship	60	25.177	22.771	62.239	
Profitability						
Return on sales	Corporation	39	-.367	16.290	1.149,	p > 0.05
	Proprietorship	60	-8.686	52.356	75.301	
Return on assets	Corporation	39	1.800	2.608	0.077,	p > 0.05
	Proprietorship	60	1.541	26.028	60.814	
Return on equity	Corporation	39	1.821	12.912	-.255,	p > 0.05
	Proprietorship	60	2.908	28.824	88.026	

The table shows the results of the t-test on the differences of financial performance of the enterprises when they were grouped according to form of organization. Based on the test, there is no significant difference in the liquidity of the enterprises, but there exists a significant difference in the accounts receivable turnover. There are also no significant differences for inventory turnover and asset turnover but there exists a highly significant difference in the debt ratio. There is also no significant difference in profitability in terms of return on sales, return on assets, and return on equity. Notation *** means the difference is significant at $p < 0.01$ while ** means the difference is significant at $p < 0.05$.

On activity, it can be noted that when the enterprises are grouped according to form of organization, there exists a significant difference in the accounts receivable turnover of MSMEs ($t=-2.271$, $p<0.05$). Further, it can be inferred that the accounts receivable turnovers of the single proprietorships are significantly higher than corporations. Inventory and asset turnovers showed no significant differences. On leverage, results revealed that when the enterprises are grouped according to form of organization, there exists a highly significant difference in the debt ratio of the MSMEs ($t=5.949$, $p<0.01$). Further, it can be concluded that the leverage of the corporations are significantly higher than the single proprietorships. Finally, there is no significant difference in the profitability of the MSMEs in terms of return on sales, return on assets, and return on equity.

Results of the one-way analysis of variance on Table 6 show that there is no significant difference in the liquidity of the MSMEs when grouped according to type of business. The current and quick ratios reflect this finding. In terms of activity, results showed that at least one business type has a high significantly different asset turnover ($F=6.483$, with p-value less than 0.01). Consequently, the post hoc comparison test revealed the asset turnover of both manufacturing and trading businesses are significantly higher than those engaged in services (mean difference of 2.810, p-value less than .008 and mean difference of 2.416, p-value less than .005, respectively).

On leverage, results of the one-way analysis of variance show that at least one business type has a significantly different debt ratio ($F=4.148$, with p-value less than 0.05). Moreover, the post hoc comparison test disclosed that the debt ratio of manufacturing business is significantly higher than those engaged in trading (mean difference of 22.478, p-value less than 0.05, sig. 0.019). With respect to profitability, the one-way analysis of variance shows that when grouped according to type of business, there is no significant difference in the financial performance of the MSMEs in terms of return on sales, assets and equity.

Table 6: Difference in Financial Performance of the Msmes Grouped According to Type of Business

	Trading	51	-1.157	23.508	
	Service	27	6.015	20.996	
Return on equity	Manufacturing	21	2.447	6.285	.531
	Trading	51	.461	26.824	
	Service	27	6.319	26.317	

The table shows the results of the one-way variance analysis when the enterprises are grouped according to type of business. There is no significant difference in liquidity as reflected in the current and quick ratios. However, at least one business type has a high significantly different asset turnover and debt ratio. There is also no significant difference in the return on sales, assets and equity. Notation *** means the difference is significant at $p < 0.01$ while ** means that the difference is significant at $p < 0.05$.

Using one-way analysis of variance, the study found out that when the enterprises are grouped according to total assets, there is no significant difference in liquidity as manifested in the current and quick ratios (Table 7). In the aspect of activity, results showed that at least one MSME group has a significantly different accounts receivable turnover ($F=8.102$, with p-value less than 0.01) and asset turnover ($F=6.327$, with p-value less than 0.01). Also, the post hoc comparison test for accounts receivable turnover shows that the mean ratio of small enterprises is significantly higher than the micro enterprises as well as medium enterprises (mean difference of 119.785, p-value less than 0.01 and mean difference of 145.638, p-value less than 0.01, respectively).

Likewise, the post hoc comparison test for asset turnover shows that the mean ratio of small enterprises is significantly higher than micro enterprises as well as medium enterprises (mean difference of 2.319, p-value less than 0.05 and mean difference of 2.777, p-value less than 0.01, respectively). When grouped according to size of business, at least one MSME group has a highly significantly different leverage based on the debt ratio ($F=10.478$, with p-value less than 0.01). Moreover, the post hoc comparison test shows the debt ratio of medium-sized enterprises is significantly higher than micro enterprises (mean difference of 32.502, p-value less than 0.01, sig. 0.000). Finally, the study found out that when grouped according to size of business, there is no significant difference in the profitability of MSMEs as reflected in the return on sales, assets, and equity.

Table 7: Differences in Financial Performance of the Msmes Grouped According to Asset Size

	Small	27	5.276	7.157	
	Medium	27	2.054	14.653	

This table shows the results of the one-way variance analysis when the enterprises are grouped according to total assets. There is no significant difference in liquidity as manifested in the current and quick ratios. At least one group has a significantly different accounts receivable turnover, asset turnover, and debt ratio. There is no significant difference in the return on sales, assets, and equity. Notation *** means that the difference is significant at $p < 0.01$.

Table 8 summarizes the results of the test of difference in financial performance denoted as either significant (S) or not significant (NS).

Table 8: Summary of the Test of Difference in Financial Performance

	Form of Organization	Type of Business	Asset Size
Current ratio	NS	NS	NS
Quick ratio	NS	NS	NS
Receivable turnover	S	NS	S
	Single proprietorships have significantly higher receivable turn-over than corporations		At least one group has a significantly different financial performance; small enterprises have significantly higher receivable turn-over than micro and medium
Inventory turnover	NS	NS	NS
Asset turnover	NS	S	S
		At least one business type has a significantly different financial performance; asset turn-over of manufacturing and trading are significantly higher than those engaged in services	At least one group has a significantly different financial performance; small enterprises have significantly higher asset turn-over than micro and medium
Debt ratio	S	S	S
	Corporations have significantly higher debt ratio than single proprietorships	Debt ratio of manufacturing is significantly higher than those engaged in trading	At least one group has a high significant different financial performance; Medium enterprises have significantly higher debt ratio than micro and small
Return on sales	NS	NS	NS
Return on assets	NS	NS	NS
Return on equity	NS	NS	NS

This table summarizes the results of the test of difference in financial performance denoted as either significant (S) or not significant (NS). There are no significant differences in the liquidity, profitability, inventory turnover, return on sales, return on assets, and return on equity when the

enterprises are grouped according to the form of organization, type of business, and asset size. There are significant differences in the receivable turnover, asset turnover, and debt ratios in some groupings.

CONCLUDING COMMENTS

The study concluded that the subject MSMEs are of sound financial health in terms of liquidity, activity, and leverage. Overall, they are in a better position to meet currently maturing obligations, convert efficiently receivable and inventories into cash, and use ably credit to finance their business operations. On the contrary, the said enterprises are wanting in producing the returns necessary to maximize profit. The correlation revealed that a significant linear relationship exists between liquidity and activity, liquidity and leverage, and activity and leverage. However, the three performance measures showed no significant relationship with profitability. Conversely, it is clear from the study that while the MSMEs have high scores on liquidity, leverage, and most aspects of activity, they remain to suffer from a low profitability. The t-test showed there is no significant difference in the liquidity, profitability, and inventory turnover of the enterprises when grouped according to the organizational form, business type, and asset size. Nonetheless, a significant difference exists in the receivable turnover, asset turnover, and debt ratios. The t-test revealed that single proprietorships have significantly higher receivable turnovers than corporations, while small enterprises have significantly higher receivable turnovers than both the micro and medium enterprises. Both manufacturing and trading businesses have significantly higher asset turnover than those engaged in services while small enterprises have significantly higher asset turnover than both the micro and medium enterprises. Corporations showed significantly higher debt ratio compared with sole proprietorships; manufacturing business, compared with trading business; and medium enterprises, compared with both micro and small enterprises.

The subject MSMEs should revisit their strategies on the use of financial resources to maximize profit and the overall value of their business. Since liquidity, activity, and leverage have been the core advantages of these MSMEs, efforts should be geared towards improving profitability aspects. Mainly, the enterprises have to reexamine their cost structure, pricing policies, and expense management practices. They should also identify and assess the risks associated with their revenue generating activities. Since both liquidity and activity are related to leverage, these enterprises have to reassess how the former can further result in an optimum level of borrowing. Relatively, these enterprises have to take advantage of the use of borrowed funds and assess how optimal capital structures will maximize the value of the enterprises. In that way, the MSMEs will continue to play an important role in the growth of the economy. The study also brings about the need for business owners and shareholders to make use of financial performance information in coming up with vital and critical business decisions. The risks associated with profitability confirm the need of entrepreneurs to capacitate themselves on tools and techniques to better manage their finances. Moreover, entrepreneurs have to connect financial performance to the larger external environment of the business.

THE IMPACT OF CONSUMER BEHAVIOUR AND FACTORS AFFECTING ON PURCHASING DECISIONS

Ugwuanyi James Uchenna, Institute of Management and Technology (IMT) Enugu

ABSTRACT

Consumer behaviour of contemporary study, is why and how to buy or not to buy a product by individuals. This domain is combination of psychology, sociology, anthropology and economics and tries to know purchasing decision process (individual and group) better. Consumer behaviour is a new issue in marketing, Consumer behaviour is a controversy subject and challenging that includes individuals and what they buy, why and how to purchase them, marketing and marketing mix of market. In this work the researcher tries to study different factors affecting consumer behaviour and purchasing decisions.

JEL: M10

KEYWORDS: consumer behaviour, purchasing decisions, marketing mix, customer and culture.

INTRODUCTION

Outward-oriented companies, are companies that seeking to ensure customer satisfaction. The real mission of their marketing departments is understand the needs and demands of clients and provides proper solutions to the needs and desires of products. Outward-oriented companies are not companies that are just looking to sell, but looking for long-term customer satisfaction by providing top quality products with long-term goals and their own continued survival (kotler, Armstrong, 2000, p 86).

Marketing is a management task. Marketing focuses on achieve clients goals to achieve organization goals. Marketing is accompanied by understanding customer needs, developing products and services to meet these needs very satisfactorily the efficient pricing of products and services, inform and ensure customers about the availability of these products and services, delivered efficiently and ensure satisfaction during and after the exchange process. So marketing is an essential component of corporate. But many companies have bad interpretation and misconception of marketing. Some know marketing as fraud, deception, waste, annoying, unethical and unprofessional. Some also consider it equal to the advertising and sales. But in recent years the marketing separated from its old image and become increasingly isolated as one of the most important tasks in the business profitability of enterprises.

Traditionally, production and sales are two important tasks of any business. The second trend was that entrepreneurs were convinced that the quality of products or services is only factor that will determine their sell. But it's not take time too long, because in today's competitive market it's not true. Production, sales and marketing, need to work together to get the best results. Marketing is a responsible process for identifying, anticipating and satisfying customer profitable requirements. By This way, the organization will be able to put its products or services according to customer requirements and don't produce something and expect to reach customer (Shavpng, Hui Ming, 1997, p 273). Products (goods and services) must be consistent with the expected of customer benefits. Price should be moderate and commensurate with the product quality and buyer's potential. This product should be made available to the customer to avert any problem in purchase it and finally necessary promotional materials done to potential consumers to inform about such products. In fact, concept of marketing mix, organization's performance path by using a set of control variables in the environment that has many uncontrollable factors (Foreign market) defines (Bennett, 1997, p

Decisions that make for consumption demand for raw materials, transportation, technical services and the allocation of resources causes' success and failure of other industries. Thus, consumer behaviour is an important factor in recession or boom of commercial activity. Important factor in successful marketing and promotional strategies, understands of consumer behaviour. It is important for non-profit and for-profit organizations.

Definition of Consumer

Consumers are individuals or group who purchase goods and services to satisfy their personal consumption needs (kotler 2000, p229). It is very imperative that the marketers and marketing researcher have to understand the consumers and enable design strategies that will make it possible for the marketing practitioner not only to satisfy the consumers but equally to win consumers patronage. Prior to this, there are pertinent questions the marketing practitioners predicate their strategic actions, which include:

Who buys

How do they buy

When do they buy

Why do they buy

How do they evaluate the product service after purchase.

The company that really understands how consumers will respond to the different marketing mix has a great advantage over its competitors (kotler 2000, 209)

Consumers' Purchasing Decision Behaviour

Consumer behaviour defined as "The study of the processes involved when individuals or groups select, purchase, use or dispose of products, services, ideas or experiences to satisfy needs and desires." (Solomon, et al, 2010, p6). Another definition of consumer behaviour is "The dynamic interaction of affect and cognition, behaviour, and environmental events by which human beings conduct the exchange aspects of their lives"

(Bennett, 1989). Study of consumer behaviour has shifted from why people purchase to consumption behaviour (Blythe, 2008). One of the important aspects of consumer behaviour is market segmentation, because consumers within the segment are more or less similar in terms of products needs and desire (Lantos, 2011). Market segmentation consists of different categories for instance demographics (age, gender, social class), geographic (region, country differences), psychographic (personality, life style) and behavioural (Brand loyalty, benefit desire) (Solomon, et al, 2010).

Consumers' physical and social environment have huge influences on consumers' purchase decision and can make a big difference in their desire and motives for product purchase (Blythe, 2008). One of the important dimensions in consumer behaviour is social time, which means "The time in relation to social processes and rhythms and schedules in society such as working hours, opening hours, eating hours, and other institutionalized schedules." (Solomon, et al, 2010, p 68-69).

Consumers' purchasing decision and information search-Once a problem is recognized, consumers begin to seek about relevant information. There are two types of information sources; internal and external information search. Internal search involves the consumers' memory about the products, and external search includes word of mouth, stores visit, trial and online social networking and social media (Kardes, et al, 2011). Nowadays, online environment effectively involves in purchase decisions process and Internet has become an important tool for information search. The different types of decisions influence on the level and direction of the search (Hawkins& Mothersbaugh, 2010).

Consumers' purchasing decision and evaluation of alternative-In this step consumers start to compare and evaluate several alternatives in terms of products features and their desire and needs. Sometimes consumers' choices are based on simple decision such as "buy the cheapest products" but there are some decisions that are complex and consist of different processes and stages. In this stage consumers consider which alternative would be the best to fulfill their need (Blythe, 2008).

Consumers' purchasing decision and product choice (purchase decision)

Once consumers have found their relevant alternatives and evaluated them, they should make their choice among the alternatives. Consumers choose the certain products because the product appeals to them. The choice can be influenced by the gathered information from different sources therefore Internet is an effective tool in this stage (Hawkins & Mothersbaugh, 2010).

Consumers' purchasing decision and post-purchase evaluation-The quality of the decision becomes important in this stage of process and how well the choice worked out. Consumers start to compare their perceptions of the product with their expectations (Kardes, et al, 2011).

Consumer Behaviour and Its Key Concepts

Vilky and Salmon have defined consumer behaviour as follows: Physical activity, mental and emotional people do when select, purchase, use and dispose of goods and services to satisfy their needs. In another definition, consumer behaviour is described in this way: Series of activities directly toward the acquisition use and disposal of goods and services occurs. These activities

include the decisions that are made before and after the procedure. to know better Consumer behaviour Seven basic concept that has been emphasized by many scholars be examined .These concepts briefly are: 1) consumer behaviour is motivated .The most basic question about consumer behaviour is why consumer behaviour. Answer to this question can be traced to in definition of consumer behaviour, "so that the needs and wishes will be satisfy." In general consumer behaviour, a motivate behaviour that aim of it is achieving specific goals. The motives are the two types. One is Work motivation that is reason to by a product and related to the product performance in a way that helps to consumer to achieve goal. For example the motivation for a new car can be comfort and mobility, travel and ... Another motivation, personal motivation that related to a consumer wishes to express emotions or other things about his idea. Personal motivation for buying a car can be famous or like beautiful things.

2) Consumer behaviour involves a lot of activities. Each consumer has thoughts, feelings, plans and several buy decisions. Person, who only pays attention to purchase activities, ignored much of the activities associated with it. While marketers have explore a wide range of activities, including thinking about consumer product information, according to the advertising, purchase and re-refer the application to the satisfaction of the consumer.

3) Consumer behaviour is a process. As in the definition of consumer behaviour said and as mentioned above, consumer behaviour included a series of activities (selection, purchase, consumption, etc.) during the purchase and after the purchase is going as continuous process.

4) Consumer behaviour is different in terms of time and complexity. Meaning of amount of spending time in consumer behaviour is time that during it purchase decisions made or time duration of the purchase decision process and refer to the complexity of consumer behaviour in a number of activities and the difficulty of decision. Between duration and complexity of the decision, there is often a direct relationship, it means if condition is the same and other factors

Affecting the decision making process, whatever the decision be more complex, the time needed for whole process is more. Important point about these two factors is that the time and complexity of the decision process and consumer behaviour are different about different people and situation. For example, it is possible buy a car in certain circumstances for a person is very complicated but same circumstances for another person can be considered a simple process.

5) Consumer behaviour includes different roles. At least three different activities form within the process of consumer behaviour. In connection with each of these activities create a role for consumer.

The three roles are:

- A) Affective role on the purchase
- B) The buyer role
- C) The role of consumer

6) Consumer behaviour is influenced by external factors. Consumer decision process somehow influences by outside forces, but the effect itself is not bad or good. Some of these outside forces include culture, subculture, social class, family, environment marketing and...

7) Consumer behaviour is different for different people. Due to individual differences and the impact of outside forces on the different types of people, consumers have a variety of behaviours and these differences cause difficult to predict consumer behaviour and how marketing mix respond.

Factors that influence consumer purchasing decisions

Buying decision process influenced by two factors, controllable and uncontrollable that they are important cultural factors - social, group, and individual psychological factors, and situational factors guild working of the marketing mix.

Consumer involvement-As was mentioned, the motivation of consumers to achieve a specific goal impressed with the effort that he spent to achieve that product or service. Whatever consumers believe that product or services better to satisfy him. Conflict is defined as amount of importance that a person considers for in a particular position for a product and the benefits of it. Functional involvement of a person is product and position. The combination of these item in different times can be different in receive information on consumer motivation. When consumers are going to do something to meet their need and incentive to receive and processing of any information to achieve their goal. While another person may want to access the same information doesn't put in trouble because he thinks this information is not related to his need. Types of buying decisions and conflicts of consumer Purchases decisions are made by consumers are in the three groups: Complicated limit decisions, normal, every day.

1) Complicated decision-Decisions that are adopted to solve the complex problems are consistent with traditional decision making. Decision-making processes for solving complex problems, usually start with motivated to achieve a good. Decisions made are along with a lot of risk. The consumer tries to collect available information as possible, including its memory (local search) also external sources (external search). Each product base on importance of decision, carefully evaluated and between assessments the choice is made according to features of a particular brand.

2) limited decision making-Limited decision making is usually easier and more intelligible. Buyers have little incentive to collect information and are not strict evaluate the options. They use simple rules to select one of the options such cognitive causes the consumer instead of restarting making decision in future, to be able to a general guideline for this purpose.

3) Regular decision making-Complex and time-limited decision making some measurements and data collection provided. Many purchase decisions are made when the goods seen within the store shelf. Selection of such goods, with minimum effort and without prior knowledge of product features usually takes place automatically. Purchase based on habit and repeat purchase behaviour allows consumers to spend less energy to decision of buying this product. Decision making to purchase goods and services in these three categories can be better examined by five factors:

- Level of consumer involvement
- Time of the cost of a good or service
- Amount of data collected and the number of options

Perhaps can be said strongly level of consumer involvement is the most important determining factor in purchasing decisions of classification. When consumers are faced with complex decision making that they want to buy expensive products that they don't know a lot of thing about it. This process is the most complex decision making in purchasing. In decision making consumers are largely involved with the product. Complex decision making process is the same process that was introduced at the beginning of dissection means identification problem, gather information, and evaluate alternatives, purchase and post-purchase behaviour. This requires that users make the right decision. Therefore they should collected a lot of information about the product and brand and evaluate them. Buyers use a lot of factor to evaluate the available options; it is also allocate a great time to gather information. For example, buying a car or house is a complex decision making.

3. Determinants factor of consumer involvement-Involvement rate in purchasing is dependent on the following factors

Previous experience, interest rates, risk status, and social perspectives.

1. Previous experience-When consumers experience about product or service, usually after use samples of the goods learn to make choices quickly. Because they are familiar with the product and find that it can satisfy their need and therefore reduced the level of conflict.

2. Interest-Level of conflict, is directly link with their interest. For example, some people are interested in cars and music ... Usually variety of topics that people are interested in them is from person to person.

3. Risk taking-Whatever, risk taking of a person in buying a product increase, Level of consumer's conflict, also increase. Types of risks that consumer involved with it are financial risk, social risk and psychological risk. Financial risk refers to the loss of a person's wealth or purchasing power because high risk associated with the high risk of expensive purchase. For this reason, many consumers are willing to struggle with the goods. For example, someone who wants to buy a house, spend a lot of time and effort to make the correct decision. Consumers when accept community risk that buying goods able to influence people opinion. For example, driving with an old car can have influence on public opinion to person. Also, consumers suffered psychological risk when feel making a mistake can lead to anxiety and worry. For example, can refer employees parents o keep their children that they can hire a baby sitter or bring him to the kindergarten.

4. Position- Purchase conditions may be become from a low-involvement to a high involvement decision. For example, a person eat sandwich for everyday lunch, but when he goes out to eat with his boss invite him to a luxurious restaurant.

5. Social visibility-Whatever the social visibility of a product increase, its involvement level with product will increase. Products often indicate the social status of their owners. Goods like clothing (famous brand) cars and ... Indicate the status of the person in society associated with social risk.

4. Why study of consumer behaviour is important?-Studies of consumer behaviour, is the result of marketing trends, products and product trends in the philosophy of turning sales and marketing trends. Other factors involved in the development of consumer behaviour: the fast introduction of new products, short product life cycles, increased Consumer protection movements by private groups and public policy, the environment, development and marketing services. In such an environment, having a proper understanding of the consumer and the consumer, there are several advantages. In such an environment, having a proper understanding of the consumer and the consumer, have several advantages. These benefits include helping managers to make decisions, provide a basis for understanding the behaviour of consumers, to help legislators and regulators to enact laws relating to the purchase and sale of goods, services, and ultimately consumers to make better decisions. Consumer behaviour plays a crucial role in the design of promotional campaigns. With science of the behaviour of the audience can choose appropriate media and message. In addition, study consumer behaviour can help to understand concept of social sciences that affect human behaviour. Accordingly, the analysis of consumer behaviour in areas such as design, marketing mix, market segmentation and product positioning and differentiate the necessary and vital. Analysis and study of consumer behaviour

Following questions:

1. How people become aware of the particular need for goods or services?
2. How consumers find their product or service?
3. How consumers do the final selection?
4. What happens when the product or service are provide?
5. How your product choice?
6. How will you pay money for a product?
7. How your product is stored?
8. How transfer your product?
9. How customers use your produce?
10. When customers are using the produce, what help they need?
11. Are there possible to refund or exchange? What is it?
12. How is your product repaired or serviced?
13. What happens when your product is consumed and finishes it use?

5. Perspectives Research of consumer behaviour- A key feature of consumer behaviour is the research base. Research conducted on consumer behaviour divided into three aspects the classification as a guide helps how to think and identify factors affecting consumer behaviour. Decision point: During the early 1970s, 1980s, researchers had focused on the idea that consumers are rational decision for borrowers. Roots of This approach are in cognitive psychology and economics. In This approach evaluated on how consumers through a series of steps try to solve the problem logically. This process includes the detection, investigation, evaluation of alternatives, selection and evaluation after acquisition. Experimental approach:

This approach is based on the assumption that consumers often do not buy base on a perfectly rational decision. In contrast sometimes they attempting to purchase for fun, fantasy and emotions are to goods and services. The roots of this perspective are in motivational psychology, and areas of sociology and anthropology. Researchers who use Experimental approaches, use of interpretive methods. Analysts to gain an understanding of the process, even record folklore and traditions of the community.

6. Behavioural perspective- The peripheral vision is assumed that strong forces are directed toward consumers who no strong feelings or beliefs of the pre-made plans to buy a product. At this point, the consumer through the process of rational decision-making or based on emotion, do not buy the product. Instead, his buy directly cause by affect of behaviour caused by environmental forces such as sales promotion tools, cultural norms, physical environment and economic pressures. At the end, it is necessary

to note that most purchases are made with elements from each of the three perspectives. [1] Wilkie [2] Solomon

Many marketing managers, put base of relationships with customers based on a procedure that is called "individualism", "customer-oriented mass" or "customize". Core of this style, adapted to the needs and demands of individual goods and services for customers, not just one type of goods and services provided to all customers. Thus, we can also assume customize the marketing mix as a factor At Knarmhsvl, price, promotion, place, personnel, physical assets, and procedures (processes) . In this way, a new marketing mix formed with 48 (Gold Smith, 1999, p 179)

Consumer buying behaviour-Consumer buying behaviour has always been regarded as a matter of marketing. Consumer behaviour is based on the following five steps:

- 1) Identify the problem
- 2) Search
- 3) Evaluate Options
- 4) Decide to Buy

5) After purchasing behaviour (Kvnstantynydydys, 2004, pp. 111)

Figure 1, the shows model and the variables that influence consumer buying behaviour as well. This model recognized by marketing professionals and based of consumer buying behaviour is based on this model. (Smykeen, 2000, p 154) As can be seen at this model, individual stimuli (social, psychological, and interpersonal) and external stimuli (environmental, organizational and interpersonal) affect consumer buying behaviour at different phases.

Buyer Orientation- In general, a buyer in the purchase of goods and services doesn't have detailed information of the other marketing mix elements. Buyer Orientation refers to the process in which potential customers think, evaluate, discuss and finally decide on a suitable source of supply for purchase product. The process of finding the source of the customer calls "customer orientation". Buyer Orientation generally contains fifth dimension that are the value, performance, value and benefits of diversity. At following sections details of each of these dimensions is discussed. (Bennett, 1997, p 152)

Value-Apart from the obvious attributes such as quality, fitness for purpose, reliability, etc., price, performance and reputation of the supplier to the buyer are important. In addition, the buyers looking for capacity of technical and symbolic features like being unique, and non- replacement and state of brand .but, there are other considerations. Value, Does not depend on money and other issues are important to buyers. Such as physical effort, distance and time needed to find a good source of product supply. Also, problems such as through a sole source of supply of the product and are also effective.

Performance- Legitimate and efficient source of product delivery can depends on a person close to the source. So distance is important for the buyer. Distance to not only depend on access, choice, freedom to choose and can afford depends on the buyer, but also depend amount of time that is often the most important factor. Reputation and brand power, repeatability shopping, shopping results, and the shape of shelves are also effective performance. Performance generally occurs when the buyer is generally accessible to be supplied in accordance with your expectations.

Value-One of the problems associated with the investment objective of the model is seen at marketing is the limited nature of some products (goods and services for) for delivery to the buyer. For example, a mechanical device that needs to be forced to buy a complete set of parts, but have to take the dress the minimum rental period is three days. These are examples of the savings of scale in the store and seem cannot attract favourable comments buyer. In fact, the savings in terms of cost is at the expense of the

Buyer. Amount says to factors, including quantity, frequency, distribution capabilities, stability, parts, depending on the size and.

Variety-Customers need to have the freedom of choice. A choice often ignored by manufacturers and marketers of goods and services. Selecting is inalienable right customers and is essential in effective marketing. Many people are limited in their choice. Deeper understanding of After Variety can create a broader perspective of the consumer. But the choice is not only offering a variety of products, but also with a variety of prices, payment and delivery of Variety styles, variety of after sales services, insurance, warranty and Can be guaranteed. Savings scale of the supplier cause product is non-diversified, which is a negative for suppliers. For example, a clothing store, the buyer select the desired size limitation, the potential failure of a buyer and critical situations change brands or change supplier.

Benefits-Customers will see the benefits of the product and see if it meets their expectations, then continue relationships with providers. The essential nature and consistent of finding the source process depends on that the customer recognize intended resource offer the best benefits.

Buyer behaviour and marketing mix-To determine the relationship between buyer behaviour and marketing mix, Criteria to specifying trends and buyers in the marketing mix analysis are consistent with each other in a matrix. Table 3 show the superposition. This matrix structure of an integrated approach to marketing and direct communication between customer orientation (5V) and the marketing mix (4p). Marketing states that the product can be described with a distinct marketing mix. The allocation of corporate resources to provide goods and services, such strategies will ultimately lead to achieving corporate objectives (Bennett, 1997, p 154). Customers are trying to find a way to rationalize their goods and services. This process of finding source cause customer refers to a specific resource for products. In This process, 5V is a source to enable the buyer to logic chooses of goods and services works (Bennett, 1997, p 154). Marketing mix come in the rows and columns with 5V. In matrix, buyer activity is shifted from left to right. This process is known as buyer interest. In the marketing mix, supplier should understand how buyer tendency is for each buy? (Bennett, 1997, p 154).

CONCLUSIONS

The aim of marketing concept is to satisfy the consumer at a profit. Business alliance is an efficient route of escape from the storm of competition. However, this advantage should not based on theory because practically in this industrial revolutionary era, business is like cold war, mostly in capitalize economy. In today's competitive world, companies to achieve a competitive advantage should have high attention to customers and their needs (better than competitors). Furthermore, customers in buy products have different orientations that they should be considered in the formulation of Marketing strategies. If the marketing mix is in line with customers' objectives and interests of the customers, in addition to covering the interest, The Company's competitive position relative to competitors in the market will have a very good point and increase the company's profitability in the long term. Market segmentation techniques typically consider client needs with high volume, but the tendency of the buyer tries to prevent. In addition, the buyer tends to show marketing manager's strategic focus should on what and where. And it happens that if buyers tend to be carefully examined. In addition, the fields of marketing management, marketing research and product development can be identified. As a result, the interest of the buyer and its relationship with the corporate marketing mix, opportunities for buyer's orientation from the perspective of consumer behaviour can be obtained using this technique. Tendency of shopper's help marketers understand how and why consumers are buying.

CAPITAL BUDGETING PRACTICES OF FIRMS: EMPIRICAL EVIDENCE FROM GHANA

Paul Kofi Oppong-Boakye, Kwame Nkrumah University of Science and Technology
Emmanuel Addai, Kwame Nkrumah University of Science and Technology

ABSTRACT

This study examines capital budgeting practices of firms in Ghana. The main aim of this study is to ascertain the capital budgeting techniques used by companies in Ghana. The study reveals that approximately 63% of companies in Ghana use more than one technique in capital budgeting analysis. 84% of the companies that adopt multiple techniques for the purpose of investment appraisal use the combination of net present value and the pay back period while the remaining 16% use the combination of net present value, internal rate of return and the pay back period. None of the companies in the study uses the accounting rate of return or the accounting rate of return in conjunction with other techniques.

KEYWORDS: Capital Budgeting, Ghana

INTRODUCTION

Capital budgeting is a key issue in corporate finance. With limited credit and other sources of financing in today's uncertainties and challenging economic environment, the need to carefully evaluate the profitability of proposed capital investments is more important. Its importance is derived from the fact that the primary goal of every management of an organization is to maximize the wealth of its shareholders. According to Brigham and Ehrhardt (2008) capital budgeting is the decision process that managers use to identify those projects that add to the firm's value. Funds should therefore be made available for any project that promises returns in excess of an appropriate risk-adjusted required rate of return. (Denzil and Head, 2010).

An appraisal system which leads to failure to apply resources to areas which provide a return less the cost of capital results in an opportunity loss (Arnold, 1998). To avoid such a situation, firms use a variety of capital budgeting techniques to evaluate investment projects. Popular among these techniques are payback periods (PBP), internal rate of return (IRR), net present value (NPV), discounted payback period (DPP), profitability index (PI), and accounting rate of return (ARR). Financial managers and academics have not been in full agreement as to the choice of the best capital budgeting method (Ryan and Ryan, 2002). Text books tend to emphasize the NPV rule, often arguing that it is theoretically superior to other methods (e.g. Zimmerman, 1997). On the contrary, surveys on capital budgeting practices across the globe especially in the U.S and the U.K have proved otherwise. Several research works have been done to determine the technique firms' use in evaluating capital investments in the developed economies such as the U.S and the U.K. However, much has not been done to determine which techniques firms in developing countries such as Ghana use in evaluating their capital investments. This study of capital budgeting practices of some selected manufacturing companies in the Kumasi Metropolis was therefore carried out to determine which techniques firms in Ghana use in evaluating capital investments as well as assessing the risk of major investments.

LITERATURE REVIEW

Brigham and Ehrhardt (2002) defined capital as the operating assets used in production. Whiles they defined a budget as a plan that details projected cash flows during some period. Capital budgeting is broadly defined as the systematic evaluation of how much capital to invest in a project or assets and the specific assets companies should use to meet their investment objectives (Cubbage and Redman, 1985). Capital budgeting

decisions are unavoidable if managers want to meet the primary goal of maximizing shareholders' wealth. There are several sequential stages in capital budgeting process. For most large firms, the investment process starts with the preparation of an annual capital budget (Brealey, Myers and Allen). Maccarrone (1996) argued that capital budgeting should be held in the wider context of strategic planning. Because capital investments are so important to the success of the organization, most companies have formal policies of guiding the decision process (Seitz and Ellison, 1999).

Several methods or techniques are used to rank projects and to decide whether or not they should be accepted for inclusion in the capital budget. The payback period (PBP) method is described as the first formal method used to evaluate capital budgeting projects (Brigham and Ehrhardt 2002). Van Horne and Wachowicz (2005) defined payback period as the period of time required for the cumulative expected cash flows from an investment project to equal the initial cash outflows. Many reasons have been cited for the use of payback method. Seitz and Ellison (1999) stated that simplicity was one reason for the popularity of the payback method since it could be easily established. They further argued that payback period was also used as a measure of risk. Managers often believe that the longer it takes to recover the original investment, the more chances there are for something to go wrong.

One the contrary, the payback has been described as theoretically irrelevant and mistaken because it ignores the time value of money and cash flows beyond the cutoff point. Surveys such as that of Graham and Harvey (2001) found that 52% of firms in the U.S used PBP to evaluate capital investments while in the U.K, it was found that 63% of the firms also used PBP to evaluate capital investments (Drury and Tayles, 1996). Some firms use a variant of the regular payback, the discounted payback which is similar to the regular payback except that the expected cash flows are discounted by the project's cost of capital. According to Bhandari (1989), by accounting for the time value of money and objective decision rule the discounted payback period (DPP) overcomes the two serious limitations of the PBP. According to Drury and Tayles (1996), 42% of firms in the U.K used the DPP technique to evaluate their investments and Graham and Harvey (2001) also found that in evaluating investments in the U.S, 29.45% of firms also used the DPP technique.

Ross, Westerfield and Jordan (2000) defined discounting as the process of valuing an investment by discounting its cash flows. The main discounting techniques are the net present value (NPV), internal rate of return (IRR) and the profitability index (PI). These methods incorporate the concept that money has an opportunity cost and time value of money. Van Horne and Wachowicz (2005) defined NPV of a project as a present value of an investment net cash flow minus the project's initial cash outflow. The NPV is seen by most researchers or authorities in finance as the most desirable capital budgeting technique. Under the NPV rule, it is expected that projects with net present value equal to or more than zero should be accepted; if not it should be rejected. The NPV approach assumes that a firm correctly estimates incremental cash flow from each of the available projects, discounts cash flow of each project using a discount rate that corresponds to the risk associated with each project, and accepts all projects with positive NPV (Mukherjee and Henderson, 1987). Unlike the PBP and the DPP criteria, the NPV considers the time value of money and all cash flows throughout the lifespan of the project. The NPV is considered the most desired technique because it is able to tell whether the investment will increase the firm's value and also considers the risk of future cash flows through the cost of capital. Notwithstanding the strength of the NPV criterion, it requires an estimate of the cost of capital in order to calculate the present value which might be very difficult exercise.

Another discounting technique, IRR has been described as the most important alternative to the NPV. It is defined as the discount rate that results in a net present value of zero. The internal rate is the rate earned on money committed to a capital investment and is analogous to interest rates generally quoted in the financial market place (Seitz and Ellison, 1999). They pointed out that, IRR states the profitability of an investment in terms that are generally familiar to managers whether or not the managers have strong financial

background. According to the IRR rule, an investment should be accepted if its IRR is higher than its cost of capital and should be rejected if it is lower. Gitman and Forrester (1997)'s research based on a survey on 268 U.S. firms, found that the IRR was the most popular technique at that time. His finding was supported by a similar survey conducted by Scott and Petty (1984) for large firms in the U.S. A project's profitability index (PI), another discounting technique, is equal to the ratio of the present value of its expected cash flow stream. The profitability index is a benefit-to-cost ratio because it is the ratio of the benefit derived from the investment (the present value of its expected cash flow at the cost of capital) to its cost (the initial outlay). According to the profitability index rule, a project should be accepted if its profitability index is greater than one and rejected if it is less than one.

The accounting rate of return (ARR), also known as Return on capital employed (ROCE) or return on investment (ROI) differs from other evaluation techniques in that, it focuses on accounting profit rather than cash flow. It is defined as the ratio of average accounting investment. The ARR indicates a company's efficiency in generating profit from its assets base. To make an investment decision, the accounting rate of return is compared to a standard, such as the existing average accounting return on the company's assets, or to the company's target accounting return on investment. A central aspect of capital budgeting theory is the concept of risk. Risk is generally defined as any possible deviation of cash flows from the expected or most likely estimate. In the context of investment appraisal, risk refers to the business risk of an investment, which increases with the variability of expected returns (Denzil and Head, 2010). There are several methods of assessing risk and of incorporating risk into the decision making process. A more common way of assessing the risk involved in a project is sensitivity analysis. This is a way of assessing the risk of an investment project by evaluating how responsive the NPV of the project is to changes in the variables from which it has been calculated (Denzil and Head, 2010).

Sensitivity analysis can only provide an indication of what will happen if deviations from expectation occur; it does not provide an indication of the likelihood that such errors will occur. Another way of considering the risk of a project is simulation analysis. Simulation analysis is a risk evaluation technique in which a large number of computer trials are taken to derive a distribution of the expected return of an investment project and a possible variability of that return. The overall objective of simulation is to obtain the expected return of a project and an indication of the variability of that project (Hertz, 1964). There is a very low level of the use of simulation analysis. Drury et al. (1993) found out that, more than 95% of companies rejected simulation analysis. Another more sophisticated way that has been suggested to take risk and uncertainty into account is to specify distributions of possible outcomes for each variable, assign subjective probabilities as to the likelihood of these probabilities occurring and then calculate an 'expected' value from this distribution by multiplying each outcome by the probability of its occurrence. According to Denzil and Head (2010), the risk of an investment project can be examined in more detail by calculating the probability of worst case and the probability of failing to achieve a positive NPV.

Another ways of assessing risk of an investment project is to raise the required rate of return or shorten the payback period. Other methods such as CAPM (also known as beta analysis) and subjective or managers' intuition are also used. The most important, but also difficult step in capital budgeting is estimating project cash flows. It is vital to identify the relevant cash flows, defined as the specific set of cash flows that should be considered in the decision at hand. Brigham and Ehrhardt (2008) identified two cardinal rules that can help one to minimize the mistakes that are likely to be made in the estimation of cash flows. They were of the view that capital budgeting decisions must be based on cash flows, not accounting income and only incremental cash flows should be seen as relevant. Poor estimation of cash flows will result in poor decision irrespective of the model being used. Included in the cash flow estimation is opportunity cost and interest expense. In a sophisticated capital budgeting exercise given unbiased estimates of cash flows, the only remaining task in computing the NPV is to choose an appropriate discount rate reflecting the project's risk. Using of the proper discount rate depends on whether the benefit and cost are measured in real or nominal cash flows. To be consistent, the cash flows should match with the discount rate. The cost of capital is the

required rate of return on the various types of financing. Both the cost of equity and the cost of debt depend on the firm's debt ratio. The higher the debt ratio, the higher the financial risk and the greater the returns required by shareholders and bondholders. Cost of debt and equity are used to estimate the project's cost of capital. In practice, however, it is assumed that the cost of debt is less sensitive to changes in financial leverage than is the cost of equity.

DATA AND METHODOLOGY

using semi-structured questionnaires. The initial sample size was 35, but 30 firms showed their interest in the study by filling the questionnaires. The questionnaires were pre-tested removing biases from the study to ensure validity.

RESULTS AND DISCUSSIONS

Profile of Respondents

Table 4.1 below depicts the profile of the respondents in the study.

Table 4:1 Profile of Respondents in the Study

Industry	Frequency	Percentage
Wood Processing	7	21
Paper Products	2	7
Food & Beverages	4	14
Steel Processing	7	24
Pharmaceuticals	4	14
Rubber Products	3	10
Agriculture	3	10
TOTAL	30	100

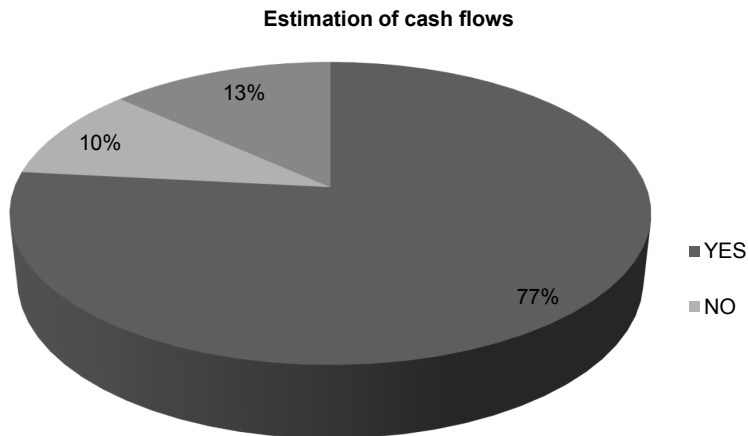

Annual Capital Budget Size The study asked the firms to indicate the average size of the firm's annual capital budget. Although all the firms are large, the size of the annual capital budget did vary among the respondents. The size of the annual budget is shown on table 4.2 below.

Table 4: 2 Annual Capital Budget

Annual Capital Budget	Frequency	Percentage
Up to GH¢ 1 Million	3	10
GH¢ 1 Million - 5 Million	14	47
GH¢ 5 Million - 10 Million	7	23
GH¢ 10 Million - 15 Million	3	10
GH¢ 15 Million - 20 Million	1	3
GH¢ 20 Million or more	2	7
TOTAL	30	100

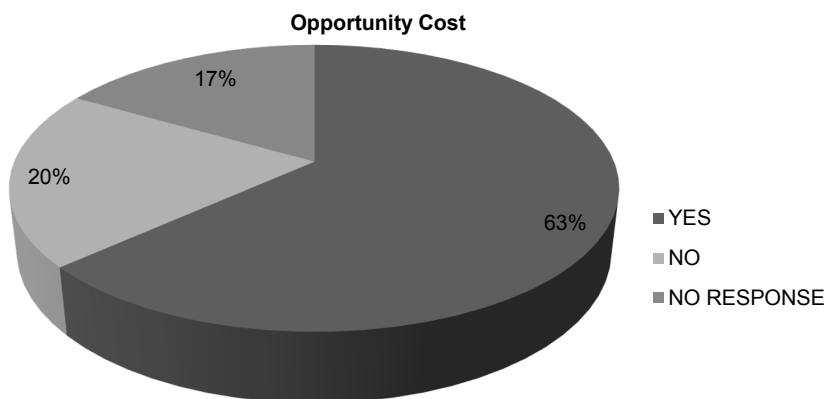

The response to these questions which indicate that 17 companies (56%) spent less Gh¢5million per annum on capital investment provides a good spread of the different size of the firms' annual capital budget. **Estimation of Cash flows** Regarding the estimation of cash flows, the respondents were asked to indicate whether they made an estimate of the cash flow they intend to generate from their capital investments. Unfortunately, this study does not query firms as to which methods they use to arrive at cash flows. Results on whether they estimate the cash flows of their projects are shown in figure 4.1.

Figure 4:1 Estimation of Cash Flows

This study reveals that 23 firms representing 77 percent of respondents make an estimate of future cash flows while 4 firms representing 13 percent reported that they do not forecast cash flows. Three (3) firms representing 10 percent of respondents did not answer this question at all. Cash flows and Opportunity cost Opportunity costs are cash flows that could be generated from an asset the firm already owns, provided the asset is not used for the project in question (Brigham and Ehrhardt, 2008). Figure 4.2 gives a summary of the response given by respondents. According to the study, whereas 63 percent of respondents include opportunity cost in the project cash flow, 17% do not and 20% have no idea.

Figure 4:2 Opportunity Cost

Cash flow and Interest expense

One common mistake that firms make is to subtract interest expense when estimating project cash flow. This study attempts to find out whether firms in Ghana include or subtract interest expense from projects' cash flow. The study reveals that 70 percent of respondents included interest expense in the project cash flow. They opined that subtracting the interest expense from a project's cash flow amount to double counting interest cost since cost of debt is always embedded in the cost of capital used to discount the

project's cash flow. Contrary to the above, 10 percent do not include interest expense and 20 percent had no idea about this and therefore provided no answer to this question.

Figure 4:3 Interest Expense

Capital Budgeting Techniques

One of the main goals of this survey was to determine the capital budgeting technique(s) used by firms in Ghana. Several techniques are available to assist a firm in evaluating a capital budgeting project. The four most commonly cited methods are PBP, ARR, IRR and NPV. The respondents were asked to indicate the capital budgeting technique(s) normally used, including multiple techniques. Their response are summarized in table 4.3

Table 4: 3 Capital Budgeting Techniques

Techniques Used	No. of Firms	Percentage (%)
ARR	0	0
IRR	0	0
NPV	7	23.3
PBP	4	13.3
ARR, IRR	0	0
ARR, NPV	0	0
ARR,PBK	0	0
IRR, NPV	0	0
IRR, PBK	0	0
NPV,PBP	16	53.3
ARR, IRR, NPV	0	0
IRR, NPV, PBP	3	10
ARR,NPV,PBP	0	0
ARR, IRR, PBP	0	0
ARR, IRR, NPV, PBP	0	0
TOTAL	30	100

As summarized in the table above, approximately 63 percent (19 out of 30) of respondents said that they use more than one capital budgeting technique for evaluating their capital investment proposals. 84 percent of companies that use multiple techniques representing 53 percent (16 out of 30) of total respondents used both NPV and PBP to evaluate their investments. The other 16 percent of companies that use multiple

techniques representing 10 percent of total respondents relied on NPV, PBP and IRR. This result is consistent with the results of Verma, Gupta and Batra (2009) which reported that 90 percent of companies they studied were using more than one method for evaluating investment proposals. A survey by Farragher, Weiman and Sahu (1999) concluded that 78 percent of America companies used NPV while Graham and Harvey (2001) gave a similar result, reporting that approximately 75 percent of U.S companies also used NPV. This study on the other hand, reveals that approximately 23 percent (7 out of 30) of companies surveyed use the NPV to evaluate projects. This result is also in conformity with theory which considers NPV as the superior capital budgeting technique.

The study further reveals that 13 percent of respondent companies use the PBP as against 63 percent in Great Britain as reported by Drury and Tayles (1996). Surprisingly, none of the respondents used ARR or IRR or both as single or multiple capital budgeting technique(s) to evaluate their investments. But interestingly, three (3) companies representing 10 percent of respondents used IRR as supplementary technique to PBP and NPV when multiple techniques are used to evaluate projects. Use of Capital Budgeting Techniques Respondents were asked how frequently they use four capital budgeting techniques: PBP, NPV, IRR and ARR. The responses were on a four point Likert scale with the following alternatives: “sometimes”, “often”, “always” and “never”. Table 4.4 portrays the response given by respondents.

Table 4:4 Use of Capital Budgeting Techniques

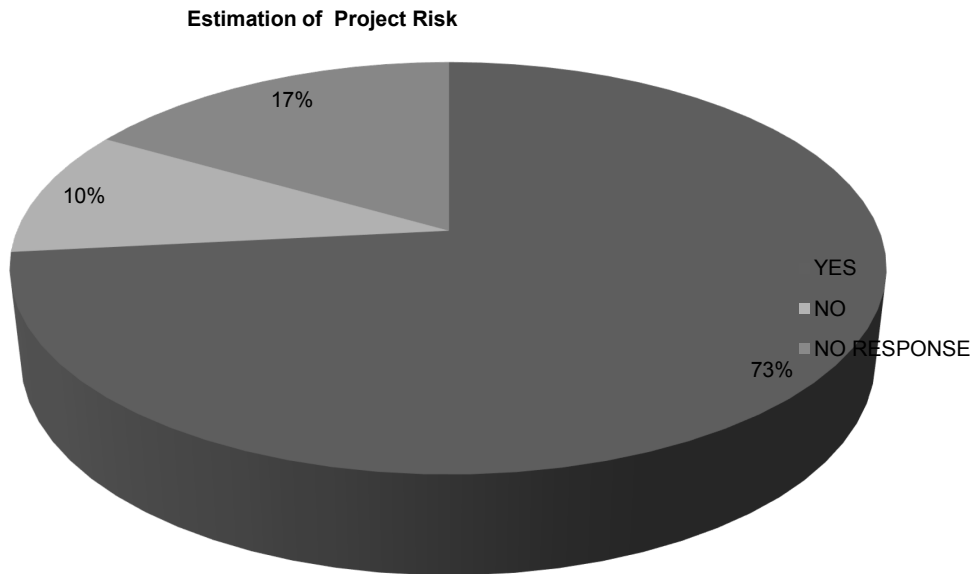

Technique	Sometimes	%	Often	%	Always	%	Never	%
PAYBACK	16	53.3	3	10.0	4	13.3	7	23.3
ACCOUNTING RATE OF RETURN	0	0.0	0	0.0	0	0.0	30	100.0
NET PRESENT VALUE	12	40.0	7	23.3	7	23.3	4	13.3
INTERNAL RATE OF RETURN	3	10.0	0	0.0	0	0.0	27	90.0

Source: Author's field work, July 2012

From table 4.4 above it can be seen that whereas only 7 companies representing 23% had never used payback period, 90% (27) and 100% (30) had never used IRR and ARR respectively. However, only 4 representing (13.3%) indicated that they had never used NPV. It could also be seen that NPV is used most often that any other method. This supports the idea put forward by Ryan and Ryan (2002) who reported that NPV was always utilized by 49.8 percent of the respondents and frequently (“always” and “often” combined) used by 85.1 percent of the respondents.

The cumulative use of NPV rose to 96 percent of total respondents when the “sometimes” category was included. Their report conforms to this study when which also give a cumulative use of 86 percent when the “always”, “Often” and “sometimes” categories are combined. Estimation of Project Risk This study further seeks to determine the technique(s) that companies in Ghana use to assess the risk of major projects. To achieve this objective, respondents were asked in a simple categorical term to indicate whether or not they estimate risk of a project when making capital investments.

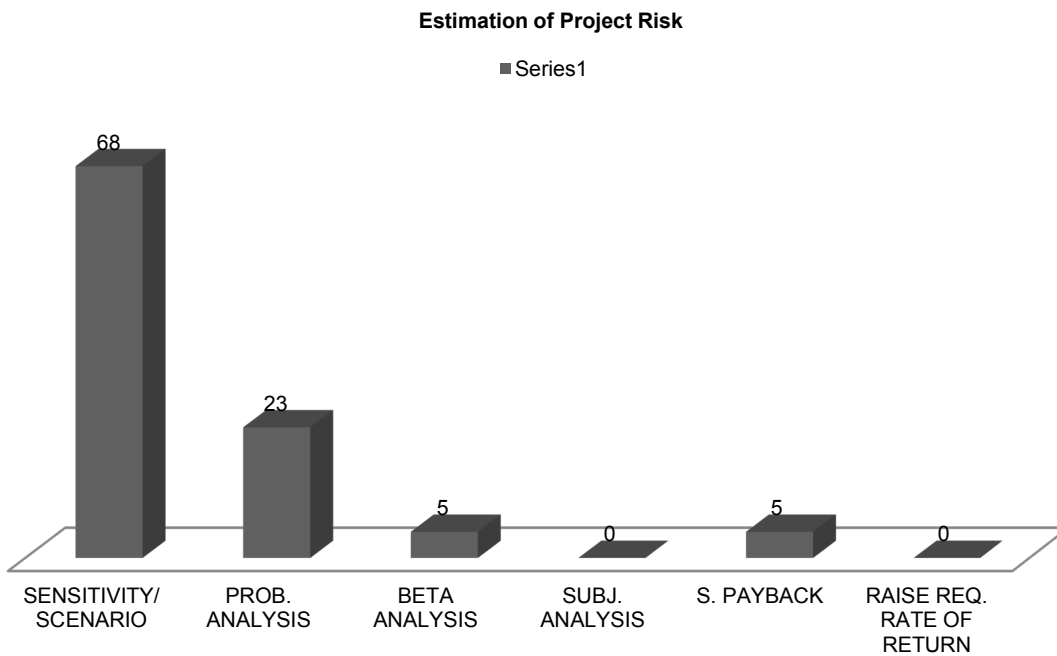

Figure 4: 11 Estimation of Project Risk

Source: Field work, July 2012

As shown on the chart above, majority of firms in Ghana constituting 73 percent required a formal evaluation of risk and 10 percent of the respondents did not required formal risk evaluation while 17 percent did not answer. In 1975 a minority (28%) of large firms in the U.K required a formal risk evaluation (Pike, 1982) but this figure rose to 94 percent in 1997.

Figure 4: 12 Estimation of Project Risk

Source: Field work, July 2012

From the chart above, it can be deduced that the most widely used risk analysis technique is sensitivity/scenario analysis. Of the 22 firms that estimated risk, 68 percent (15 out of 22) use it followed by probability analysis with approximately 23 percent (5 out of 22). This report conforms to a result reported by Arnold and Hatzopoulos (2000). They stated that 85 percent of firm in the U.K used sensitivity/scenario analysis. Beta analysis and shortening payback are also rarely used by companies in U.K. However, they hinted sensitivity/scenario analysis was used in conjunction with raising the required rate of return and/or subjective assessment.

CONCLUSION

The study looked at capital budgeting practices in Ghana which covered 30 manufacturing companies selected in the Kumasi Metropolis. The study reveals that approximately 63% of companies in the study use more than one technique in capital budgeting analysis. Most companies that used multiple capital budgeting techniques also use the combination of NPV and PBP than any other combination. Project risk estimation is undertaken by majority of firms in the study. Regarding techniques used to estimate project risk, the study indicated that sensitivity/scenario analysis is widely used by companies in Ghana. Since the Kumasi metropolis was studied, we intend to expand the study to cover other parts of Ghana to determine other empirical results.

FISCAL POLICY AND THE ECONOMIC RECOVERY

Paul R. Kutasovic, New York Institute of Technology

Pedro Peixoto, New York Institute of Technology

ABSTRACT

The US economy is now in its fifth year of economic recovery. Comparing performance, measured by various economic indicators, of the current recovery with prior business cycle expansions confirms the popular opinion of a subpar recovery and one that clearly differs from the typical pattern of growth in prior cycles. The recovery is characterized by tepid employment growth, restrained business spending, ongoing weakness in housing, growing income inequality and sluggish wage growth. As a result, economic activity is about \$800 billion below its potential. So, why has the recovery been so tepid? In answering this question, it's important to recognize that a variety of factors are at work. First, the economy still bears the scars of the housing bubble and crash. Second, in contrast to any of the prior expansions, unprecedented fiscal consolidation occurred during this cycle through higher taxes and reduced spending at various levels of government. This study offers evidence showing that the weak recovery in US economic activity and sluggish wage growth is largely a result of this contractionary fiscal policy. A VAR model of the US economy is used to estimate economic growth during the current expansion under different fiscal policy scenarios.

KEYWORDS: Austerity, Fiscal Contraction, Sluggish Expansion, Multiplier

INTRODUCTION

The US economy is now in its fifth year of recovery following the Great Recession of 2007-09. Although things have improved significantly since the end of the recession, the pace of recovery has been moderate at best. This article looks at some possible reasons underlying the sluggish recovery focusing on the role of fiscal policy. The study is organized as follows: section 2 provides an analysis of the factors holding the recovery back, section 3 examines fiscal policy in the current cycle, section 4 examines the issues surrounding private versus public employment and wages, section 5 examines the theoretical framework for fiscal policy, section 6 looks at empirical estimates. The paper ends with conclusions and future work in section 7.

Factors Holding Back the Recovery

Since the recovery began in the summer of 2009, output growth has been disappointingly slow with real GDP growth averaging a sluggish 2.2%. Progress has also been slow on the job front with the job growth in the current expansion being the weakest since the 1950s. With gains of nearly 10 million jobs since early 2010, the economy finally exceeded its previous peak of January 2008 in late 2014. The question is: why has the recovery been so tepid? There are a number of factors accounting for the slow growth. First, the economy is still bearing the scars of the mortgage-fueled housing bubble and financial market crisis. Although housing has stabilized over the last few years, activity in this sector is still well below that before the recession. Housing starts for the first half of 2014 at around 1 million units are well below the near 2 million starts in 2004 and 2005. Even after double-digit price increases, houses are still 15 percent below their peak value, on average. Second, business investment has expanded but at a sluggish rate. This is not surprising given the weakness in final demand and significant overcapacity in many sectors of the economy. Recent data on capital good orders show some improvement in this sector.

Third and most important, the main factor holding back the recovery has been the public sector. Austerity at the state and local and federal level has reduced aggregate demand to an unprecedented extent during this recovery. In each of the previous 11 business cycle expansions in the post-World War II period, government spending was a key driver of growth. This was not case in this recovery. In contrast, the private sector showed reasonable growth in the recovery. Finally, weakness in Europe, largely the result of austerity measures, reduced the demand for US exports. The case that austerity is actually expansionary has been made by a number of European policy makers including the European Central Bank and the German government (IMF, 2010). The argument is that doing so would reassure investors and induce business investment, generating growth and jobs. In Europe, it didn't happen that way. Moreover, the empirical case for expansionary austerity has collapsed on close examination of the data. The Canadian and Swedish experience in the 1990s cited as examples have been debunked. An IMF study (2010) of 173 fiscal-policy changes in advanced economies from 1978 to 2009 found that cutting a country's budget deficit by 1% of GDP typically reduces real output by about two-thirds of a point and raises the unemployment rate by a one-third of a percentage.

Fiscal Policy in Current Cycle

During the recession and early in the recovery, the federal government played a key role in helping boost economic activity and offset the drop of the private economy. The \$800 billion stimulus package passed in 2009 was a large help. But by early 2010 Federal stimulus wound down and turned negative as spending was cut. Furthermore, at the beginning of 2013 tax rates increased for upper –income households and the end of the Social Security payroll tax hurt household at the other end of the income spectrum. In contrast to the Federal government, tax and spending policies of the state and local government sector has been a drag on economy activity since the beginning of the recession. Since state and local governments must balance their budgets, falling revenues forced them to cut spending and raise taxes. Overall government spending since mid-2009 has declined by nearly 10% while private spending is up over 12%. In 2013, the federal budget deficit shrank at its fastest pace since the late-1960s, dropping to 3.9% of GDP from 6.8% a year earlier. The story is the same in looking at the aggregate cyclically adjusted budget deficit which increased as expected in the recession years from 2007 to 2009 but has since moved sharply toward a surplus indicating the severity of the fiscal consolidation. A major reason for the shrinking government sector is the decline in overall government investment spending following the end of the stimulus program in 2009. Aggregate government investment is largely spending on infrastructure and at 3.4% of GDP in the first half of 2014; it is at the lowest level as a share of GDP since 1948. In particular, Federal Government investment declined to a 54-year low in the third quarter of 2014 at 0.6% of GDP.

Private Versus Public Employment and Income

As noted above, the private and public sectors have been on different paths since the end of the Great Recession. This is clearly evident in the labor market. Overall government jobs are down by 868,000 since the summer of 2009. Federal employment is down by 132,000 while state and local employment has declined by 746,000 jobs. Government employment is still well below its pre-Great Recession peak. In the same period, private sector employment is up nearly 9 million jobs and is 1.7% above its pre-Recession peak of 115.9 million payroll jobs. As one would expect wage and salaries have also diverged in the two sectors. Real personal income, adjusted for inflation using the PCE deflator, increased at a rate of 3.5 percent between 1960 and 2009 and only 1.6 percent during the recovery. One of the reasons for this slowdown is the decline in public sector wages which are down by 0.7 % since the beginning of the recovery. Thus, weakness in the public sector is holding overall wage growth down in the economy.

Theoretical Framework

Within the economic literature, there is much debate on the effects of government spending on output. Moreover, there is little consensus among economists on this issue. The neoclassical models emphasize the distortional effects of government spending (Ramey 2011). In this view, government spending has little or no positive effect on the economy and it might even be contractionary. The notion that cutting the budget deficit can stimulate the economy is often referred to as the “expansionary fiscal contraction” hypothesis. In contrast, in the new Keynesian view government spending can boost output as they offset factors that prevent the private sector from adjusting to economic shocks (Blanchard 2002, Romer 2010). In this approach, prices and wages are sticky and adjust slowly to economic shocks.

To essentially settle the debate one needs a reliable estimate of the government spending multiplier (Christiano 2009). But there are major challenges in measuring it which explains why economists have different views on the issue. One must consider the type of government spending. Spending on education is likely to have a different impact than for an increase in military spending. Also, there is the issue of timing. Do we measure the multiplier impact for 1 quarter or 5 years? Finally the environment is important. Is the economy in a recession and what is happening with monetary policy?

Empirical Estimates

The traditional approach in the literature to estimate the impact of fiscal policy is to look at the relation between government spending and taxes and GDP growth. We develop a structural vector autoregressive model to estimate this relationship and what would have happened to the economy had fiscal policy followed its typical cyclical path. We use the model to stimulate the economy under different fiscal policy scenarios. Preliminary results from our model simulation are:

Fiscal consolidation has a contraction impact on GDP.

A fiscal contraction equal to 1 % of GDP typically reduces GDP by 0.6 percent over a 2-year period.

If government spending and tax policy followed its normal cyclical path in the current cycle, GDP growth would have been between 0.8 to 1.0% higher in the current recovery.

Under the same scenario, the unemployment rate would have been 0.5% lower.

Thus, without fiscal austerity the current expansion would have looked like a typical post World War II recovery rather than the sluggish recovery that was experienced.

CONCLUSIONS AND FUTURE WORK

Fiscal austerity has a contractionary short-term effect on the economy with lower GDP and higher unemployment. The empirical case for expansionary austerity finds little support in the data. The tepid growth evident in the current recovery was largely due to contractionary government policies especially at the state and local government level. What distinguishes this expansion with other post-World War II recoveries is the extent of the fiscal retrenchment. The weakness in wage growth in the current recovery is largely due to declining government payrolls with private payrolls growing at a modest rate. Had government spending and tax policy followed its normal cyclical path, GDP would have grown at a faster rate and the unemployment rate would have been lower. We would have had a pretty normal recovery. In expanding this study we plan to address some other important issues:

Look at the impact of government spending on state and local economies rather than focusing just on national economy.

Examine the impact of different types of government spending and in particular government investment versus government consumption.

Examine impact of infrastructure and education spending.

Examine the time issue regarding fiscal policy multiplier.
Expand the analysis and look at the impact of austerity for certain European economies.

CARPE - THE STRATEGIC NETWORK OF HIGHER EDUCATION INSTITUTIONS

Juha Kettunen, Turku University of Applied Sciences

ABSTRACT

This paper describes the establishment, activities, and results of the Consortium on Applied Research and Professional Education (CARPE). The general objectives of the higher education institutions in the agreement between the Finnish Ministry of Education and Culture, the maintaining organization, and the universities of applied sciences for the period 2013–2016 include the section on internationalization to guarantee high quality. According to the agreement, the universities of applied sciences form international strategic partnerships to strengthen their focal areas to form joint opportunities for education including double and joint degrees and to intensify collaboration in research and development.

JEL: M1, R1

KEYWORDS: Strategic management, networking, higher education

INTRODUCTION

An education policy of internalization was outlined by the Finnish Ministry of Education (2009). Based on the national outlines, the creation of strategic partnerships was included in the strategic plan of the Turku University of Applied Sciences that was accepted in 2010 (Kettunen, 2010), while the strategic network was established in 2011.

The Dawn of a New Network

The HU University of Applied Sciences Utrecht searched for the best partner for their organization and found the Turku University of Applied Sciences. This constituted the preliminary collaboration between the Dutch and Finnish institutions. The institutions then initiated active discussions, negotiations, and plans. The idea of the strategic network emerged from these discussions in 2008. The heads of the institutions started to look for other partners and began the pioneering process towards creating international strategic partnerships. The criteria of the partnership included that the institutions should be universities of applied sciences, which offer applied research, professional education, regional orientation, and similar fields of education. The promotion of innovation is especially important for the member universities of applied sciences (Kettunen, 2011). Many European institutions were considered and evaluated to achieve the desired result. It was considered reasonable to be selective in the formation of the network in order to achieve high-quality collaboration.

The motivation for the partnership was that Europe represents an important market for export enterprises, which the universities of applied sciences want to support. For example, the Finnish economy is dependent on international export to the extent that export represents nearly 40% of the gross domestic product. Meanwhile, Europe's share of Finland's foreign export is about 55%. Another motivation for the partnership was the European funding for the student and staff exchange and research and development projects. It was decided in the first discussions that the strategic network should not be very large, because trust is essential when experts prepare bids for research and development projects. The general agreement between the institutions creates trust and indicates support for the collaboration. Moreover, higher education

institutions are large entities and it is sometimes difficult to find suitable partners for the projects if the strategic network is very large.

Strategic Network and Its Coverage

Four European universities of applied sciences signed a general agreement to establish CARPE in November 2011. The Manchester Metropolitan University joined the strategic network in 2012 so that the network now includes the following institutions:

HU University of Applied Sciences Utrecht
Turku University of Applied Sciences
Polytechnic University of Valencia
Hamburg University of Applied Sciences
Manchester Metropolitan University

The governance of the CARPE network does not include partnership fees, because each institution pays the administrative, travel, accommodative, and other costs. The student and staff exchange is covered by Erasmus funding. The research and development costs are covered by the external funding of projects. In addition, the funding system of the Finnish central government helps the institutions cover the costs of internationalisation. The CARPE network is open to all partners whether they are higher education institutions, enterprises, or other bodies. They can join the projects of the CARPE universities of applied sciences if they have motivation and objectives that fit the purpose of the project. The network calls CARPE projects all those projects for which there are at least two CARPE partners. It is not reasonable to limit research and development projects to only a few predetermined partners, because the needs of the labour market and working life determine the objectives of the projects.

The mission of CARPE is as follows: “The Consortium of Applied Research and Professional Education is the first strategic alliance of a number of European universities of applied sciences. The partners aim to encourage cooperation in European research programmes and jointly develop educational programmes. They will also mutually exchange students and staff. An important point of departure in this collaboration is the link between education, research, businesses and organisations, thorough which knowledge acquires both social and economic value.”

FAMILY CONTROL AND DIVERSIFICATION: EMPIRICAL EVIDENCE FOR BUSINESS GROUPS

Alejandro Hernández Trasobares, Universidad de Zaragoza
Carmen Galve Górriz, Universidad de Zaragoza

ABSTRACT

The objective of this paper is to analyse the impact of ownership structure on corporate diversification, with reference to large listed familial business groups. The study tests the relationship between family ownership, concentration of ownership, and degree and type of diversification, by analysing ninety-nine listed business group parent companies and establishing business group diversification as the unit of analysis. The results show how family groups present lower degrees of total and unrelated diversification than non-family groups, showing a preference by family groups for related rather than unrelated diversification. There is also a non-linear relationship between concentration of ownership in family groups and degree of diversification (total and unrelated), showing different behaviour in family groups according to shares owned by leading shareholders.

JEL: M140, M200

KEYWORDS: Family Firm, Business Group, Corporate Diversification and Agency Theory

INTRODUCTION

Ownership structure has become particularly important in the last few years in the study of the determinants of diversification, considering both concentration of shares (Lane, Canella and Lubatkin, 1999; Goranova, Alessandri, Brandes and Dharwadkar, 2007) and the nature of the shareholder effectively in control of the firm (Ramaswamy, Li and Veliyath, 2002; Del Brio, De Miguel and Tobar, 2010). In the latter case, given the importance of family firms in the world economies (Zahra, 2005; Moores, 2009) and the characteristics that distinguish them from non-family firms (Chrisman, Chua and Sharma, 2005), family control could be a decisive factor for diversification, although new evidence is still required (Tsai, Kuo and Hung, 2009). The objective of this study is to analyse the impact of family control on degree and type of diversification (related and unrelated) in large Spanish listed family business groups. After identifying family groups in the sample, we first analyse the differences between family and non-family groups in degree and type of diversification, followed by an evaluation of the joint effect of concentration of ownership and familial control on diversification.

LITERATURE REVIEW

Agency Theory recognises the conflict of interests that can arise between shareholders and company management (principal-agent problem), and the different objectives of effectively controlling shareholders and minority shareholders not represented in management bodies (principal-principal) (Amihud and Lev, 1999). In family firms, the involvement of family members in group ownership and management minimises the principal-agent problem, although a conflict of interest can arise between majority (family members) and minority shareholders (unrelated) (Fama and Jensen, 1985), which in both cases can affect the diversification strategies applied. Also, as the family considers financial results and socio-emotional wealth when maximising its utility function (Gomez-Mejia et al., 2007; 2010, 2011), it is more willing to renounce the former in favour of the latter (Gomez-Mejia et al., 2010) and this can also affect diversification strategies. Gomez-Mejia et al. (2010) sustain that diversification represents a loss of socio-emotional

wealth, and the negative impact of diversification on socio-emotional wealth is greater than its positive impact on risk reduction, so family firms diversify less than non-family enterprises.

When considering the relationship between a family business group and type of diversification, more shares in family hands and greater family involvement in management and control reduces the principal-principal agency problem, in this case reducing the use of unrelated diversification. The family will invest in activities that generate less costs and uncertainty, preferring related diversification strategies that preserve more socio-emotional wealth (Gomez-Mejia et al., 2007) and do not harm the social capital based on familial relations. It prefers diversification strategies that have a positive impact on the business group's performance and create more value, in this case related diversification (Bru and Crespi, 2006).

When concentration of family ownership is high, ensuring control of the business group, the family's goal to maintain its socio-emotional wealth and its desire to reduce risk can be compatible. The management team (with family members) will prefer strategies that reduce family risk and satisfy its particular needs, even when this could be in detriment of minority shareholders, generating a principal-principal (type II agency problem), where the wealth or the latter could be expropriated in favour of family members (Corbetta and Salvato, 2004). As ownership increases in family groups, there is a reduction in total degree of diversification as the principal-agent agency problem diminishes; beyond a certain level, however, a principal-principal problem can arise between the family and the other non-family minority shareholders. In this case, the high risk supported by the family and the possibility of expropriation of wealth in favour of family members facilitates the application of diversification strategies, preferring unrelated diversification

METHODOLOGY

This study uses a data panel comprising 99 firms that lead business groups and were listed on the Spanish stock exchange in 2000-2005 (a total of 594 observations). The firms belong to different sector, and none belong to the financial or energy sectors as they have specific legal and accounting standards. The firms that form part of pyramidal groups dependent on listed parents companies were identified by means of the accounts summaries provided by the Spanish National Stock Market Commission (CNMV) website. Diversification in the analysed business groups was defined by quantitative variables. The respective entropy indices were used to measure total, related and unrelated, diversification (Jacquemin and Berry, 1979; Palepu, 1985). A group is considered to be under a family's control when the family (family members) owns the most important shareholding (directly and indirectly) in the listed parent company, and one or several family members occupy key management positions and sit on the Board of Directors (Miller and Le Breton-Miller, 2006). Degree of concentration of ownership is measured as the shares in the hand of the listed parent company's five leading shareholders (% 5 SHARE) (Kang, 1999).

The following control variables are considered: i) size of listed parent company (LN SIZE), measured by total parent company assets expressed as logarithms; ii) age (LN AGE), measured as the logarithm of the difference between two thousand and the year of establishment of the listed parent company; iii) indebtedness (DEBT), measured as the ratio between the total debt and the total assets of the listed parent company; iv) capital intensity (CAPIT INT), measured as the ratio between total material and immaterial fixed assets and number of employees of listed parent company; v) investment in intangible assets (INTANG), representing the listed parent company's investment in new technologies and measured by the ratio between tangible and total assets; vi) difference between the firm's economic returns and the economic returns for the year of the firms in the sample (ER-ER_YEAR), which enables us to analyse degree of managerial discretion in decision-making; vii) structural change in parent company (SCD), a dummy variable that is 1 when there has been a structural change in the listed parent company and 0 otherwise We first perform a descriptive study showing both the means differences in the model's variables according to

the group's family ownership. Secondly, to estimate the impact of family ownership and concentration of ownership on the group's degree and type of diversification, we use ordinary least squares (OLS).

RESULTS AND DISCUSSIONS

Table 1 analyses the difference in means of the main study variables according to family control of business group. When analysing diversification, family business groups present a lower degree of total and unrelated diversification, with no differences in degree of related diversification. Regarding the model's other variables, listed parent companies controlled by family members show greater concentration of ownership, are less intensive in productive capital, are smaller and have been involved in a smaller number of mergers and takeovers. In relation to mean dispersion in "return on firm investment relative to mean return on investment of sample firms", there are differences between family and non-family parent companies, with less managerial discretionality in the former.

Table 1: Differences in Means of Principal Study Variables According to Family Ownership of Business Group and Correlations Between Study Variables

	MEAN T												
	TD	RD	UR	FAM	%5 SHARE	LN SIZE	LN AGE	DEBT	INTANG	ER-ER_YEAR	CAPIT INT	SCD	
<i>FAM</i>	0,506	0,158	0,348	50,50%	65,96%	11,46	3,59	0,37	0,025	-0,006	4,56	18%	
<i>NO FAM</i>	0,73	0,185	0,545	49,50%	48,36%	12,45	3,66	0,39	0,034	0,006	4,84	27%	
Student	***	NS	***	---	***	***	NS	NS	NS	**	*	**	

* $p < .10$. ** $p < .05$. *** $p < .01$ NS: non-significant; TD (total diversification), RD (related diversification), UR (unrelated diversification), FAM (family business), %5 SHARE (ownership concentration), LN SIZE (Size), LN AGE (age), DEBT (Debt), INTANG (intangible assets) ER-ER_YEAR (difference between the firm's economic returns and the economic returns for the year of the firms in the sample), CAPIT INT (capital intensity) and SCD (structural change in parent company).

Table 2 shows the results of the ordinary least squares and panel data models showing the impact of family ownership of the business group on degree of total, related and unrelated diversification conclusion. The first significant observation on Table 2 is the zero impact of family ownership on degree of total diversification. Family and non-family groups present the same behaviour. Regarding degree of related and unrelated diversification, Table 2 shows how family ownership has a negative impact on degree of the latter (see model 3); in other words, family groups diversify less in unrelated activities than non-family groups. However, there are no differences between family and non-family groups when it comes to diversifying in related activities (see model 2). Therefore, family business groups show a greater preference for diversification in activities related to their core business. The results obtained for the control variables show the existence of similarities between degree of total and unrelated diversification; the size of the group's parent company and involvement in merger/takeover processes has a positive impact on diversification, while greater investment in intangible assets, greater capital intensity and greater difference between the parent company's returns and annual returns reduces the degree of total and unrelated diversification

* $p < .10$. ** $p < .05$. *** $p < .01$ NS: non-significant; TD (total diversification), RD (related diversification), UR (unrelated diversification), FAM (family business), %5 SHARE (ownership concentration), LN SIZE (Size), LN AGE (age), DEBT (Debt), INTAGN (intangible assets) ER-ER_YEAR (difference between the firm's economic returns and the economic returns for the year of the firms in the sample), CAPIT INT (capital intensity) and SCD (structural change in parent company).

Table 3 analyses the possible non-linear relationship between degree of diversification and concentration of ownership in family groups. The model thus contemplates the percentage of shares owned by the five leading shareholders when the group is under family control (% 5 SHARE * FAM) and its value squared.

Table 3 shows a non-linear relationship between concentration of ownership in family groups and degree of diversification. Initially, increased concentration of ownership of family groups has a negative impact, although after a certain level of family control, increases in family ownership favour diversification. With regards to type of diversification, Table 3 confirms the null impact of family control on related diversification, and the existence of a non-linear relationship between concentration of family ownership and degree of unrelated diversification (as occurs with degree of total diversification). In other words, the relationship between concentration of ownership and degree of diversification is greater for unrelated than for related diversification. In relation to the other control variables, the results are consistent with those obtained before.

CONCLUSION

The results confirm the existence of a relationship between ownership structure variables, degree and type of diversification. More specifically, family groups present lower degrees of unrelated diversification than non-family enterprises, showing a preference for involvement in business related to their core activities. If we consider concentration of ownership in family groups, there is a non-linear relationship with degree of diversification, which decreases (total and unrelated) as concentration of ownership grows; however, from a certain level, increases in concentration of ownership in family groups increase degree of diversification (total and unrelated) This research makes several contributions. Firstly, diversification is measured considering business groups, facilitating the identification of related and unrelated activities and more appropriately showing the group's strategy. Secondly, the study provides new evidence of the impact of ownership structure of business groups with listed parent companies on degree and type of diversification, together with the existence of a non-linear relationship in family groups between degree of diversification and concentration of ownership. Finally, the study contributes to the literature by analysing Spain, which has a legal system based on civil law, with a weaker institutional and regulatory framework in terms of protection of minority shareholders.

The research, however, does have a series of limitations. The article compares family and non-family groups, while it could be more appropriate to consider the last owner of non-family businesses, considering whether they are controlled by banks, non-national companies, investment funds, the State, etc., as different objectives can have different effects on diversification strategies. Also, the results are valid for business groups in which the parent company is listed, and cannot be generalised to family groups or firms that are smaller and/or unlisted. Another possible line of research is therefore to establish the relationship between family ownership, concentration of ownership and diversification for unlisted business groups

CHRISTIANITY AND PAN-KOREAN NATIONALISM: SOUTH KOREA'S ROLE AS MODEL IN THE GLOBAL WAR ON TERROR

Benedict E. DeDominicis, The Catholic University of Korea

ABSTRACT

The authorities in South Korea have demonstrated greater success in the competition with Pyongyang in generating support in great power polities. The sources of this influence include economic vested interests with South Korea being the fourth largest economy in Asia. Another set of sources includes the large vested interests in US military and diplomatic circles from nearly 70 years of alliance with South Korea during and after the Cold War. South Korean leverage also includes the sympathetic legacy of proselytizing Western and particularly American religious cultural organizations in Korean religiosity and society. Pan-Vietnamese nationalism's rejection of Catholic community self-identity stemmed from the latter's association with France, the imperial occupier. In Korea, American and Soviet Cold War intense, competitive interference supplanted Japanese imperialism. Christianity therefore did not readily become associated with imperial control of Korea by a single external power. Advocacy of South Korea as a development model in soft power competition for influence against pan-Arab and pan-Islamic militants in the Middle East is basically flawed. It lacks an adequate conceptualization of the relationship of religious identity to national identity and the quest for national self-determination.

INTRODUCTION

South Korea's hosting of the November 2010 G20 summit was an opportunity to proclaim South Korea's developed country status again to the world (Oliver 2009). This development occurred within the setting of opportunities created during and after the Cold War within the context of US hegemony (Kennedy 2010). Justification of foreign policy through use of religious symbols is generally not acceptable in today's global political context. It is associated with imperialism and the consequent resistance it generates. According to former US Secretary of State Madeleine Albright, "Diplomats in my era were taught not to invite trouble, and no subject seemed more inherently treacherous than religion" (Farr 2010). The broad range of human rights ideals instead provide the set of symbolic rhetorical resources which today's leaders of expanding states use to justify international influence extension (Axtmann 2007: 536, 42, 45). National self-determination is one such ideal along with civil and political rights. The latter includes freedom of religion as a component of a vigorous civil society. The existence of religious diversity in South Korea facilitates American support for South Korea to the extent that the US establishment authorities see South Korea as a model. The US promotes this model of economic and political development to the rest of Asia and the world (Wolfowitz 2010).

Ethnic lobby groups have a long history of engagement in US politics, and the Korean lobby is no exception (Tiron 2009, Fackler 2014). Relatively cohesive, politically active South Korean Presbyterian Protestants have been observed in American politics (Pew Research 2008). South Korean Christian evangelicals have played a prominent role in leading this political participation (e.g. Worldwide Kingdom/Revival 2004). As one December 2008 Pew Forum US post-election participant, Prof. John Green, noted,

[...] it's worth just spending a moment talking about the different pieces of the structure of faith-based politics in the United States, a structure that's been in operation for more than 20 years. [...] Religious affiliation – the religious communities to which people belong – is a very important part of the structure of faith-based politics. As in the past, religious affiliation is very closely linked to ethnicity and race. It is worth spending a moment on this linkage in the form of “ethno-religious” groups.”

Ethno-religious groups have been important in American politics from the beginning of the republic and some examples are well-known, such as Irish Catholics, Scottish Presbyterians and German Jews. Some of those groups are still important today, but new groups have come on the scene. Thus we have a new version of an old story, with new ethno-religious groups such as Mexican Catholics, *Korean Presbyterians* [emphasis BD] and Arab Muslims, where religious affiliation, ethnicity and race are very closely tied together. This diaspora reinforces South Korea's soft power leverage towards Washington. South Korea with its diverse set of formal and informal religious self-identities coexisting in peaceful democracy stands in marked contrast to other regional actors. These include the totalitarian dictatorship in North Korea and its authoritarian patron in the Peoples' Republic of China (Xu and Bajoria 2014).

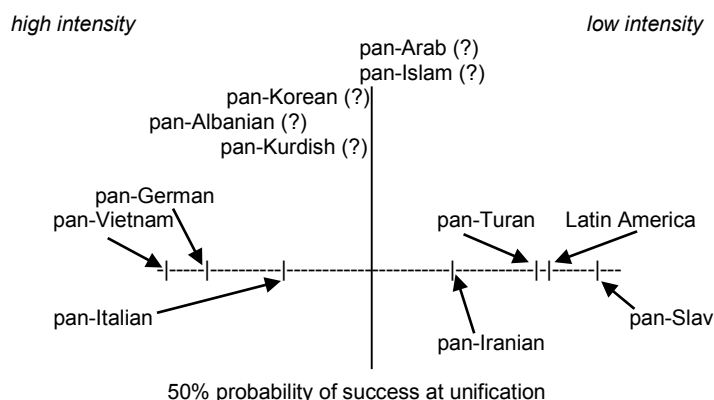

The relationship of religion to national identity is a question of the importance of religious community self-identification as a component of a broader national community identity. Protestant Congregationalist Christian community identity is a historically powerful component of American national identity (Lipset 1997, esp. 9). External actors that can appeal to this strong component of American national identity can evoke favorable latent, intense American nationalistic predispositions.

Nationalism and Pan-Movements

Pan-movements may be fruitfully approached from a comparative regional perspective for the study of nationalism (Behar 2005: 590-95, 605-7). Cottam and Cottam outline the political dynamics of the pan-movement. It associates with a national community that two or more states divide. A larger community that meets the criteria for a terminal community consists of the territorial community, or a major component of the territorial community, of at least two states. A serious political movement that tends towards the unification of two or more states with concentrations of a single national community is one major variant of this pattern. The territorial community would likely then become the terminal community for what would be a new nation state if this movement leads to a broader unity in the form of a larger state (2001, 22). Historically, the pan-Germanic and pan-Italian movements were able to draw upon a sufficiently large section of the population. It had an identity attachment of the requisite intensity in order to be politically successful in creating a nation state that was larger (Ibid. 22). Creating this state typically requires overcoming great power interests in preserving the regional political status quo. The success of Vietnamese nationalism in overcoming great power resistance illustrates the potential power capability inherent in some nationalist social movements.

Pan-Slavism, pan-Turanism and pan-Iranianism are historical examples of other movements that have failed to mobilize identity at the necessary intensity to produce a larger state (Ibid.). Pan-movements receiving media and scholarly attention include pan-Albanian sentiments (De Renzy Channer 2012: 1-24). The challenge of pan-Kurdish political sentiments is again in the media (Gunter 2014: 23-24). Pan-Islam sentiments in the Greater Middle East continue to evoke contention and debate (Lawrence 2011: 134-35). Pan-Arabism and pan-Islamism have attracted sufficient support to have the potential to succeed in at least some of their aspirations (Cottam and Cottam 2001, 22). These two movements, however, are very different.

Figure 1: Community Pan-National Self-Identification

Pan-movements are nationalist movements that seek to unify what are perceived as the politically partitioned territorial components of the nation into one nation state. Relatively successful historical cases include the respective unification movements among the Germans and the Italians. Vietnam was partitioned during the Cold War. The intensity of pan-Vietnamese nationalism to mobilize Vietnamese power capabilities with assistance from Cold War external allies over decades eventually overcame resistance. Pan-Korean nationalism has so far not been successful, but the end of the Cold War has lessened external support for maintaining the partition. Pan-Arab and pan-Islam are politically significant social movements disrupting the de jure and de facto territorial partitions and ethno-sectarian polarizations of the Greater Middle East today.

Cottam and Cottam note that as with most pan-movements, pan-Arabism constitutes an effort to unite elements of a single ethnic community. It would serve as the national community base for a nation state that is much larger. Pan-Islamism, in one of its major manifestations, is rather an effort to unite a universal community of believers in Islam. It is to serve as the national community base for a vastly larger nation state. This national community would be multi-ethnic, multiracial, and multi-sectarian. Both a pan-Arab and a pan-Islamic state would have nationalistic behavior characterizing it; both publics would display a predisposition towards nationalistic behavior (2001, 23). The pan-Islamic nation state, however, would almost certainly display a polarization on the grounds of community identity (Baker 2013). The pan-Islamic national community and the other community identities would behave nationalistically. The community interests that they would be attempting to serve through influencing state policy would be contradictory. Contradictory community interests would characterize the larger Arab nation state as well, but the polarization within it would be comparatively less politically prominent (e.g. BBC Monitoring 2014).

Pan-Koreanism, Pan-Arabism and Us Soft Power

South Korea has been proclaimed a model of success for development within the framework of American Cold War containment and competition with the USSR. South Korea continues to be touted as a model of what the US can accomplish in nation building if it shows sufficient will and determination to do so. The source of success of South Korea in competition with its northern rival lies in the failure of the Communist regime to generate the necessary power instruments to do so. This weakness lies in the inherent contradictions within the Communist block in which North Korea was a client state. They also lie in the development of the sources of soft power support that South Korea has to influence the US foreign policy making process. These sources include a shared Christian identity, including an introduction to Protestant Christianity by way of American missionaries arriving in the late nineteenth century. Following the 1910-45 Japanese occupation and US-Soviet partition in 1945, Christianity has grown in South Korea to constitute at least one-third of the population. Following large refugee movements during the Korean War, conversions to Christianity skyrocketed along with the rapid phase of South Korean industrialization. Simultaneously, the North Korean economic and political model faded in its attractive power while China and eventually the USSR liberalized. Korean Christianity has benefited from its association with the US

while Korean public opinion views the US as providing real solutions to Korea's historic poverty, exploitation and incapacity.

Among the Arab public, the external division of the Arab communities continues in which the US intervenes in its attempts to reinforce it. US Cold War concerns regarding Third World radicalism being sympathetic to a perceived, expansionist Moscow was the primary US motivation. As in Korea, Cold War vested interests over decades of engagement have become themselves a motive for US continued Middle East intervention and US reactions to threats to them.

US and Soviet intervention and frustration of regional aspirations for national self-determination contributed to the rise of political Islam as a mass movement for social and political change. US opposition to militant political Islam constitutes a critical weakness in soft power-based tactical efforts that the US employs to maintain its influence in the region. The Long War is likely to last for generations while the US strives to maintain the territorial status quo in upper Mesopotamia and the Levant (Borer and Berger 2007: 457-58, 61-62). The collapse of the North Korean regime and the reunification of Korea, in contrast, is much more likely to be comparatively soon.

CORPORATE SOCIAL RESPONSIBILITY IN THE US BANKING INDUSTRY

Firuz Madrakhimova, University of North America

ABSTRACT

This proposed qualitative research will examine the effect of corporate social responsibility and financial performance in the banking industry. The selection of qualitative method for the proposed study is supported by Creswell's (2009) approach to qualitative inquiry.

KEYWORDS: Business, Corporate Social Responsibility, Stakeholder

INTRUDUCTION

There has been an ongoing debate at the beginning of the industrial age, debate has raged over whether or not companies carry a responsibility solely to make profit, or whether they have a responsibility to the society from which they generate a profit (Freeman, 1984). Today, social responsible banking has become a well-established notion in the financial services industry (Parsons, 1964). The banking industry is considered the engine of an economy. It provides necessity in nature to the society and whose policies and decisions can largely affect public interest (Miles and Huberman, 1994). Banks manage financial risks, monitor borrowers and organize payment system (Greenbaum & Thakor, 2007), which helps to improve market efficiency. Numerous studies have assessed how banks affect the economy. Levine (2004) and Scholtens (2009) suggest that the banking system is playing an important role in economics and sustainable development. The issue of corporate social responsibility had been addressed during recent several decades by the scholars from all over the world. It's specifics in banks as they are active players on the CSR field attracted particular interest of the researchers. So such authors as Ararat (2006), Islam (2008), and Adelopo (2012) paid attention to some regional financial markets and their specifics of the corporate social responsibility. On the other hand such scholars as Yiannaki (2009), Arbak (2013), addressed their research to some particular issues concerning implementation and functioning of the corporate social responsibility in banking.

"One of the definitions used in managerial literature is that quality is the extent to which the product meets the demands; another is customer satisfaction" (Drucker, 1999).

Corporate social responsibility - it is a very important part of banking, because society's expectations of the bank, as well as from any other large organization, is much broader than just the need to pay taxes, support staff salaries and income to shareholders. The Company expects to find solutions of social problems.

Purpose of the Study

The purpose of this qualitative study is to explore the phenomenon of corporate social responsibility in the United States banking industry. Also, this study will permit the researcher to understand if and how participants in the US banking industry describe their experience with corporate social responsibility.

This study aims to:

Understand how participants describe the role corporate social responsibility plays in the banking industry.

Understand how participants describe the alignment of a bank's core business principles with corporate social responsibility.

Significance of the Study

The increasing demand for organizations to demonstrate corporate social responsibility and to create positive social change is evident across all industries, including banking. Previous studies have focused on Return on Investment, stakeholder demands, environmental impacts and even legal implications associated with corporate social responsibility. Unfortunately, most of the past research was conducted in areas other than banking. Additionally, while all of these areas of study are certainly important to better understand corporate social responsibility as whole, arguably the most important issue of social impact has been barely researched within the general literature and virtually nonexistent in the banking literature. This study may provide a significant missing link in the complete understanding of corporate social responsibility and offer meaningful insight to practitioners in both banking and non-banking related industries.

Research Question

The following research questions will guide this proposed qualitative research study. The research questions will ask the following:

What is the role of corporate social responsibility in the banking industry?

How does the implementation of corporate social responsibility practices affect governance of the banking industry?

How does the implementation of corporate social responsibility practices affect employees?

How does the implementation of corporate social responsibility practices affect banking consumers?

LITERATURE REVIEW

This chapter describes the literature pertaining to corporate social responsibility. It also describes the sources of literature and how it's organized. Since the late 80's of the XX century in many Western countries, the companies received broad support and development of the philosophy of corporate social responsibility. Evolution of a concept of corporate social responsibility passed certain stages. The starting point can be considered Bowen's, "Social Responsible Businessman," which was published in 1953. It reflected the determination of the meaning of the concept, as well as opportunities for further detailed study of the corporate social responsibility. Subsequent were studies of corporate social responsibility presented by Davis (1960), McGuire (1963), where they specified the concept and content of social responsibility. Currently promising direction is the study of politics as an extension of the theory of corporate social responsibility stakeholders. Following the publication of a study by Freeman in 1984, this theory began used widely to analyze and explain the relationship of the company and society.

Author defines stakeholders as any group or individual who can affect or are affected by the achievement of organizational goals. Similar definition of stakeholders can be found in future studies of A. Carroll (1999). As noted above, the concept of corporate social responsibility formed in the whole world recently, about 60 years ago. Prior to this period, there were different standards and regulations in the areas of corporate governance, corporate ethics, and relationships with competitors, responsibilities towards the society and the country. Social policy rules and standards have not been developed at all because there was use of the "random" approach. However, from the late 60s - 70s leading U.S. and European companies have started to come to an understanding of the need to unite different elements of corporate policies related to the relationship of the company with the environment, and to the development of a single integrated approach to interaction with society. Such a policy, on the one hand would have to be associated with the philosophy of the company, its marketing strategy, and it should meet the expectations of society.

METHODOLOGY

The purpose of this qualitative study is to determine the methodology of the research and the ways how data will be collected. Within the world of business, the main “responsibility” for corporations has historically been to make money and increase shareholder value. In other words, corporate financial responsibility has been the sole bottom line driving force. However, in the last decade, a movement defining broader corporate responsibilities— for the environment, for local communities, for working conditions, and for ethical practices—has gathered momentum and taken hold. This new driving force is known as corporate social responsibility. This qualitative study will use a phenomenological tradition (Creswell, 1998) to understand the research question. "Qualitative research is an inquiry process of understanding based on distinct methodological traditions of inquiry that explore a social or human problem. The research builds complex, holistic pictures, analyzes words, reports detailed views of informants, and conducted the study in natural setting" (Creswell, 1998).

Denzin and Lincoln (1994) provided a generic definition of qualitative research, that is, "Qualitative research is multi-method in focus, involving an interpretive, naturalist approach to its subject matter." The 'multi-method in focus' is described as "the combination of multiple methods, empirical materials, perspectives and observers in a single study is best understood, then as a strategy that adds rigor, breadth, and depth to any investigation" (Flick, 1992). Furthermore, Creswell (1998) gave his definition of qualitative research focusing on the methodological nature, the complexity of the end product and its nature of the naturalistic inquiry; Creswell (1998) categories five traditions of qualitative research; Biography explores the life of an individual; Phenomenology aims to understand the essence of experiences about a phenomenon; Grounded Theory focuses on developing a theory grounded in data from the field; Ethnography describes and interprets a cultural and social group and a Case Study focuses on developing an in-depth analysis of a single case or multiple cases.

The phenomenological inquiry is particularly appropriate to address meanings and perspectives of research participants. The major concern of phenomenological analysis is to understand "how the everyday, inter-subjective world is constituted" (Schwandt, 2000) from the participants' perspective. The basic philosophical assumption underlying this inquiry has most often been illustrated by Husserl's (1962) statements - "we can only know what we experience." The essence is the central underlying meaning of the experience shared within the different lived experiences. There has been important phenomenological research to be conducted to understand the experience of banks about corporate social responsibility and to discover the essence of other type's corporate social responsibility experience. Instruments use more flexible, iterative style of eliciting and categorizing responses to questions.

Creswell (2005) argued that researchers designing qualitative studies need clear criteria in mind and need to provide a rationale for their decisions. Qualitative researcher need to examine the typology of 16 strategies for purposeful sampling advanced by Miles and Huberman (1994). This proposed research use maximum variation, criterion and convenience. According to Creswell, "it is essential that all participants experience the phenomenon being studies in phenomenological study". Criterion sampling works well when all individuals studied represent people who have experienced the phenomenon. All individuals meet the criterion" Criterion sampling involves selecting cases that meet some predetermined criterion of importance (Patton, 2001, p. 238). This study will use criterion sampling. In qualitative research, the inquirer purposefully selects individuals and sites that can provide the necessary information. Purposeful sampling means that researchers intentionally select participants who have experience with the central phenomenon or the key concept being explored (Creswell, 2005). A number of purposeful sampling strategies are available, each with a different purpose. One of the more popular is maximal variation sampling, in which individuals are chosen who hold different perspectives on the central phenomenon. The criteria for maximizing differences depends on the study, but it might be race, gender, level of schooling,

or any number of factors that would differentiate participants (Creswell, 2005). The central idea is that if participants are purposefully chosen to be different in the first place, then their views will reflect this difference and provide a good qualitative study. Another approach is to use extreme case sampling of individuals who provide unusual, troublesome, or enlightened cases. In contrast, a researcher might use homogeneous sampling of individuals who have membership in a subgroup with distinctive characteristics (Creswell, 2005).

This study will employ both criterion and purposeful sampling strategies. The samples selected for this study will be in Northern Virginia area and researcher will contact bank employees at all levels to conduct this research, in order to determine perspective of employees at a different levels. The purpose of this section is to collect appropriate and valid data for the research. Researcher will use interviews and documents for data collection. During the interviews researcher conduct an unstructured, open-ended interview and take interview notes; conduct a focus group interview audiotape the interview, and transcribe the interview. There are a variety of methods of data collection in qualitative research, including observations, textual or visual analysis and interviews. However, the most common methods used are interviews and focus groups.

During the data collection researcher use documentations where researcher keeps a journal during the research study; analyze public documents; and etc. One advantage of qualitative methods in exploratory research is that use of open-ended questions, and probing gives participants the opportunity to respond in their own words, rather than forcing them to choose from fixed responses, as quantitative methods do. Open-ended questions have the ability to evoke responses that are: meaningful and culturally salient to the participant; unanticipated by the researcher and rich and explanatory in nature. Another advantage of qualitative methods is that they allow the researcher the flexibility to probe initial participant responses – that is, to ask why or how. The researcher must listen carefully to what participants say, engage with them according to their individual personalities and styles, and use “probes” to encourage them to elaborate on their answers. Sample interview questions from interview protocol will include:

Is corporate social responsibility necessary in banking? In your opinion, what role does corporate responsibility play in the banking industry?

What are advantages and disadvantages of corporate social responsibility in the banking industry?
What is the role of corporate social responsibility in the corporate governance of banks?

According to Creswell (2005), in quantitative research, reliability, validity, generalizability and objectivity are the criteria. In qualitative study, Rossman and Rallis (1998) make the judgment in terms of the following. The truth value of the research: to judge the truth value depends on "how adequately multiple understandings are presented and whether they ring true, i.e. to have face validity. According to Creswell (1998), five strategies are suggested to obtain this truthfulness: 1. Gather data over a period of time or intensively rather than in a one-shot manner; 2. Share the interpretations of the emerging findings with participants; 3. Design the study as participatory or action research from beginning to end; 4. Triangulate, i.e. to draw from several data sources, methods, investigators, or theories to strengthen the robustness of your work and 5. Contextualize the findings to the specific setting and participants, i.e. the conclusions are bounded by time and space. The researcher will use all of above-mentioned strategies to obtain truthfulness of the proposed study.

Depending on their philosophical perspectives, some qualitative researchers reject the framework of validity that is commonly accepted in more quantitative research in the social sciences. They reject the basic realist assumption that there is a reality external to our perception of it. Consequently, it doesn't make sense to be concerned with the "truth" or "falsity" of an observation with respect to an external reality (which is a primary concern of validity). These qualitative researchers argue for different standards for judging the

quality of research. For instance, Lincoln and Guba (1985) proposed four criteria for judging the soundness of qualitative research and explicitly offered these as an alternative to more traditional quantitatively-oriented criteria. They felt that their four criteria better reflected the underlying assumptions involved in much qualitative research. Their proposed criteria and the "analogous" quantitative criteria include credibility, transferability, dependability and conformability.

Transferability refers to the degree to which the results of qualitative research can be generalized or transferred to other contexts or settings. From a qualitative perspective transferability is primarily the responsibility of the one doing the generalizing. The qualitative researcher can enhance transferability by doing a thorough job of describing the research context and the assumptions that were central to the research. According to Creswell (1998), the person who wishes to "transfer" the results to a different context is responsible for making the judgment. Therefore, this purposed study aims to have a transferable research. Attention to the judgments about the validity of research-generated knowledge claims is integral to all social science research. During the past several decades, knowledge development has been split into two communities: conventional researchers and reformist researchers. Narrative research is positioned within the reformist community. The two communities use different kinds of data and employ different analytic processes. In both communities, researchers develop arguments to convince readers of the validity of their knowledge claims. Both need to respond to threats to validity inherent in their designs. The threats particular to narrative research relate to two areas: the differences in people's experienced meaning and the stories they tell about this meaning and the connections between storied texts and the interpretations of those texts. The narrative for this study will be organized in a series of themes that emerged from the data analysis and coding process.

HOW STICKY ARE DIVIDENDS? COMPARING PAYOUT POLICY BEFORE AND AFTER THE FINANCIAL CRISIS

Thomas O. Miller, West Chester University of Pennsylvania

ABSTRACT

This work-in-progress research analyzes dividend stickiness by examining managers' decisions whether to cut dividends when facing cash flow shortfalls. I present two hypotheses regarding this decision. One, which I label "tradition", suggests that managers are looking back at dividend history, and view cutting as a last resort. The other suggests managers are forward looking and base their decisions primarily on expectations about future performance. Analysis of maintaining and cutting groups with poor cash flows lend support to both hypotheses, but firms that maintained their dividend see significant increases in sales growth, and in some cases cash flow, the following year, indicating that managers are forward looking. Firm leverage is particularly important for determining whether a firm cuts its dividend under cash shortfalls. Since a financial crisis often represents an opportunity for managers to go against "tradition," a post-2007 sample was created to see if decisions to cut dividends differed dramatically from pre-crisis behavior.

JEL: D22, G34, G35

KEYWORDS: Dividends, Financial Crisis, Payout Policy, Stickiness

INTRODUCTION

Since Lintner (1956) it has been well documented that dividend payouts to shareholders are smoothed, with last period's payout having the largest impact on this period's. Lintner's findings along Miller and Rock's (1985) documentation of a negative reaction to dividend cuts have led to the interpretation of dividends as sticky. Once a firm starts paying a level of dividends it becomes very reluctant to cut, meaning they are essentially "stuck" there. One explanation for stickiness is that it reflects tradition. Managers may believe that if their firm has been paying dividends for an extended period that those dividends are part of the identity and culture of the firm. Brav, Graham, Harvey, and Michaely (2005) report in their survey of managers that most consider maintaining dividends of equal importance to determining investment levels, which is in stark contrast to Miller and Modigliani's (1961) dividend irrelevancy hypothesis. Skinner (2008) building on Brav et. al (2005) also suggests that firms pay dividends out of historical obligation. This represents a view that stickiness signals the past, firms that have always paid dividends will strive to continue that policy, and perhaps incur serious costs to do so, all to avoid going against long standing tradition.

An alternative explanation is that firms use dividends as a signal of their future expectations. Benartzi, Michaely, Thaler (1997) examine whether dividend changes signal the future or the past. They find that while increases do not lead to future increases in cash flow, firms that raise dividend payouts are much less likely to experience declines in cash flow in future periods. Cash flows fluctuate even for the most stable firms, but a fluctuating dividend is less attractive to income seeking investors. To address this disconnect between cash flow stability and investor preferences firms maintain dividends to retain consistency in shareholder payouts, a phenomenon Lintner refers to as dividend "smoothing." Under this model short term shocks should not affect dividend payouts, unless they also indicate changes to a firm's future earning potential.

In this paper I focus on the dividend decisions of firms facing cash flow short falls, both before and after the 2008 financial crisis. Following severe negative shocks to cash flow and/or earnings dividend paying firms are faced with a decision between two presumably costly alternatives. The firm can continue to pay dividends at current levels, either by drawing down internal cash reserves or engaging in external financing, or cut dividends giving a negative signal to the market and risk reduction in share price and other negative reactions from investors. Leary and Michaely (2011) note that dividend paying stocks are often held by income-seeking institutional investors very concerned about payout levels.

LITERATURE REVIEW

An important concept to the framework of this paper is the costs of external financing that could determine a firm's willingness to raise funds in order to maintain its dividend. As described by Myers and Majluf (1984) firms would be likely to forgo increasing dividends to build financial "slack" to ensure optimal future investment. If firms pay dividends and maintain them through difficult times, they must bear the costs of external financing to do so. Therefore firms with high costs of external financing should then be more likely to cut dividends if short term cash flows cannot support them. These costs of external financing can be measured by firm leverage and, more directly, credit ratings for those firms where data is available.

Related to this issue is Easterbrook (1984) which provides two agency cost explanations for why firms pay dividends. The first is that it is costly to monitor management and that paying dividends reduces the amount of cash at managers' disposal. The second rationale is with reduced cash, managers must now go to the capital markets to finance new ventures. The markets can then monitor managers by only financing value creating projects. In this situation firms, would simultaneously raise cash from external sources while also paying dividends. Because of stickiness, firms using this practice may transition from raising cash while paying dividends to raising cash specially to pay dividends. This concept of dividend financing is explored further in a later section of the paper.

A more recent paper studying dividend stickiness is Aivazian, Booth, and Cleary (2006), which focuses on the type of debt a firm has and how these different debt types affect the firm's dividend decision. Aivazian et al find that firms with bank debt exhibit a strong correlation between dividends and current earnings, which essentially equates to non-sticky dividends. Conversely, they also find that firms with publicly traded debt, and thus a credit rating, are more likely to engage in dividend smoothing, as predicted by the Lintner model. The paper also finds empirically that the same fundamental factors that influence paying a dividend also influence access to public debt, particularly size and asset tangibility. Aivazian et al indicates a clear link between a firm's outside financing options and its dividend behavior. Grullon, Michaely, and Swaminathan (2002) build on Benartzi, Michaely, and Thaler (1997) and argue that dividend increases are a sign of firm maturity.

They find that earnings do not increase following dividend increases, but, rather, increase leading up to the dividend change. They do find, however, that earnings are much less likely to decrease following a dividend increase, suggesting the real information in dividend changes is that previous increases in earnings are permanent. Grullon, Michaely, and Swaminathan use these results to suggest that dividend increases convey information about a firm's discount rate. They find empirical support that as firms age and become less risky and offer less return they will increase dividend payments. This provides support for the "forward looking" hypothesis to be discussed in the next sections. This suggests that when firms notice a change in their future prospects, in this case decreased risk, which will impact the firm's dividend policy.

HYPOTHESES

The first hypothesis I consider for how firms make their dividend decision is the “tradition” hypothesis. The tradition hypothesis is based on the work of Brav et al (2005) and Skinner (2008). Brav et. al find in a survey of top management (CEO and CFOs) that many managers view dividends as a “burden” and were felt significant pressure to maintain them. When questioned further many said if they were to run a company from inception they would never introduce a dividend, instead distributing cash through repurchases. Skinner (2008) builds on this result by observing that a vast majority of the dividends in the market are paid by a small number of firms (approx. 300) with long dividend histories. He asserts that these firms are continuing to pay dividends simply because they always have, essentially dividends are a tradition for these firms. This hypothesis is also consistent with a line of behavior research that suggests dividends have become a social norm (Frankfurter and Lane, 1992). The rationale is that dividends once served a purpose in mitigating information asymmetry problems, but over the course of time, however, dividend paying evolved into a custom that is difficult to question and hard to resist. Baskin (1988) reviews the historical development of corporations in the United States and the UK and observes that investor pressure turned dividend paying into a normative behavior that is difficult to evade.

The “tradition” hypothesis says that firms are looking backward when deciding to maintain or cut dividends this period. This hypothesis predicts that the longer a firm’s history of maintaining dividends, the greater the likelihood it will continue to maintain them. This hypothesis is consistent with Lintner’s model, as last period’s dividend is the primary factor influencing this period’s. The “tradition” hypothesis also implies that dividend cuts would be a method of last resort. Firms have little incentive to cut dividends until they absolutely must. This leads to a prediction that dividend policy choices (to cut or not) should have little effect on future performance. The difficulty in testing this hypothesis is that a “tradition” is a nebulous concept. Surely thirty years of paying a dividend would constitute a tradition, but what about ten or five? Is a firm with twenty years of maintaining dividends any less set in its policy than a firm with thirty five years of maintaining? Providing clarity in this area will be an important step in testing this hypothesis.

If the “tradition” hypothesis is backward looking, then its alternative is forward looking. The “forward looking” hypothesis predicts that future firm prospects are the primary influence on a firm’s dividend policy. Grullon, Michaely, and Swaminathan (2002) provide some of the strongest support for this argument. They show a firm’s understanding of its future discount rate is the driving factor behind dividend increases. The difficulty in testing this hypothesis is determining the best way to measure future firm prospects. Easterbrook (1984) suggests that the costs of and access to external financing would be a good way to capture such prospects.

This hypothesis is also consistent with Lintner (1956). Dividend smoothing is a firm’s attempt to separate earnings volatility from payout volatility. Under this model a choice to cut dividends would indicate a change in the future outlook of the company. The “forward looking” hypothesis suggests that maintaining dividends signals that while current circumstances for the firm may be poor; managers’ outlook on the future of the company has not changed. A prediction of the forward looking hypothesis is that following poor performance firms that maintain dividends should improve, returning to established levels.

RESULTS AND FURTHER RESEARCH

For a sample of firms from 1987-2007 analysis of differences in means across all firm years where companies maintain versus cut their dividend give indications that both hypotheses could be valid. Cutting firms have poor, and often negative, growth rates on key financial measures suggesting that only extreme financial stress motivates firms to cut their dividends. With the documented adverse market reaction to dividend cuts found in Miller and Rock (1986) it makes little sense for firms doing well to reduce payouts, so the poor performance of cutting firms logically follows.

Next new sub-samples were created for firms under various conditions of financial stress. Again, differences in mean tests were conducted across maintaining and cutting firms. After using a number of different measures to account for financial stress firms with both negative income and operating cash flow and firms with cash flows less than previous dividends are made the focus of further analysis. Somewhat surprising is that 45.7% of firms with negative income and cash flow continue to not only pay dividends, but maintain their previous dividend levels. Analysis of summary statistics shows the key variables that appear different between maintaining and cutting firms are asset growth and leverage. The next step in this research is to repeat this process using a new data set for 2008-2013 to see if the financial crisis and subsequent “great recession” impacted dividend policy decisions.

CONCLUSION

Overall the results reported in this paper lend support to both the “tradition” and “forward looking” hypothesis. Since the “tradition” hypothesis is possibly rooted in a behavior social norm, it is extremely difficult to produce a direct and clean test on the hypothesis. A direct test of the “forward looking” hypothesis shows that in three out of four samples sales growth is greater for firms who maintained their dividend. Although I cannot dispute that dividend history plays an important part in managers’ dividend decisions, results seem to indicate that the most recent history is far more important than any longstanding traditions.

NIGERIA AS AN EMERGING MARKET: INVESTMENT HUB FOR VENTURE CAPITAL AND PRIVATE EQUITY FUNDS

Omopeju B. Afanu, Markibook Group

ABSTRACT

This paper would elaborate on the untapped investment opportunities in certain key developmental and economic sectors in Nigeria that have the potential to raise the Nigerian economy, from its current status as the largest economy of Africa, to one of the fastest growing and largest global economies of the 21st Century within the next 5 years; ranked amongst the big 5 economies. These investments would also guarantee higher than normal returns for the investors with the focus being Venture Capital and Private Equity Funds based on their zero interest and long term repayment plans whilst looking at avenues to secure and protect investors.

JEL: G10; G11

KEYWORDS: Private-Equity, Venture Capital, Investments Funds, Emerging Markets, Return on Investments

INTRODUCTION

Nigeria has the largest economy in Africa with the size of its economy as at 2013 estimated at \$521.8 billion with a GDP per capita of about \$3005.51 with South Africa coming second with a GDP estimated at \$350.6 and a GDP per capita of about \$6,617.91 (World Bank Data, 2014). In consideration of the size of the Nigerian economy, the volume of investment from venture capital and private equity funds is not commensurate with the expectations and forecasts compared to other African countries. Nigeria currently has a higher return on investment compared to other parts of the world taking into consideration its population size, democratic stability, improved legal and business environment and framework. A recent survey by RisCura Fundamentals (2013) revealed that the majority of private equity managers believe that Africa is now the most attractive investment emerging-market region in the world. Ultimately, demonstrating that broad exposure to the African growth story cannot be fully accessed without considering private equity. While private equity has its own shortcomings; it has the great advantage of being able to access companies outside of the narrow confines of listed markets (Ord, 2013). Nigeria does not require soft loans and grant by the industrial nations to improve its economy rather it requires direct investment from venture capital and private equity funds that would improve and cater to its long term financial needs. These investors would be partners in the business and would ensure the success of the business to guarantee the projected return on investment and revenue forecast.

Sectors of Focus for Venture Capital and Private Equity Investments

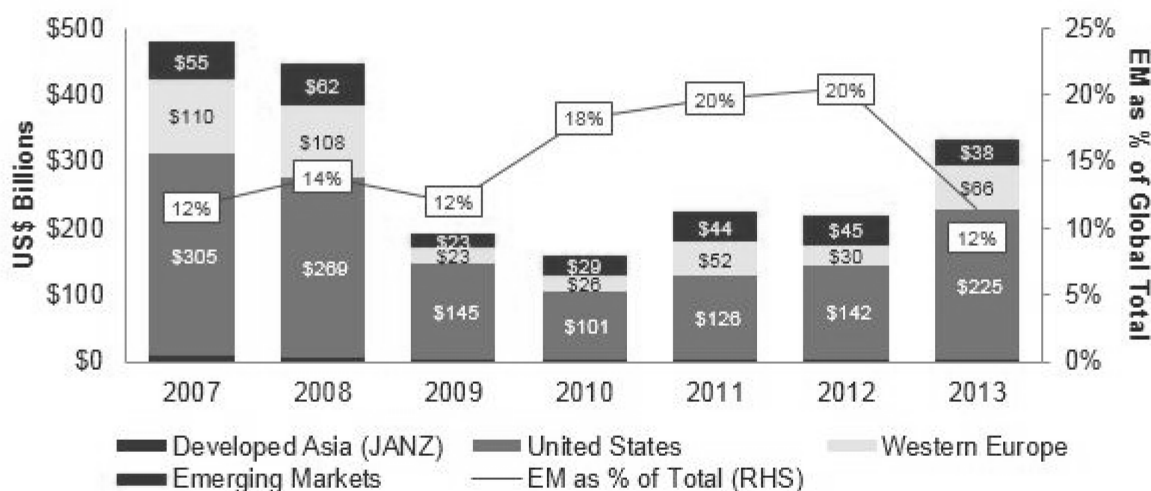

Real Estate
Renewable Energy
Infrastructure development
Oil and Gas
Mining
Agriculture

JUSTIFICATION/LITERATURE REVIEW

This paper would demonstrate the various investment sectors requiring funds from venture capital and private equity companies/fund managers with minimal risk to their investments by elucidating the steps that should be taken prior to investment and throughout the duration of the investment. Presently of the over 200 venture capital and private equity firms in Africa, Nigeria can only account for about 10 of these firms. This figure is insufficient in comparison to the size of the Nigerian economy which justifies the need to grow this model of business financing and structuring through the introduction of new and experienced Venture Capital and Private Equity players in the targeted sectors (James B., 2014).

The current venture capital and private equity funds investment into the Nigerian economy has less than \$2billion Assets under Management (AUM) as against other emerging markets like Brazil and South Africa having 100+ PE managers with \$34Billion AUM and 86+ PE managers with \$11.6Billion AUM respectively (James B., 2014). Global private equity fundraising in 2013 amounted to \$333bn, a 51 per cent increase on the total funds raised in 2012 and the largest amount raised since 2008 (see Exhibit 1). Of that \$333bn, \$38bn – or 11.5 per cent – was dedicated for emerging markets; and of that \$38bn, \$1.2bn (approximately 3 per cent) was cordoned off for sub-Saharan Africa. (Casey, 2014)

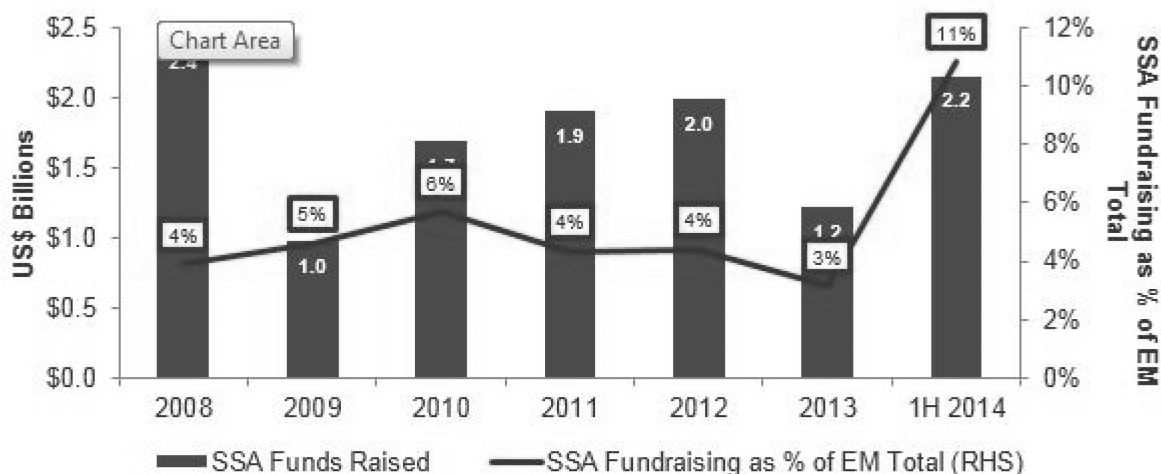

Exhibit 1: Private Equity Capital Raised by Geography, 2007-13 (US\$B; EM as % of Global Total)

Source: EMPEA.

Since 2008, sub-Saharan Africa has accounted for anywhere between 3 per cent and 6 per cent of total capital committed to emerging market funds, though that figure jumped starkly to 10.8 per cent in the first half of this year on the back of fundraising successes from Carlyle, Amethis and Helios, which together raised 65 per cent of the \$2.2bn total (see Exhibit 2) (Casey, 2014).

Exhibit 2: Sub-Saharan Africa Fundraising, 2008-1H 14 (US\$B; % of EM Total)

Source: EMPEA.

According to surveys of global institutional investors from EMPEA and RisCura, the biggest challenge LPs confront when evaluating private equity commitments to Africa is the limited number of established fund managers. At first glance this might seem hard to believe, as Africa is seemingly abuzz with private equity activity. According to EMPEA data, 144 unique private equity fund managers have executed transactions in Africa since 2008. Moreover, between 2009 and the first half of 2014, 76 Africa-focused fund managers have closed on capital for investment on the continent (Casey, 2014).

The Global Competitiveness Index 2013-2014 of the World Economic Forum ranked Nigeria 120/144 economies while South Africa is ranked 53rd, overtaking Brazil to place second among the BRICS. Nigeria benefits from its relatively large market size (32nd), which has the potential for significant economies of scale and is an important factor for attracting investment. Nigeria also benefits from an efficient labour market, and the financial market has been recovering gradually from the 2009 crisis. Yet efforts need to be taken to diversify its economy into the non-oil sector and increase long-term competitiveness. Institutions remain weak (129th) with insufficiently protected property rights, high corruption, and undue influence. The security situation in Nigeria which showed a downwards trend starting in the previous year to the current 142nd position. Additionally, Nigeria must continue to upgrade its infrastructure (135th) as well as improve health and primary education (146th). Furthermore, the country is not harnessing the latest technologies for productivity enhancements, as demonstrated by its low rates of ICT penetration (WEF, 2014).

While South Africa does well on measures of the quality of its institutions (41st), including intellectual property protection (18th), property rights (20th), and in the efficiency of the legal framework in challenging and settling disputes (13th and 12th, respectively). The high accountability of its private institutions (2nd) further supports the institutional framework. South Africa's financial market development remains impressive at 3rd place. The country also has an efficient market for goods and services (28th), and it does reasonably well in more complex areas such as business sophistication (35th) and innovation (39th) and security continues to be a major area of concern for doing business (at 109th). Building a skilled labour force and creating sufficient employment also present considerable challenges. The health of the workforce is ranked 133rd out of 148 economies—the result of high rates of communicable diseases and poor health indicators more generally. The quality of the educational system is very poor (146th), with low primary and tertiary enrolment rates. Labor market efficiency is poor (116th), hiring and firing practices are extremely

rigid (147th), companies cannot set wages flexibly (144th), and significant tensions in labour-employer relations exist (148th). Raising educational standards and making the labour market more efficient will thus be critical in view of the country's high unemployment rate of over 20%, with the rate of youth unemployment estimated at close to 50%. (WEF, 2013)

Analysis of the Potential Economic Investment

Nigeria is ranked 26th in the world, the largest economy in the Africa in terms of GDP and is on track to become one of the 20 largest economies in the world by 2020 but presently on the Global Competitiveness Index (WEF 2014) Nigeria is not ranked among the top 10 economies in Africa. However, Nigeria is currently ranked amongst the next eleven emerging economies of the world and currently classified as one the N-11 and more specifically as MINTs economies one of the four economies with the highest potential to join the league of the fastest growing and largest economies of the 21st Century, BRICS. The following key sectors have the potential to further raise the GDP and economy of Nigeria either directly or indirectly; these sectors under review are either untapped or are yet to realise their full potential, with guaranteed high return on investments if exploited:

Real Estate

With a population of over 160 million people Nigeria has an enormous housing deficit which was evidenced most recently as a call for application for 10,000 mortgages was oversubscribed by 600% with over 66,000 applicants applying for a federal government mortgage loan scheme available for only 10,000 applicants. The real estate sector can only adequately be developed utilizing Foreign Direct Investments from Private Equity of Venture Capital Funds, these funds would be utilized as bridging funds for commencement of development projects prior to the draw down on the Federal Mortgage Bank funds, thereby guaranteeing the required return on investment. On the other hand, for the higher risk takers real estate development projects can be developed using investment funds with a higher return on investment through off-plan sales or sales upon completion to interested buyers; the return on investment in this instance may be slower but much higher than the returns from the bridging funds.

Renewable Energy

Renewable energy in Nigeria is still in its developmental stage, the only source of renewable energy in the country currently being exploited is hydro-power and biomass; wind and solar energy have only been deployed in minimal amounts while solar energy in Nigeria is majorly used in urban areas for street lighting, and in rural areas it is used for irrigation project and water pumping. The Government of Nigeria is exploring renewable energy resources as potentials in enhancing its power generation and electricity supply by generating power from the readily available renewable sources most especially, Solar power which Nigeria has in abundance. Other sources of renewable energy being explored include Biomass/Landfill gas, Hydro power and Natural gas flared from its various refineries. In 2007, Nigeria set a target to generate 7% of its 2025 energy need from renewable energy sources with solar and hydro as the major priority. Minister of State for Power, Mohammed Wakil, stated that the Federal Government of Nigeria had concluded plans to launch a National Policy on Renewable Energy and Energy Efficiency to boost power supply in the country. "The policy will harness and provide focal point for all national efforts on renewable energy. This is in line with the commitment of the ECOWAS President, Kadré Desiré Ouedraogo, as well as the need for us as a nation, to diversify our sources of power supply. The Minister further stated that the government was working on a vision to generate about 30,000 megawatts from renewable sources to augment supply from the national grid.

Infrastructure Development

The dearth on infrastructure cannot be over emphasized in Nigeria with great potential for immense growth. Less than 20% of Nigerian roads are fully paved with the majority of the roads in poor motorable conditions thereby establishing the need for alternative means of transportation with the focus directed towards the light rail mode of transportation. In Nigeria, the most popular and established mode of transportation is by road with minimal rail service thereby necessitating the need for heavy duty trucks and machineries to ply the roads as the only available means of transporting both imported and locally manufactured goods. The effect of this on the roads cannot be overemphasized as the roads were not built to withstand the pressure and weight from these cargos and heavy duty trucks. As a step towards remedying the deficit, most recently, the Nigerian Government awarded a light rail project valued at over \$60 billion dollars. The financing for these projects can only be sourced from foreign funds as the interest rates in Nigeria are unfavorable when compared against single digits long term foreign funds. There are several other infrastructural development projects such as roads but the execution of these projects would require long term low interest funds.

Oil and Gas: There are various investment opportunities available in the Nigeria Oil and Gas sector which currently accounts for an estimated 14% of the Nigerian GDP. These investments can cut across the upstream and downstream sectors of the industry. The upstream sector offers potential in crude oil exploration and oil and gas production. The downstream sector offers a very wide range of opportunities covering Production and Marketing of Liquefied Natural Gas, Refining of crude oil, establishment of processing plants and industries for the production of petroleum end products e.g. Mineral oil, petroleum jelly, grease, bituminous/damp proof materials, asphalt etc.

Mining: Nigeria is richly endowed with solid minerals which are underexploited such as coal, lignite, coke, tin, gold, iron ore, kaolin, columbite, tantalite, gemstones, and uranium. Nigeria is estimated to have over thirteen billion barrels of bitumen oil. The greatest challenge generally facing the mining industry of Nigeria is lack of sophisticated and modern technology required to mine these resources in commercial quantities. Most of the mining done is carried out on small-scale bases by local families with minimal large-scale investments. Most recently, Nigeria commenced exploration of the potential in the gemstone market with the government requesting for investors in this sectors that have the experience and finance required to mine and process the gemstones using cutting edge technology to ensure that the production quality and process meets international standard.

Agriculture: The main stay of Nigerian economy was agriculture, prior to the discovery of black gold “oil”, with over 91 million hectares of arable land for farming. Agriculture currently accounts for about 26.8% of the GDP and two-thirds of employment in Nigeria. Irrespective of the neglect to the agricultural sector Nigeria, still has a very rich potential in agricultural commodities with some of the highest breeds of agricultural products in the region such as cocoa, rubber, cassava, maize and groundnut. The Agricultural sector is suffering from setbacks caused by the utilization of antiquated farming methods and overage and obsolete varieties of trees. Poultry production has dropped by about 50%, Cattle breeding has dropped drastically with most supply predominantly dependent on imports from neighbouring countries to meet the very high demand.

IN CONCLUSION

Potential Benefits For Investors

Presently Nigerian banks offer loans (debt finance) at an interest rate of between 18-25% with limited option for long term funding and very stringent lending terms (Nigeria is ranked 138/148 on Ease of Access to Loans by World Economic Forum- Global Competitiveness Index 2013) this makes it necessary for Nigerian Government, Companies, Financial organisations or Entrepreneurs to look outside of the country

for developmental funds. There is a great need for introduction of long term foreign funds at single digit interest rates or preferably venture capital and private equity funds which require no interest and no collateral for execution of capital projects, these investments are guaranteed high turnover investments with considerably higher than normal margins for investors. With the present democratic stability in the country which has spanned over 15 years Nigeria can boast of a level playing field to develop robust venture capital and private equity firms to finance innovative and high growth businesses with a guaranteed 200% on investment.

Nigerian National Private Equity Initiative by Henshaw Capital Partners; Nigeria needs an introduction of 10-15 PE fund managers per year to reach a 100+ PE fund managers with \$20billion AUM (James B. 2014).

Sub-Saharan Africa has been one of the top three markets in EMPEA's LP Surveys over the last two years. However, the volume of capital commitments is yet to match the feverish degree of sentiment (Casey 2014).

It is generally believed that certain factors are responsible for the slow pace of Foreign Direct Investment in Africa and more particularly in Nigeria, these factors include security risk, poor government policies, lack of transparent legal framework for establishing companies by Foreign investors, fluctuations in foreign exchange rates.

To improve the success ratio of Foreign Direct Investment and increase the influx of venture capital and private equity investment funds into Nigerian economy, there is a need for a greater and more in-depth partnership and collaboration between the Nigerian Government and Commercial departments of the various Embassies and Consulates to increase the sensitization and awareness of the investment opportunities that abound in Nigeria. Organisation of Trade Missions, Economic summits and Conferences targeted towards potential investors are required to serve as a point of education for foreign investors on the processes of setting up a business in Nigeria; making available lists of potential credible investment partners that have been properly vetted by both Governments' agencies responsible for trade and commerce; and finally potential investors need to carry out a more extensive research on Nigeria to familiarise themselves with the business, political and economic environment as some of the international media coverage do not adequately paint the real picture of what is actually obtainable in Nigeria especially in relation to security issues. These forums would also help both Governments' identify the challenges being faced by potential investors with solutions proffered targeted towards securing the investors and mitigating and reducing exposure to fraudulent companies and partners with the goal of improving the Nigerian Foreign Direct Investment risk management process for potential investors.

Ultimately for Nigeria to be categorised in the league of the global emerging markets in the next 5 years there must be a marked shift in the funds supply index with a goal to increase the assets under management by 1000% from \$2 billion to \$20 billion with over 100 PE fund managers.

With an injection of the required Private Equity and Venture Capital funds into the sectors identified in this paper; Nigeria would have realised its potential as one of the most prominent Next Eleven (N-11) (Jim O'Neill 2007), and probably included in the list of the five BRICS economies, the fastest growing and largest economies of the 21st Century, to form the acronym BRINCS (Brazil, Russia, India, Nigeria, China and South Africa)

WHY DO SO MANY PEOPLE ENJOY PLAYING GAME?

Joonhuei Bae, Kyungpook University
Dongmo Koo, Kyungpook University

ABSTRACT

It has been long time that the popularity of online games has drastically been growing in the world. Although little research on online games or video games have studied, their benefits have been studied recently. One of the benefits is to improve and manage emotions, which can be the motivations to play online game as well. In the context of cognitive evaluation theory, the motivation in sports, education, and leisure domains comes from intrinsic motivation. Activities foster greater intrinsic motivation so as to meet the need such as competence and autonomy.

Massively Multiplayer Onlines (MMO) games multiple players interacting within a virtual environment using their characters. After choosing a role, users interact with other virtual characters, share experience, build a relationship, and collect virtual assets. Immersion of MMO can make the players escape real life problems. Social interaction is an important part of online game play. Online game provided players opportunities to interact and connect in virtual worlds regardless of locations.

Online game as ludic experience arouse a great deal of emotions such as pleasure and excitement. Online games are voluntary activities and have the specific rules within virtual world. Based on the uses and gratifications theory, online games are to improve players' mood and enhance their emotional state. That is, individuals who experience pain in real life want to pursue pleasure out of it and they thus, choose playing online game as stimulus that could make their emotion change. Flow is also a kind of positive emotional experience. Replayability and playability related to enjoyability are important factors to make them success in the online game market.

The two factors describe how well the player base receives the game. Replayability is similar with intention for future play but the same with it and a quantifiable measure to the enjoyability of a game whereas playability is a binary measure of whether a game can be enjoyed or not. After players experience something for the first time, often they want to like to experience is reapplyable.

According to Juul's definition, a video games is a rule-based formal system with a variable and quantifiable outcome, where different outcomes are assigned different values, the player exerts effort in order to influence the outcome, the player feels attached to the outcome, and the consequences of the activity are optional and negotiable. Our study focuses feeling attachment of online games.

The prior researches have been studied based on the theory of reasoned action and the technology acceptance model. They, however, have a limitation to approach the emotion during game play. Thus, do we research the reason why a lot of people play online games in the premise of hedonism. And then we demonstrate what kind of emotion online could be aroused while playing online games and the relationship between the replayability of the emotions. We measure and compare the differences of emotions between pre-experiment and post-experiment to find out our research objectives from the online game players volunteering in Daegu, Korea.

A NEW METHOD WITH A FAMA-FRENCH 3-FACTOR MODEL FOR COMPARING ECONOMETRIC SOFTWARE GENERATION ON US STOCK MARKET

Yuxiang Zhang, Nankai University
Liuling Li, Nankai University

ABSTRACT

We estimate the influence of three waves of new econometric software (emerged in 1965, 1970 and 1985) on the US Stock Market considering the EGARCH-type volatility in Nelson (1991), the non-Normal error of SSAEPD in Zhu and Zinde-Walsh (2009), and the 3-factor model of Fama and French (1993). Data of Fama-French 25 portfolios are divided into 6 samples by sectioning the time span of 1926-2011. Method of Maximum Likelihood Estimation is used to estimate this model and Likelihood Ratio test (LR) is used to test parameter restrictions. The residuals are checked by Kolmogorov-Smirnov test (KS). Empirical results show the Market factor, the Size factor and the Book-to-market factor are alive among 1965, 1970 and 1985 wave of econometric software. And the estimated results of 1985 wave of econometric software are compared with those of 1965 and 1970 econometric software generations, which shows both the similarity and difference those events have on the stock market.

KEYWORDS: Econometric Software Generation, Fama-French 3-Factor Model, Standardized Standard AEPD, EGARCH.

INTRODUCTION

the development of econometric software in the last 50 years spans the professional careers of almost all working economists. At each step along the road, the forefront of stock market prediction and other models are constructed using those applications of econometric software. However, tracing back the history of econometrics as research tools, the economists are among the first to utilize the computer. Although “born” in the 1940s and used first by economists during the early 1950s in Klein (1960), as a general phenomenon, the programmable electronic computer becomes an economic research tool only during the 1960s. The involvement of econometric software has a lot of ups and downs in the last 50 years.

Renfro (2004a) issues his evaluation of computer software for econometric applications and provides a detailed compendium of existing econometric software packages in Renfro (2004b). Ooms and Doornik (2006) study the short history of econometric software development and suggest that there are three waves of different software. The first wave of new product in the 1960s can be connected with the availability of FORTRAN. The second wave in the 1970s corresponds with the appearance of computer terminal interfaces. The third wave in the beginning of the 1980s is connected with the development of the first microcomputers and IBM-PCs. Among them, no specific econometric software could be chosen from the time span of 50 years and compared regarding their separate impacts on the quantitative economics. Econometric programs have different advantages and a specific group of users choose them for the everlasting impact as new versions are released to catch up with new trends. In this paper, we follow the claim that three waves of new product have the most distinctive effect on the history of economics. The corresponding time points we select as event are: 1965, 1970 and 1985.

Event Chain Methodology is an uncertainty modeling and schedule network analysis technique that is focused on identifying and managing events and event chains that affect project schedules. In 1969, Fama, Fisher, Jensen and Roll introduce the event chain methodology. The traditional event study is a two-step procedure: 1) estimate model parameters with pre-event data; 2) calculate abnormal returns and their

respective t-statistics for the “event window” (see Karafiath (1988)). Bina and Vo (2007) apply this event-study to explore the possible influences of OPEC decisions on output. Zhang et.al. (2009) use an EMD-based event analysis to estimate the impacts of events on crude oil price volatility.

This paper extends the literature on several fronts. First, the research here provides a most explainable model to study the event of each econometric software generation. The Fama-French 3-Factor Model is based on the 3-factor model of Fama-French (1993), the EGARCH-type volatility of Nelson (1991) and the non-Normal error of SSAEPD in Zhu and Zinde-Walsh (2009). Moreover, it's the only known study to have computed the generation of econometric software's influence on the stock market. This paper is one in a series of papers. The new model is first proposed by Yang (2013). Bian (2014) also used this methodology to study the impacts of oil crisis on the stock market. We study the changes of coefficients before and after those three waves. The reason why we choose this new model is that it shares the same sensitivity-to-market pattern as that in the 3-Factor Model of Fama and French (1993) and has better in-sample fit (see Yang (2013)).

In this paper, we will test two hypotheses. Are the 3 factors in Fama-French (1993) still alive if EGARCH-type volatility in Nelson (1991) and non-Normal error of SSAEPD in Zhu and Zinde-Walsh (2009) are considered during pre- or post- econometric product waves? Can we find significant differences of these three waves of econometric software? To answer these questions, data from the US stock market (1926-2014) are divided into 6 data sample. We analyze the samples with the MATLAB program. Likelihood Ratio test (LR) is used for testing parameter restrictions. Kolmogorov- Smirnov test (KS) is used for model diagnostics. Empirical results show the Market factor and the Size factor are alive but the Book-to-market factor is not alive before and after 1965, 1970 and 1985 waves of econometric software. The study of 1965, 1970 and 1985 waves yield remarkably similar conclusions. During the period after both statistical technique proposals, most of the 25 portfolios have smaller β_1 , β_2 and β_3 , indicating they become less sensitive to the market. This paper is organized as follows. The next section is the methodology. We then introduce the way we get our data and calculate the empirical results. The final section concludes.

METHODOLOGY

Based on the 3-factor model in Fama and French (1993), the EGARCH-type volatility in Nelson (1991) and the non-Normal error of SSAEPD in Zhu and Zinde-Walsh (2009), a new model is proposed by Yang (2013) which replenishes the study of Fama-French 3-factor with the property such as fat-tailedness and skewness. For simplicity, this model is denoted as FF-SSAEPD-EGARCH(r, s), and the math formulas are,

$$R_t - R_{ft} = \beta_0 + \beta_1(R_{mt} - R_{ft}) + \beta_2 SMB_t + \beta_3 HML_t + u_t \quad t = 1, 2, \dots, T, \quad (1)$$

$$u_t = \sigma_t z_t, z_t \sim SSAEPD(\alpha, p_1, p_1),$$

$$\ln(\sigma_t^2) = a + \sum_{i=1}^r g(z_{t-i}) + \sum_{j=1}^s b_j \ln(\sigma_{t-j}^2),$$

$$\begin{aligned} g(z_{t-i}) &= c_i z_{t-i} + d_i [|z_{t-i}| - E(|z_{t-i}|)] \\ &= \begin{cases} (c_i + d_i)z_{t-i} - d_i E(|z_{t-i}|), & \text{if } z_t \geq 0 \\ (c_i - d_i)z_{t-i} - d_i E(|z_{t-i}|), & \text{else.} \end{cases} \end{aligned} \quad (2)$$

Here, R_t , R_{ft} and R_{mt} are the rates of return for stock portfolio, the risk-free rate and the return rate of the market (at time t), respectively. SMB_t Stands for small size (i.e, market capitalization) minus big size (i.e., market capitalization) and HML_t stands for high Book-to-market ratio minus low Book-to-market ratio. The conditional standard deviation is σ_t , i.e., volatility. The error term z_t is distributed as the Standardized Standard Asymmetric Exponential Power Distribution (SSAEPD) proposed by Zhu and Zinde-Walsh (2009).

Empirical Analysis

Data

We study three waves of econometric software: 1965 wave, 1970 wave and 1985 wave. Data for analyzing these waves are obtained from the market return of Fama-French 25 portfolios, which are downloaded from the French's Data Library. The downloaded data are daily returns of 25 portfolios from January 26, 1926 to July 31, 2014. However, we follow Robert (2004) and split the dataset (January, 1926- July, 2014.) into 2 sub datasets in order to compare the influence. We set pre-1965 econometric period as Sample 1 (January, 1926- October, 1965) and post-1965 econometric period as Sample 2 (November 1965 to July, 2014), define pre-1970 econometric period as Sample 3 (January, 1926- October 1970) and post-1970 econometric period as Sample 4 (November 1970 to July, 2014) and state pre-1985 econometric period as Sample 5 (January 1926- October 1985) and post-1985 econometric period as Sample 6 (November 1985- July 2014). We check those that through descriptive statistics of these samples using MATLAB. For each observation, the skewness of the stock portfolio is not 0 and the kurtosis is more than 3. The P-value of Jarque-Bera test for each portfolio is 0, which is smaller than 5% significance level. Hence, we conclude that the asset returns in 6 samples do not follow Normal distribution.

Estimation Results

The estimation results for the spited effect of three waves of econometric products based on FF-SSAEPD-EGARCH model with data from Fama-French 25 portfolios are calculated by MATLAB program. Most β_0 are close to 0 and β_1 are around 1. And the skewness parameter α are all approximately equal to 0.5, which means that after considering the 3 factors in the model and EGARCH-type volatility, the error terms of the data show no obvious skewness. The left tail parameter p_1 and right tail parameter p_2 of all the 25 portfolios are approach to 2, and nearly all returns have different values of p_1 and p_2 , which means the split period of US stock market has the asymmetric kurtosis. To test the significance of estimated coefficients for the 6 sample of econometric period, Likelihood Ratio test (LR) is applied. The null hypotheses for the 11 coefficients are as follows.

$H_0: \beta_i = 0$, for parameters in the Fama-French 3 factor model,
 $H_0: a = 0, H_0: b = 0, H_0: c = 0, H_0: d = 0$, for EGARCH Equations,
 $H_0: \alpha = 0.5, H_0: p_1 = 2, H_0: p_2 = 2$, for SSAEPD error.

Pre- and Post- 1965 Econometric Period

The estimation results for the new model in Sample 1 (pre-1965 econometric period) are calculated and analyzed. According to the results, all estimates of β_1 are statistically significant under 5% significance level. Most estimates of β_3 are statistically significant. Only estimates of β_2 in the High Book-to-market portfolios are statistically significant. Hence, we conclude the Market factor and the Book-to-market factor are alive but the Size factor is not alive in the data of pre-1965 econometric period. And the skewness parameter α are all approximately equal to 0.5, which means that after considering the 3 factors and EGARCH-type volatility, the error terms of the data show no obvious skewness. The left tail parameter p_1 and right tail parameter p_2 of all the 25 portfolios are close to 2. Similar results are also documented in Sample 2.

Pre- and Post- 1970 Econometric Period

The estimation results for the new model in Sample 3 (pre- 1970 econometric technique) are analyzed. The Fama-French 3 factors are still alive. All estimates of β_1 are statistically significant under 5% significance level. Most estimates of β_2 are statistically significant. Only estimates of β_3 in the Low Book-to-market portfolios are statistically significant. Hence, we conclude the Market factor and the Size factor are alive but the Book-to-market factor is not alive in the data of pre-1970 econometric period. And the skewness

parameter α are all approximately equal to 0.5, which means that after considering the 3 factors and EGARCH-type volatility, the error terms of the data show no obvious skewness. The left tail parameter p_1 and right tail parameter p_2 of all the 25 portfolios are close to 2. Similar results are also documented in Sample 4.

Pre- and Post- 1985 Econometric Period

The estimation results for the new model in Sample 5 (pre- 1985 econometric technique) and Sample 6 (post- 1985 econometric technique) are similar to the results of Sample 3 and Sample 4.

Comparison of 1965, 1970 And 1985 Econometric Software

To compare 1965, 1970 and 1985 Econometric Software, we plot the estimates of β_1 , β_2 and β_3 in Figure 1. We discover that the coefficients in these three generations of econometric software present similar patterns. During the period after both Econometric Generation, most of the 25 portfolios have smaller β_1 , β_2 and β_3 . The reasons, however, for changes of these three coefficients require further explanation.

Figure 2: Comparison of B_1 Values Before and after 1965, 1970 and 1985 Waves of New Products

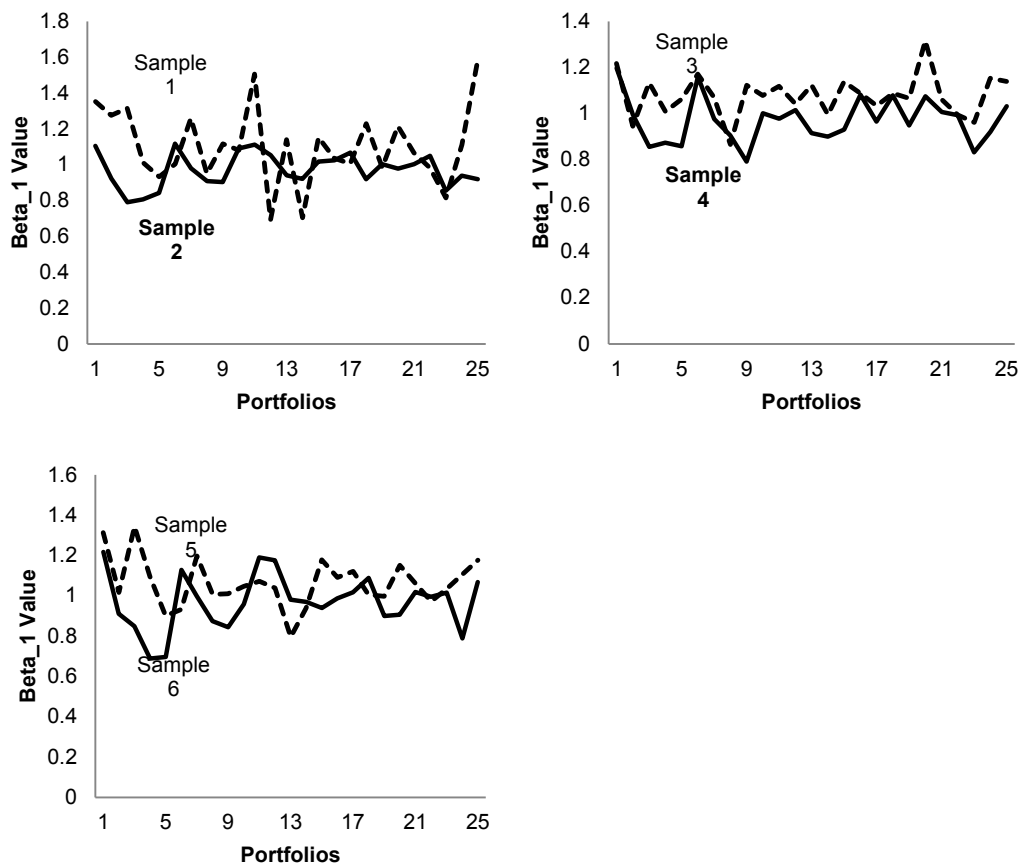

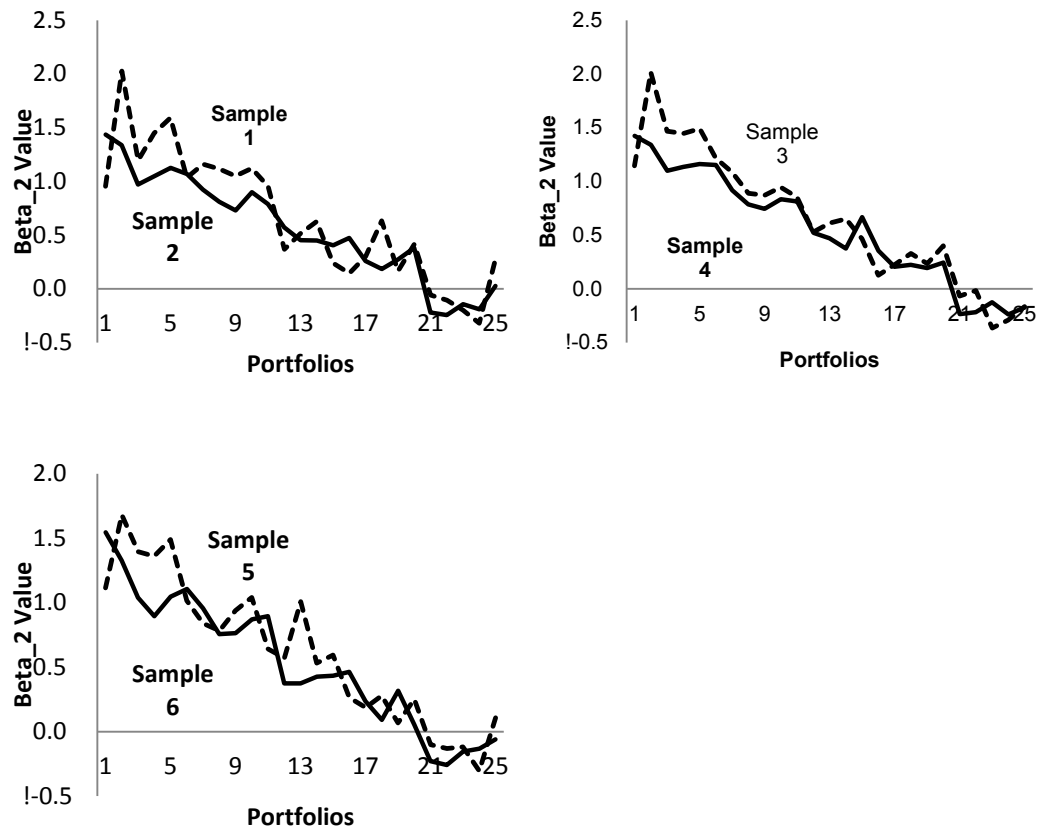

Figure 3: Comparison of B_2 Values Before and after 1965, 1970 and 1985 Waves of New Products

Residual Check

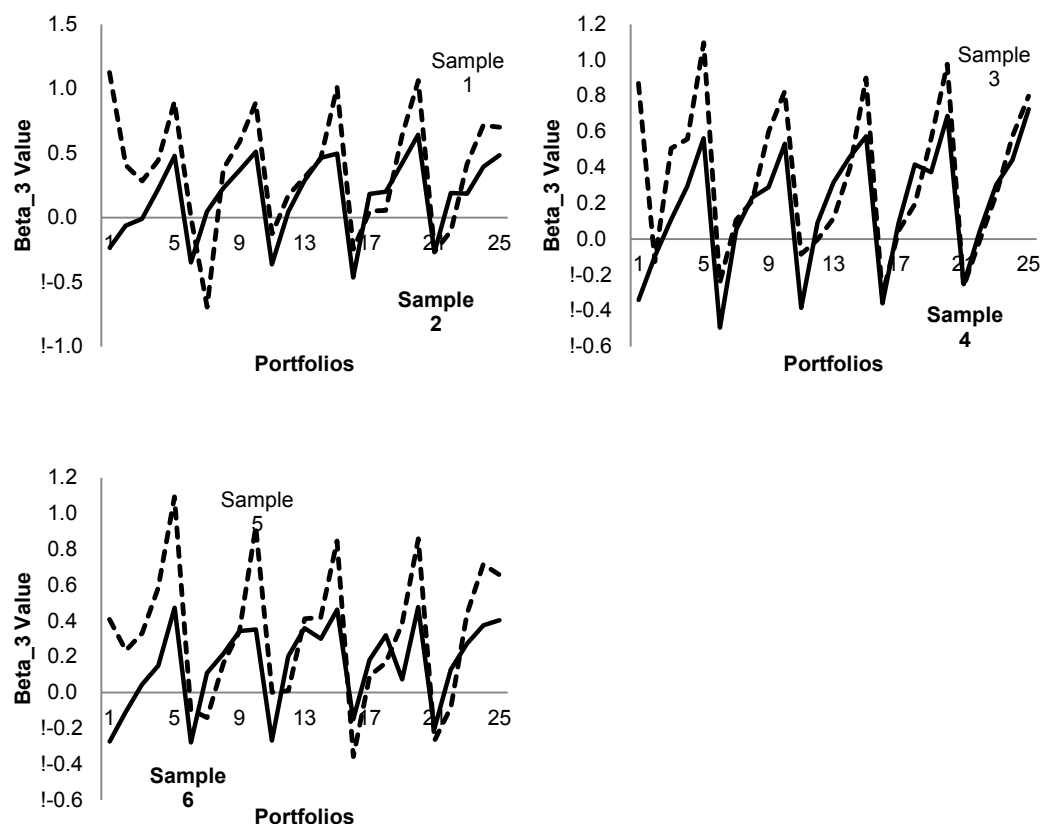

In this section, we implement Kolmogorov-Smirnov test to check residuals for FF-SSAEPD-EGARCH model. The P-values of all the 25 portfolios from the model are displayed in Table 12. For example, the P-value of the portfolio with Small Size and Low Book-to-market is 0.465, greater than 5%. At 5% significance level, the null hypothesis is not rejected and the residuals from the FF-SSAEPD-EGARCH model do follow the SSAEPD. Similar results are documented for all portfolios in 6 sub-samples. We then conclude that the errors of the model do follow SSAEPD, i.e., the FF-SSAEPD-EGARCH model is adequate for most Fama-French 25 portfolios.

CONCLUSIONS

Based on the EGARCH-type volatility in Nelson (1991), non-Normal error of SSAEPD in Zhu and Zinde-Walsh (2009), and the 3-factor model of Fama and French (1993), we compare the 1965, 1970 and 1985 waves of new econometric software with new technology which is different from traditional event chain methodology. Data of US stock market from 1926 to 2011 are split into 6 samples: pre-1965 econometric period as Sample 1 (from 1926 to October 1965), post-1965 econometric period as Sample 2 (from November 1965 to 2011), pre-1970 econometric period as Sample 3 (from 1926 to October 1970), post-1970 econometric period as Sample 4 (from November 1970 to 2011), pre-1985 econometric period as Sample 5 (from 1926 to October 1985), post-1985 econometric period as Sample 6. Method of Maximum

Likelihood Estimation is used to estimate this model and Likelihood Ratio test (LR) is used to test parameter restrictions. The residuals are checked by Kolmogorov-Smirnov test (KS).

Figure 4: Comparison of B_3 Values Before and after 1965, 1970 and 1985 Waves of New Products

Empirical results show that 1) with the split Market factor and the Size factor are alive but the Book-to-market factor are not alive in both 1962 and 1995 Statistical Techniques. The estimated results of 1995 Statistical Technique almost repeat those of 1962 Statistical Technique, which means that the shocks of statistical techniques may have similar impact on data. Future extensions will include but not limited to follows. First, different data can be used to learn the impacts of different generation of econometric software on different countries. Also, more factors regarding of the impact of the econometric advance will be discussed in the new model.

A FUZZY LOGIC APPROACH TOWARDS INNOVATION MEASUREMENT

Víctor Gerardo Alfaro García, Universitat de Barcelona

Anna María Gil-Lafuente, Universitat de Barcelona

Gerardo Gabriel Alfaro Calderón, Universidad Michoacana de San Nicolás de Hidalgo

ABSTRACT

Innovation is a convened critical factor for firm success in today's economic environment. As academics and practitioners acquire knowledge on innovation, tendencies, points of view and practices arise. Yet measurement approaches meant to help decision makers to evaluate their current innovative position do not follow a main stream, moreover much of the information needed for an accurate evaluation tends to be qualitative or subjective. The objective of the present investigation is to review how Fuzzy Logic is currently dealing with subjective complex data in innovation measurement approaches, results will result as implications for further applications in innovation measurement. An examination of new methodologies towards innovation measurement is presented and linked to a systematic review on Fuzzy Logic applications to innovation management. Results convey there is no ultimate model to address innovation measurement in firms, yet a set of innovation measurement key issues are described in novel frameworks. Fuzzy Logic stands as a viable way to adopt decision-making due to its capacity of dealing with uncertain and subjective conditions. According to results, the use of Fuzzy Logic to evaluate qualitative and subjective factors in innovation measurement is encouraged.

KEYWORDS: Innovation Measurement, Fuzzy Logic, Uncertainty, Decision Making

INTRODUCTION

Research on the concept of innovation has been evolving since the last decades, in our days there is no manager or decision maker that could affirm that innovation does not carry competitiveness, it is in some way a given fact. As Porter (1990) states *Companies gain advantage against the world's best competitors because of generating innovations*. The results of innovative activities in firms and organizations can go from the effects over sales and market share up to the improvement of productivity and efficiency. The significant impacts in the sector of activity are the evolution of international competitiveness and the total productivity of the factors; the knowledge spillovers of innovations produced by enterprises and the growth in the volume of knowledge that flows over the network. The earliest definition of innovation was established by Schumpeter (1934) stating *innovation is what we call in a non-scientific way "economic progress", which means in essence the use of productive resources in ways not tested yet in practice, and the retirement of the uses that have had so far*. In a market oriented standpoint. The Oslo Manual (2006) mentions *innovation is the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations*.

Topics within the definition of innovation compile concepts such as: progress, success, solution of problems, etc. Hence, knowing how innovative activities affect companies' performance is also needed to discuss, as it opens the path to attend an important challenge, which is to determine in a systematic way whether innovative efforts within firms are justified, objectives are being reached and the further generation of incentives (Cordero 1990). A correct evaluation, quantification and comparison of the innovative competences of contemporary organizations are difficult since there is no single or main trend to assess

innovation measurement (Frenkel et al. 2000). Yet a generalized measurement framework would provide useful basis for managers to monitor and evaluate their innovation processes and create incentives around them (Cebon and Newton 1999). The objective of the present investigation is to address this gap by revising the main trends on practical frameworks of innovation measurement, identifying common critical elements and utilize Fuzzy Logic to deal with subjective complex data. In order to achieve the task we illustrate a review of innovation measurement, then a methodology section where we present a systematic review on the update roll that Fuzzy Logic has on innovation management. Further we will present results and discuss how Fuzzy Logic could aid decision makers in innovation management measurement and stating final comments.

LITERATURE REVIEW

A Framework to Address Innovation Measurement

Since there is no ultimate model or theory to address innovation measurement, authors have chosen to develop frameworks that represent the main focus areas to consider. One of the latest approaches has been developed by Adams et al., (2006), work based on a review of six innovation models (Cooper and Kleinschmidt 1995; Chiesa et al. 1996; Goffin and Pfeiffer 1999; Cornnican and Sullivan (2004) Burgelman et al. 2004; Verhaeghet and Kfir, 2002) that proposes a seven-factor framework of categories specified in terms of the necessary structural capabilities in a firm to make and manage change. This holistic framework takes in account multiple perspectives e.g. Cooper and Kleinschmidt (1995) whom work focus on the generation of five techno-centric factors for new product performance, yet overlooking the non-technical context of innovation; Chiesa et al. (1996) whom technical innovation audit tool explores a wide variety of indicators that are meant to evaluate the performance of systems and tools that managers hold in order to enable “hard innovations”. Cornnican and Sullivan (2004) explore the continuous and cross-functional connections needed inside an organization to produce effective product innovations.

Table 1: Innovation Measurement Framework Areas

Framework Category	Measurement Areas
Inputs	People Physical and financial resources Tools
Knowledge management	Idea generation Knowledge repository Information flows
Innovation strategy	Strategic orientation Strategic leadership
Organization and culture	Culture Structure
Portfolio management	Risk/return balance Optimization tool use
Project management	Project efficiency Tools Communications
Commercialization	Collaboration Market research Market testing Marketing and sales

Source: retrieved from Adams et al., (2006)

Rather than giving specific measurement proxies of each category described in their framework, Adams et al., (2006) focus their attention on shedding light in useful implications around innovation measurement topics.

DATA AND METHODOLOGY

In order to appreciate how Fuzzy Logic could be utile to the resilient challenges that innovation

measurement drags, we must first know which advances of the Fuzzy Logic theory had reached the scope of innovation management. In order to do so, we propose a systematic literature review (Denyer and Neely, 2004), this clear and reproducible procedure has shown increasing interest among scholars (Adams 2006) and has proven efficiency while dealing with large amounts of information, establishing main paths: development of clear objectives, pre-plan auditable methods, quality execution of the search and synthesis of impartial results using clear frameworks. In our case our main objective is to utilize peer-reviewed journals in order to explore the quantity and quality of articles that have a Fuzzy Logic methodology to address innovation. We concentrated the search in Thomson Reuters database ISI Web of Science, since it compiles one of the foremost influential pools of peer-reviewed articles (Crossan and Apaydin, 2010). Articles within the timespan of January 1986 until September 2014 were included in the search. In order to reach inclusion of a relevant set of articles, the selection criteria utilized was defined first by the Keywords: “Fuzzy Logic” and Innovation*. Document type: Article and Review. No further restriction selections were made. A total of 66 articles were retrieved, this initial set was fixed for further analyses. However, 19 papers were selected for deep analyses due to our criterion of including papers that have Fuzzy Logic as a methodological foundation.

As Table X. shows, articles are scattered around different journals, from environmental and pollution to artificial intelligence topics. The diverse fields that Fuzzy Logic techniques covers describe the flexibility of the methodologies to address different problems of various scientific topics.

Figure 1: Growth of Articles Assessing Innovation Through a Fuzzy Logic Approach

Source: retrieved from Web of Science 2014.

Figure 1. Denotes an increasing trend of publications addressing innovation management with Fuzzy Logic techniques; also it shows the novelty of these kinds of studies in the formal sciences. The increment of publications shows the rising interest from scholars to adopt diverse perspectives to address innovation management. Our methodology has certain limitations e.g. the utilization of the ISI Web of Science narrows the scope of search. A depth analysis discriminated 47 papers out of the original 66 due to diverse issues; the main one is the fact that authors catalogue their work as “innovative”; the introduction of that

keyword mislead the search and results obtained.

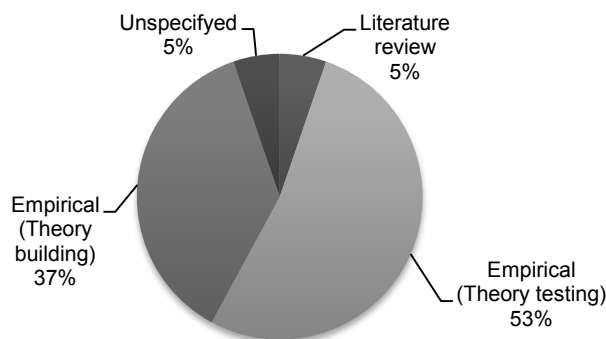

RESULTS AND DISCUSSION

In this section we present the main findings of the systematic review. We firstly present aggregated results, a specific quantification of articles type, followed up by an analysis of the innovation areas that the publications address. Secondly, we present a classification of the main approaches of the chosen articles.

Aggregated Results

From the 19 articles chosen for deep revision, the majority, 10 articles, present an empirical theoretical testing structure, putting in practice diverse Fuzzy Sets theories, being the most recurred theories the use of linguistic variables and fuzzy triangular numbers, thus dealing with imprecision or vagueness in information. A total of 7 articles propose the construction of theoretic frameworks, new approaches to deal with innovation management challenges with emphasis on uncertainty management and experts support systems. From the pool of articles only 1 describes a literature review, mainly focusing on soft computing industrial applications.

Figure 2: Aggregated Results by Paper Type

Quantification of results of the selected papers differentiated by type: empiric, literature review or theoretic. Source: Self-elaborated.

Continuing with the results, the selected papers were catalogued by the innovation area they address (Adams et al., 2006). The majority of the papers reach the scope of innovation inputs and multiple stages; the first oriented to new product development tools and the second addressing several areas of innovation within firms, no main trend of innovation management approach was identified. Knowledge management, portfolio management and actions outside of the firm were recurrent categories; surprisingly we did not find many publications specifically addressing innovation strategy nor organization and culture. It is encouraged to fulfill such gap in the near future because of its importance in the survival of firms.

Figure 3: Aggregated Results by Innovation Area

Number of articles differentiated by innovation area that selected papers attend. Source: Self-elaborated.

Categorization of Articles

A deep categorization of the selected articles was performed. Table X. shows the information retrieved. The articles were classified first by area of specialization, i.e. the main focus of their research paper. Secondly, the approach adopted towards innovation management. Thirdly the specific Fuzzy Logic methodology applied to address the area of specialization. Lastly, the articles were catalogued by the approach they carried out towards the definition of uncertainty.

A deep analysis shows how authors tend to create decision making support models based on Fuzzy Logic to face the inherent characteristics of innovation (Segev et al., 2013). Moreover, they tend to focus models to a specific domain, e.g. Büyüközkan and Feyzioglu, (2004); Achiche et al., (2013) for product development, Kong et al., 2008 for technological innovation capability. Zouggari and Benyoucef (2012) for partner selection models. Innovation is a complex activity, diversified, with a high amount of components that interact with each other creating new sources of ideas and it is difficult to discover the consequences that new events can develop, Escorsa & Valls (2003), in that issue, authors on Fuzzy Logic have combined rough quantitative indicators mixed with experts qualitative information (Kaklauskas and Zavadskas, 2007) to create a robust set of tools to assess innovation e.g.

Taskin and Adali (2004); Serrano and Robledo (2013) for the evaluation of technological innovation capabilities for firms and institutions. The different factors such as competition, rapid markets, highly changing trends and advanced technology have to meet the shifting interests of the firm's stakeholders, a correct visualization of the transversal innovation capabilities is needed, for that matter Maravelakis et al. (2006); Lin et al. (2011) propose Fuzzy Logic based holistic models for the evaluation of innovative capabilities, the first focusing on SME's and the second on service sectors. Even with the diverse approaches to assess innovation, there is a common thing between the articles; the utilization of Fuzzy Logic techniques to address uncertainty in innovation management, whether faced as subjective judgments, partial truths (Ross, 1995), or approximation and characterization of phenomena that are too complex or ill-defined (Zadeh 1975).

Table 3: Categorization of Articles

Author	Area of Specialization	Approach	Methodology	Uncertainty Approach
Büyükoğkan and Feyzioğlu, (2004).	New product development	Fuzzy logic decision making support system	Pseudo-order fuzzy preference model (Roy and Vincke, 1984; Wang, 1997), the fuzzy weighted average (FWA) method (Vanegas and Labib, 2001), fuzzy analytic hierarchy process (FAHP) (Triantaphyllou, 2000)	Information defect (Spender, 1993)
Taskin and Adali (2004)	Technological intelligence as competitive advantages	Technological survey analysis	Fuzzy expert system (Frantti and Mähören, 2001; Ordoobadi and Mulvaney, 2001)	Fuzzy logic to encapsulate partial truths (Ross, 1995)
Maravelakis et al. (2006)	Innovation benchmark for SME's	Three-dimensional fuzzy logic approach for measuring innovation	Fuzzy sets (Zadeh 1965)	Fuzzy Logic qualitative, subjective nature and linguistically expressed values (Yager and Zadeh 1992)
Kaklauskas and Zavadskas (2007)	Pollution minimization and mitigation	Combined expert and decision support systems	Fuzzy relation model (Zhou et al., 2004)	Environmental uncertainty

Uncertainty and Innovation

Uncertainty is an attribute of information, Zadeh (2006). Not simply the absence of information but inadequate, inexact, unreliable and border with ignorance, Funtowicz & Ravetz (1990). Information is the key of the concept because it can increase or decrease the level of uncertainty phenomena express, more knowledge illuminates that our understanding is more limited or that the processes are more complex than thought before, Van der Sluis (1997). For detailed studies about uncertainty, its evolution and diverse perspectives see Walker et al. (2003); Perminova et al. (2008). In the present study we will follow the idea in which uncertainty is present whenever an outcome of a process is not known due to the attributes on the information that surrounds the phenomena. In that sense, what distinguishes innovation management from gambling? Both involve committing resources to something which (unless the game is rigged) have an uncertain outcome, Tidd and Bessant (2013).

It is widely accepted that the concept of Innovation involves uncertainty, imprecision and imperfect or vague information, see McDonald et al. (1994); Gales & Mansour-Cole 1995; Hansen et al. (1998); Tidd (2001); Lane & Maxfield (2005); Hidalgo et al. 2008); Buddelmeyer et al., (2009); O'Connor & Rice (2013); among others. As stated by Tidd & Bessant (2013) *by its nature innovation is about the unknown, about possibilities and opportunities associated with doing something new and so the process involves dealing with uncertainty*. The challenges faced then must be addressed by overrunning that level of uncertainty and providing useful tools in the terms of administration models for the analysis and treatment of variables, taking into count endogenous and exogenous elements, qualitative and quantitative information, among other components.

Fuzzy Logic and Innovation

Studies with a fuzzy-oriented standpoint have been increasing since the last century and have proven efficacy while dealing with complex phenomena. As stated by Bellman & Zadeh (1970) “much of the decision making in the real world takes place in an environment in which the goals, the constraints and the consequences of possible actions are not known precisely”. The theory of decision under uncertainty initializes with the appearance of the article *Fuzzy sets. Information and Control*, Zadeh (1965), and has proven efficiency handling incomplete and uncertain knowledge information see Ribeiro (1996). The theory of Fuzzy Sets has been applied in the field of the formal sciences; nonetheless in the past 44 years researchers from all over the world have been publishing diverse research studies with applications in varied fields of knowledge. As stated by Zadeh (2008) major implications about using Fuzzy Logic into innovation management could be in the machinery of linguistic variables and fuzzy if-then rules, which is unique to fuzzy logic, the concepts of precisiation and cointension that play important roles in nontraditional view of fuzzy logic, the use of Natural Language Computation that opens the door to a wide-ranging enlargement of the role of natural languages in scientific theories, enabling the Possibility theory, which may be viewed as a formalization of perception of possibility a direct relevance to knowledge representation, semantics of natural languages, decision analysis and computation with imprecise probabilities, and Fuzzy logic as a modeling language, which is natural when the objects of modeling are not well defined, e.g., data compression, information compression and summarization.

The result of imprecisiation is an object of modeling which is not precisely defined. A fuzzy modeling language comes into play at this point. This is the key idea, which underlies the fuzzy logic gambit. The fuzzy logic gambit is widely used in the design of consumer products – a realm in which cost is an important consideration. Other applications that have conducted with success the application of Fuzzy Logic in the fields of social sciences can be found in the aggrupation of municipalities under uncertain conditions towards the creation of synergies, Alfaro et al. (2012), aggrupation of stakeholders for a better

administration of enterprises see Gil Lafuente & Barcellos de Paula (2013), a personnel selection model see e.g. Keropyan, A., & Gil-Lafuente, A. M. (2013).

In our research, the adoption and further application of Fuzzy Logic methodologies has multiple significances, at a first instance it introduces the possibility of addressing uncertainty at a different standpoint than traditional methods, also it allows to group, assign, link and relate different variables whether endogenous or exogenous that are present in the process of innovation in certain circumstances of a firm.

CONCLUDING COMMENTS

Results over a systematic review show a novel and increasing interest for assessing innovation management under a Fuzzy Logic approach. Decision support making models for innovation management were found to be the most numerous articles in the systematic review. The treatment of information under uncertain conditions with a high level of confidence is considered one of the main benefits of utilizing fuzzy logic techniques around innovation management. Although there is no ultimate path for measuring innovation in firms, new frameworks lead the discussion towards a set of key activities that must be covered for a firm to continuously revise their innovative capabilities in order to achieve competitive advantages, however much of the information needed to support those key activities tend to be qualitative or subjective. Further research needs to be conducted, firstly to apply the Fuzzy methodologies on specific conditions, and secondary to keep reconnoitering additional Fuzzy Logic models, which could support decision making under undefined environments. Results motivate the use of Fuzzy Logic methodologies in social studies as key for the development of effective innovative strategies in enterprises towards the creation of competitive advantage.

WEAVING A FEW KEY KNOTS IN THE DRAGON'S FINANCIAL SAFETY-NET- A CONCEPTUAL FRAMEWORK FOR THE DEPOSIT INSURANCE SYSTEM IN CHINA

Weikang Zou, University of International Business and Economics
Xianggang Peng, University of International Business and Economics
Nuan Wang, China Credit Trust

ABSTRACT

In the aftermath of the 2007-2009 financial crisis, constant waves of financial re-regulations and new regulatory measures are observed across the world, in which the enhancement of the national deposit insurance system (DIS) draws special attention and is believed to be significant in saving the falling banks, restoring a sound financial order, and effectively controlling and mitigating risks of various kinds by the banking institutions. It is in this context that the present paper explores and studies the ensuing DIS in China, though largely in different scenarios and with varied priorities and focuses. With a carefully designed mixed research method, the present article explores how the deposit insurance system is developed in Chinese financial institutions and what the key challenges are. The present study finds that the evolution of DIS in China is mainly dominated by the PBC as part of the final resort and a response to the liberalization of the financial market. Specifically, the research reveals that a few challenges persist in such new financial safety-net in China, which embrace the uncertainties on the specific form and jurisdiction by the DIS, the potential competition for powers among various financial regulators, the exposures to risks of different kinds, and the coverage issues of such news financial safety-net.

JEL: Conference Proceedings

KEYWORDS: Deposit Insurance, Financial Regulation, Bank, China

INTRODUCTION

In the aftermath of the 2007-2009 financial crisis, constant waves of financial reforms and enhanced re-regulations are observed across the world. In this new round of crisis-targeted regulatory moves, the strengthening of the deposit insurance system (DIS) draws special attention, which is found to be significant in saving the falling banks, restoring a sound financial order, and promoting a resilient financial system. Specifically, as a key component of the overall national financial reconstruction, the DIS increasingly functions as an efficient measure in controlling and mitigating risks of various kinds by the banking institutions. For example, in implementing the Dodd-Frank Act after the financial crisis, FDIC in USA has developed various new measures, such as the rule of the living will (or the resolution plan) for by the systematically important financial institutions, the prohibition of the proprietary trading by the banks, etc. Meanwhile, the EU has also revised its old version of DIS and made drastic changes.

Positioned as one of the three pillars of the national financial safety-net, DIS is being widely accepted and integrated into the national financial system worldwide. As illustrated in Figure 1, ever since 2000, there is observed a fast growth of the DIS across the world. In 2000, there are 71 countries and regions employing the explicit deposit insurance system (EDIS). And up to the end of 2011, a total of 111 of countries and regions have adopted the EDIS, which is around 58% times in contrast with that of 2000. And, at present, 8 countries are officially establishing such financial safety net while 33 countries are actively preparing such explicit deposit insurance system (IADI, 2012). Moreover, as a popular practice, the DIS is being

increasingly applied in member countries of different international organizations. For instance, in 24 member countries of the Financial Stability Board (FSB, 2012), most of the countries have established the DIS except South Africa, Saudi Arabia and China. And, in G20 countries, 16 member countries have adopted the DIS in their financial system. Specifically, there has been found that the developing countries and transitional economies are more actively engaged in setting up such safety-net against the backdrop of the financial reforms and de-regulation movements (FSB, 2012).

Figure 1: the Trend of the Establishment of the Deposit Insurance System Around the World in the Past 50 Years

Source:

IADI,

2012

It is in this context that China have been actively preparing its own DIS, though with varied priorities and focuses. Frequently stressed as a key component of Chinese financial reforms, the DIS is gaining more significance when Chinese financial system is being transferred from the policy guided framework to more market oriented structure. This is especially the case when there is increasing liberalization over the interest rates by the state, the banking industry is becoming more competitive, and the traditional implicit deposit insurance by the state is receding while a new form of the insurance system is required for ensuring a sound financial system, boosting the public's confidence in Chinese banks, and handling the insolvency of the failing banking institutions. Against such backdrop, the present article intends to explore how the DIS has been developed in Chinese financial institutions. What are the key challenges for such financial safety-net, especially considering the specific Chinese institutional embedment? And what are the key factors producing and shaping the arrangement of the deposit insurance in China? For this purpose, the article is arranged as follows. Section 2 provides a rich literature review on the DIS. Section 3 illustrates the method and data employed in the present research. Section 4 demonstrates the findings of the article and effectively answer the research questions. And section 5 concludes and provides issues for further debate.

LITERATURE REVIEW

Traditionally, there has been a hot academic debate over the EDIS and its impacts on the soundness and stability of the national financial system (Diamond and Dybvig, 1983; Chari and Jagannathan, 1988; Kane, 1995, 2000; Calomiris, 1996; Bhattacharya, 1998; Allen and Gale, 1998). The proponents argue that the EDIS will provide better protections for small, uninformed depositors, enhance the public confidence in the

banking system, mitigate the incidents of bank-runs, and ensure the stability of the national banking system (Friedman, 1963; Fama, 1980; Diamond, 1983, 1984; Diamond and Dybvig, 1983; Dybvig, 1993; Demirgüç-Kunt and Laeven 2005; Kane Edward, 2002; Macdonald, 1996; Wang and Wang, 2012

Diamond and Dybvig, 1983). The opponents, on the other hand, challenges that EDIS may largely undermine market discipline exercised by creditors and depositors on banks (Demirgüç-Kunt and Huizinga, 1999), incur serious moral hazards by the depositors, the insured banks, and the financial regulators (Barth, Caprio and Levine, 2001; Keeley, 1990; Richard, 1992; Dekle and Kletzer, 2005), and result in problems of adverse selection and severe rent-seeking behaviours (Kroszner, 1998).

In Chinese context, however, there has been increasing debate on whether to choose the EDIS over the more traditional implicit deposit insurance system (IDIS), though with great variances and national specialties. For instance, Wang and Zou (2005), by elaborating on the interaction between the EDIS and IDIS, find that a 'super' IDIS is being widely used in China which overwhelms the application of EDIS. Zhang and He (2005) argue that the government implied guarantee for banks in China extends beyond the few largest state-owned commercial banks and covers most of the commercial banks and financial cooperatives at the local level. Zhang (2005, 2007) reveals that the IDI is a key component of Chinese specialty in the banking industry which enables Chinese banks of different types to attract voluminous deposit from the households, and these savings are in turn used by the state to finance the national economic development. In this scenario, IDIS takes special significance in Chinese economic development and financial structure.

In contrast, the proponents argue that the establishment of EDIS is an indispensable element for deepening the reform of Chinese financial system, which will facilitate the enhancement of the banking industry, resolving the unequal status of different financial institutions, and lead to the designing of adequate 'exit' mechanism for failing Chinese banking institutions (Li, 2004). Specifically, Li and Han (2008) find that the present IDIS has been adversely affecting the efficiency of financial supervision, typically the bank's lowered capital adequacy, due to the state's implied insurance for the deposits in the banking institutions. And Liu (2006) argues that with the progression of financial liberalization of Chinese financial system, the on-going IDIS is exposed more deficiencies and can no longer function properly as the financial safe-net for Chinese financial system (Zhang and He, 2005; Zhang and Zhao, 2006; He and Shi, 2010; Yin, 2012). Moreover, Xu (2009) reveals that the proceeding IDIS in China may actually motivate some of the under-performed banks to take excessive risks and henceforth aggravating the adverse selection problems. And Wang, Feng (2007) argue for the earlier set-up of the EDIS, which is believed to be able to effectively facilitate the control over major risks in some troubled banks, and mitigate and prevent the occurrence of the systemic financial collapse.

METHODOLOGY AND DATA

Considering the needs and nature of the present study, a mixed research strategy is employed which uses both the qualitative study and quantitative method. In details, these embrace in-depth document study, semi-structured and non-structured interviews, and the statistical analysis. The in-depth document study, as the key tool for the present research, explores the related reports, policy documentation and files, press release by related financial regulators, academics, and banking practitioners with regard to the DIS and its evolution ranging from 1993 to present. Specifically, considering the weight of the central bank of China and the central government in producing the DIS framework and their overwhelming influence in Chinese financial system, we specifically collect and analysed the relevant high-profile speeches, presentation, position paper, and public statement regarding the DIS. The present study arranged interviews as another key method to obtain the 'true opinions' from the field, which embraces interviews on the highly selected academics, senior banking practitioners, and officials who are actively involved in the process of establishing the DIS in China. Last but not the least, based on the databases from the financial regulators and banking association,

the present research collected and analysed relevant data with regard to the key arrangements of the DIS in China. In general, the following issues are prioritised and coded by the present research, including the choice of the organizational form of the DIS, the DIS's jurisdiction and potential competition for powers among related financial regulators, the coverage of the DIS, and the potential risks by relevant covered depository institutions.

FINDINGS AND ANALYSIS

The Challenge of the Organizational Arrangement of the DIS

The first key 'knot to be weaved' in Chinese financial safety-net is the choice of the special organizational form for DIS in the context of the present Chinese financial regulatory regime. Traditionally, there are mainly three organizational forms of the DIS, independent, affiliated to the central bank, or affiliated to other related financial regulators such as the supervisory authority over the banking industry. And increasingly, the DIS has been taking the independent form across the world (Yan and Liu, 2007 ;IADA, 2013). In Chinese context, however, the organizational arrangement of the planned DIS is found to be more complicated due to the less clear division of authority in banking supervision, competitions for regulatory powers, and inefficient coordination and information sharing by various regulators (FT China, April 10, 2014). For instance, there was said a dispute between Chinese central bank (the People's Bank of China, PBC) and the key banking regulator (China Banking Regulation Committee, CBRC) regarding the form of the deposit insurance institution, whether as an internal agency established within the PBC or an independent entity separated from the regulators. Based on the present research, it is found that the PBC has been actively dominating in structuring the overall EDIS framework, and proposed that two phases should be arranged for EDIS in China. At the first stage, a specific deposit insurance fund should be set up within the PBC and be subject to the PBC's supervision. At the second stage, should the preconditions are mature, the DIS can be duly separated from the PBC and become an independent deposit insurance institution, organizationally and functionally, free from any regulation by the central bank (PBC, 2014). And up to now, there seems to be a consensus among the varied financial regulators that a transitional deposit insurance fund is to be established within the central bank, which will be under the direct supervision and control of the PBC's internal Financial Stabilisation Bureau (PBC, 2014)

The Functional Dilemma of the DIS and Competition for Supervision

Another key issue for Chinese DIS lies in its jurisdiction and power for supervision over the insured banking institutions. Functionally, the DIS is postured as one of the three pillar financial safety net, which is frequently composed of the central bank, the DIS, and the related financial regulators supervising the banking industry. And theoretically, they are separated with regard to the regulation and supervision activities over the banking institutions. In Chinese context, though there are clarified legislative division of powers regarding banking supervision between the central bank and the banking regulator, there is observed frequent entanglement and overlap of such regulatory functions. For example, by legislation, the PBC still retains certain functions related to banking supervision for the purpose of preventing and resolving financial risks and maintaining a sound financial system (PBC, 2014). This is especially the case when the PBC acts as the last resort to the troubled banks and provide earnestly needed liquidity. And, CBRC, acting as the dominant financial regulator over Chinese banking industry, is actively engaged in a wide range of supervision activities, including but not limited to regulation on market entrance, on-site and off-site inspection, regulatory intervention, and administration over the re-organization and bankruptcy procedures of the failing banking institutions (CBRC, 2014).

This may poses great challenges to the ensuing Chinese DIS, which is assumed to function as a major market-oriented supervisor over the covered banking institutions, especially taking into account of its affiliation to the PBC at the initial stage. The possible competition over the jurisdiction on banking

supervision by the DIS (when affiliated to PBC) and the CBRC, for instance, is better exemplified by the choice of the 'exit' strategy for the falling banking institutions, which takes on great significance should the banks become insolvent. As the present *Bankruptcy Act of China (2006)* does not design any specific stipulations regarding the winding-up and bankruptcy of Chinese banking institutions, it is frequently the CBRC, based on its legislative functions, that take the responsibility for handling the instances of re-organizations, winding-up, and liquidations of Chinese banking organizations, and initiate related procedures. And, with the set-up of the DIS in China, such function by CBRC will be challenged as the DIS, legitimized as the key stakeholder, significant creditor, and liquidator, will be actively engaged in arranging related processes and procedures for the re-organizations and bankruptcy of the insured member banks when they become insolvent. Meanwhile, more challenges can be expected as the DIS develops, such as competition for powers in supervising the covered banking organizations between CBRC, DIS, and PBS.

The Coverage of the DIS in China and Maximized Reimbursement

Regarding the coverage of the depository institutions by the DIS, He (2005), Zhang (2007), and Liu (2012) argue that the joint stake commercial banks and city commercial banks in China should be mandatorily included, while the foreign-owned banking institutions should be excluded. An interesting issue is the positioning of the few largest state-owned commercial banks in the DIS. Li (2004) and Zhu (2009) opposes the inclusion of these state-owned banks in Chinese DIS considering the majority ownership by the state and the implicit 'unlimited' liability by the state, which may lead to the 'impossibility' of the solvency of these banks. On the flip side, however, Li and Li (1990), Xie (2004) find that the exclusion of such giant state-owned banks make influence the efficiency of the DIS, considering these banks' overwhelming status in Chinese banking industry and financial system. Meanwhile, in consideration of the scales of the deposit by these banks, their exclusion will surely limit the funding sources of the DIS, which may lead to bigger burden by the joining medium-and-small sized commercial banks and cause new inequality (He, 2002). Based on the present research, it is found that the DIS being developed in China intends to cover all the financial institutions taking deposit (PBC, 2014). These pertains to depository institutions of various kinds, which amounts to around 3,500 by the end of 2010, including 3 policy and national development banks, large-sized state owned commercial banks, 12 joint stock commercial banks, 147 city commercial banks, 85 rural commercial banks, 223 rural joint cooperatives, 2,646 rural credits, 1 postal savings bank, 37 foreign invested banks, and 349 operating banks at the country and village level (CBRC, 2011).

Another coverage issue by Chinese DIS is its maximum amount of insurance for insured bank accounts. At present, Chinese DIS as designed plans to employ the limited compensation arrangement. Under the framework of such limited compensation, in case of bank failures, a full repayment by the bank is only limited to the insured amount, beyond which the recourses can only obtained from the liquidated assets of the failing banking institutions. In this sense, in contrast with the traditional unlimited compensation for the depositors the implicit deposit insurance in China, the coming Chinese DIS will develop a limited maximum insurance for each bank account, which will be no higher than 500, 000 RMB. And this capped compensation is actually based on the status quo of the total deposit of over 99% bank account in China, which is less than 300,000 RMB in total by the end of 2010. Nevertheless, considering the complicated financial situations in China and over-emphasis on sound financial market and social stabilization, for a very long period of time even after the DIS is established in China, the unlimited deposit compensation is expected to persist.

The Special Challenge Posed to the DIS by the Medium and Small Sized Banks

Moreover, there is observed another challenge for the successful set-up of Chinese DIS, the inclusion of various small and medium sized banks (SMBs) which may pose potential voluminous risks. From international experience, a very cautious step is taken by the government when including these comparatively more risky financial institutions in the newly established DIS. For instance, at its initial set-

up in 1961. In the initial DIS, the financial cooperatives and rural banking institutions. And these two categories of financial institutions are not qualified to be included in the DIS until 1968 and 1976 respectively. Similar arrangement is also present in the initial set-up stage of the DIS for the SMBs in US. With the fast-paced financial liberalization and reforms in Chinese banking industry, especially the deregulation over the market entrance and interest rates, there has been observed booming development of the SMBs in China. In 2010, the total assets of the SMBs in China was 18.69 trillion RMB, taking around 23.19% in the overall assets of the financial institutions in China. And up to June 2013, the total assets of the SMBs rose to over 32.25 trillion RMB, taking over 29.11% of the total assets of Chinese commercial banking organizations.

These make the SMBs a key cluster of the depository institutions to be included in Chinese DIS. However, due to various defects and deficiencies in their governance and business activities, these banking organizations may frequently bring about greater risks and expose the DIS to potentially voluminous losses. Taking the example of the rural cooperatives which dominates in rural regions of China, it is found that there were over 5,000 rural cooperatives in China by the end of 2013, with the total balance of their deposit, loans, and assets going beyond 1.28 trillion RMB. Based on the estimated ‘exit proportion’ of the depository institutions after the DIS is established in China, even if only 1% of such rural cooperatives is assumed to be disqualified, wind-down or acquired annually, around 115 billion RMB will be reimbursed by the DIS for the insured deposits held by these rural cooperatives (which aims to protect 90% of the deposits by the insured banking institutions). And in practice, the percentage of the highly risky rural cooperatives may go far beyond 1%, as only less than 10% of Chinese rural cooperatives is said to have developed sound operations and governance arrangement. This implies that more reimbursement may be paid rather than the estimated 115 billion RMB. These may even disrupt the operation of the planned DIS, whose fund is estimated around 100-150 billion RMB annually at the initial stage.

CONCLUSION

In sum, the present article explores the general conceptual framework of the approaching DIS in China, especially the key arrangements and challenges to such new financial safety-net in the context of specific financial institutional settings and regulatory regime of China. The research finds there is being established a comparatively adequate deposit insurance system in China after over 20 years efforts, especially accompanying the recent drastic financial reforms such as the lifting control over the interest rates. Nevertheless, challenges of various kinds, as the ‘key knots’, need to be sorted out and ‘weaved’ in this new financial safety-net. As revealed by the present study, there are still some uncertainties about the final organizational form of the new DIS in China. And the jurisdiction and power to supervise the covered banking institutions by Chinese DIS needs further clarification, considering the traditional competition for power for supervising the banking industry by varied financial regulators. Moreover, the research finds that the coverage by Chinese DIS, such as the inclusion of the types of the banking institutions and the maximum insurance for depositors, needs to be further finalized. Specifically, it is revealed that careful step should be taken when including the SMBs into the DIS which may frequently bring voluminous risks and even disrupt the DIS’s operation due to limited funding at its initial stage. In this context, the present research expects that the ensuing Chinese DIS will carry many transitional characteristics and need to be developed gradually, in parallel with the liberalization process of Chinese financial system and the latest moves from global financial reforms.

THE RELATIONSHIP BETWEEN PERSONALITY AND CONSUMER BEHAVIOR BUYING PATTERNS WITHIN THE AUTOMOBILE INDUSTRY

Lucinda Parmer, Miami University
John Dillard, University of Houston-Downtown

ABSTRACT

The automobile industry is an enormously competitive and complex landscape. Auto dealerships compete to gain new customers, and advertise heavily to retain existing customers for repeat purchases. Differing forms of advertising are used for dealerships to achieve an advantage over the competition including, television, radio, print, outdoor, and word-of-mouth communications. Persuading a customer to become, and remain brand loyal, to a specific make, or model of a car, is challenging, but this continued cash stream back into the dealership is a profitable source of revenue that derives from these repeat customers. This paper examines the Big Five personality traits taken from the Mini-International Personality Item Pool (Mini-IPIP) (Donnellan et al., 2006) within a 33-item automotive questionnaire that examines the overall buying experiences of the participants such as the likelihood to recommend a brand, the likelihood to repurchase a brand, type of ownership (purchase versus lease), and includes prior brand repeat ownership information. Demographic variables are additionally accounted for in the overall automobile buying experience, which includes age, gender, level of education, marital status, number of children, and the annual household income of survey respondents. Significant statistical analysis was found in all areas.

JEL: M30, M31

KEYWORDS: Consumer Research, Marketing, Brand Preference

INTRODUCTION

The automobile buying experience is an occurrence that involves comparison-shopping through local car dealerships, automobile websites, and word-of-mouth communications. Communicating with car dealer sales representatives on which type of vehicle to buy can result in a tedious buying experience. Moreover, buying a car is an important decision that consumers make several times during their lifetime. During the car buying process many questions come up such as which brand of car to purchase, what type, make, or model of vehicle to purchase, and whether or not, to lease or own the car (Caribbean Business, 2013). This paper analyzes consumer behavior buying patterns, taking into account personality and demographic characteristics, within the automobile industry. Specific analysis looked at the likelihood to recommend a brand, the likelihood to repurchase a brand, and previous brand ownership.

LITERATURE REVIEW

Although there were no exact matches in the literature on what specifically this study was about, there were several articles found that had similar research areas including consumer attitudes, brand loyalty customers, customer satisfaction, customer relationship commitment, personality in buying patterns, repeat customer analysis, and relationship marketing. Bodey and Grace (2007) analyzed personality characteristics on consumer attitudes. Consumer's attitude towards complaining about a product had positive effects on the tendency of the consumer to complain. Li et al., (2012) found that customer loyalty is a huge component to a company's overall success. Faithful customers are less price sensitive, and more likely to purchase regularly. Loyal customers provided a steady revenue stream for companies. Relationship quality reduced buyer's remorse, and reinforced the relationship between the shopper, and the dealer. Trust, price deals,

commitment, and education level were positive predictors for word-of-mouth communications. Customer satisfaction, commitment, and price deals were positive predictors for purchase intentions. Likewise, trust, commitment, and price deals, were significant influences on customer loyalty. Customer satisfaction was also a positive influence towards customer purchase intentions (Li et al., 2012). Srivastava and Owens (2010) discovered that new brands entering the market, increased use of sales promotions, unconventional forms of distribution, and a decrease in advertising made maintaining brand commitment progressively difficult. Repeat customers could give a vital competitive advantage to organizations. Loyal customers lower a firm's acquisition costs (Kotler, 2000). Customer loyalty is defined as the relationship between relative attitude, and repeat patronage (Heere & Dickson, 2008). Commitment to a relationship is a relatively stable, robust, and passionate psychological state, or approach, towards maintaining that relationship (Chakraborty, Srivastava, & Marshall, 2007).

The personality traits of agreeableness, and conscientiousness were found to have a positive relationship with preference for consistency. Resistance to change and brand commitment were positively related. True loyalty is commitment based. Constancy measures, such as repeat purchases, can be disingenuous due to overlooking such factors as listlessness, and habit (Srivastava & Owens, 2010). Loyalty is the extent to which the customer desires to sustain a long-term relationship with the firm (Fullerton, 2003). One stimulus for customers to engage in relational exchanges is to save money (Peltier & Westfall, 2000). Companies habitually rewarded loyal customers with a distinctive price offer, however, competitors could easily match this, and therefore, it did not become an ongoing competitive advantage. Structural bonding tactics increased the switching costs, and this level of relationship marketing, which pertained to both partners desiring to partner in order to achieve something, ranked highest in the relationship bonding tactics, and conferred the largest likelihood for firms to create a long-term competitive advantage (Ibrahim & Najjar, 2008). Relationship bonding tactics are helpful in improving customers' loyalty, and relationship marketing tactics could efficiently increase the awareness of customers' trust, and commitment to the brand and/or firm (Armstrong & Kotler, 2000; Gruen et al., 2000). Homburg and Giering (2001) asserted that customer's personality tempered the expansion of a relationship strategy, and it also demonstrated that the strength of a relationship between fulfillment, and customer constancy, was influenced by the individual's personal characteristics.

DATA AND METHODOLOGY

The current research aimed to examine the relationship between personality, and consumer behavior buying patterns within the automobile industry. A 33-item questionnaire was administered in person and online by the authors. The subjects were working professionals in the Houston, Texas metropolitan area. Consumer buying behavior was assessed using 4 different items. Type of ownership was categorized as purchase or lease. The likelihood of recommending, or repurchasing the current brand, was assessed using a 10 point scale where 0 = not likely at all and 10 = extremely likely. The number of previous automobiles of the same brand previously owned, or leased, was categorized as none, 1, 2 or 3+. The personality assessment instrument used was the *Mini-IPIP* (Donnellan et al., 2006) that measures the *Big Five* (McCrae & Costa, 1987) personality traits, which included conscientiousness, agreeableness, neuroticism, openness to new experiences, and extraversion. Information on the demographic characteristics of respondents was also obtained (age, gender, level of education, marital status, number of children, and annual household income). The responses to each section of the questionnaire (e.g. buying behaviors, personality traits, and demographic characteristics) were summarized as frequency (percentage) for categorical variables, and median (interquartile range [IQR]) for scales.

Within the univariable analysis, the relationships between the likelihood of recommending the brand, the likelihood of repurchasing the brand, and each of the five personality traits were assessed using Spearman's correlation coefficient (r). Each personality trait was compared between those who purchased, and those who leased their vehicles using the Mann-Whitney-U test, and by number of vehicles previously owned

using the Kruskal-Wallis test. To determine which factors were independently associated with vehicle buying behaviors, stepwise multivariable regression models were used. For all four behaviors, only variables significantly associated with the behavior were entered into the model with all models based on the same linear predictor:

$$u = \alpha + \beta X + \varepsilon \quad (1)$$

where X was a matrix of all demographic and personality variables selected into the models and β a vector of the corresponding regression coefficients.

For type of ownership, a binary outcome, logistic regression models were applied in the form of

$$\text{Logit}(P(Y)) = u$$

where $P(Y)$ was probability, or leasing a vehicle.

For likelihood of repurchase, or recommending a brand, linear regression models were used where u in equation (1) was the likelihood of repurchase, or recommendation. Finally number of previous brand vehicles owned, or leased, was treated as ordinal (as the final category was collapsed at the time of data collection as “3+”), and so a cumulative logistic (proportional odds) model was used. The model takes the form of

$$\text{Logit}(P(Y > j)) = u$$

where Y was the number of vehicles previously owned, and j was the level of Y .

P-values of variables not included in the models were calculated by adding each factor; one at a time, to a model containing all the factors included in the model and was displayed in the tables alongside the significant results.

All tests were 2-sided and the notation ***, **, and * showed significance at the 1, 5 and 10 percent levels respectively. All analysis was conducted using IBM SPSS Statistics.

RESULTS

The respondents in this survey consisted of 488 working professionals. Sample subjects were 51% female, and 49% male. The unadjusted relationship between buying behaviors, and the *Big Five* (McCrae & Costa, 1987) personality traits are summarized in Table 1. Type of ownership was significantly associated with the extraversion domain. Those who lease their vehicle scored higher with a median (IQR) of 15(13-17) compared to those who purchased (13(12-17)) ($p = .008^{***}$). The likelihood of recommending, or repurchasing the current automobile brand, both showed a significant correlation with the conscientiousness domain ($r = .128, p = .005^{***}$; and $r = .123; p = .006^{***}$), respectively. There was no association between number of vehicles previously owned, and personality.

Table 1: Univariable Association between the Personality Traits and Vehicle Buying Behaviors

Mini-IPIP Domain	Conscientiousness		Agreeableness		Neuroticism		Openness		Extraversion	
		P		P		P		P		P
Ownership type, median (IQR)										
Lease	16(14-18)	0.184	14(13-17)	0.650	11(9-13)	0.860	15(13-17)	0.266	15(13-17)	0.008***
Purchase	15(13-17)		15(13-17)		11(9-13)		15(12-17)		13(12-17)	
Recommendation likelihood, r	0.128	0.005***	0.037	0.412	0.005	0.905	-0.002	0.957	0.026	0.569
Repurchase likelihood, r	0.123	0.006***	0.031	0.497	-0.022	0.628	-0.034	0.458	-0.027	0.549
Number previously owned, median (IQR)										
None	15(13-17)	0.383	15(13-17)	0.348	11(9-13)	0.723	14(12-16)	0.309	14(11-16)	0.809
1	15(13-17)		14(12.25-17)		11(9-13)		15(13-16)		13(11-15)	
2	15(13-17)		14(12.75-16.25)		11.5(9-13)		15(12-17)		13(11-16)	
3 or more	16(13-18)		15(13-17)		11(8-13)		11(8-13)		14(11.25-15)	

This table summarizes the relationship between personality traits, and buying behaviors. Scores in each personality trait summarizes across ownership type, and number of vehicles previously owned, as median (IQR) and compares using Mann-Whitney-U tests, and Kruskal Wallis tests. The relationship between likelihood of recommending current brand, repurchasing current brand, and each of the personality traits is summarized using Spearman's correlation coefficient (r).

The relationships between ownership type and number of vehicles of the same brand previously owned are broken down by demographic characteristics in table 2. Type of ownership varied significantly only by ethnicity ($p = 0.020^{**}$) with the highest rate of leasing observed among Hispanic respondents (14.6%) and the lowest in Asian (3.4%), though annual household income was borderline significant ($p = 0.074^*$) with those with \$200,000+ in annual household income more likely to lease their vehicle. The number of vehicles previously owned differed with the age of the respondent with those in the older age group the most likely to have owned 3 or more of the same brand previously ($p < 0.001^{***}$). There were also differences by ethnicity ($p = 0.047^{**}$) with 27.1% of Asian respondents previously owned 3 or more of the same brand compared to 8.2% of African Americans. Respondents with graduate degrees were also the most likely to have owned 3 or more of the same brand with re-ownership increasing with education level ($p = 0.004^{***}$). There were also significant differences by marital status ($p = 0.005^{***}$), number of children ($p < 0.001^{***}$) and household income ($p < 0.001^{***}$), with those who were married, with higher levels of education and more children likely to have owned the largest number of vehicles by the same brand.

Table 2: Univariable Association between Demographic Characteristics Broken Down by Ownership Type and Number of Vehicles Previously Owned

	Ownership Type			No Previous Vehicles of Same Brand				p-value
	Purchase, N(%)	Lease, N(%)	p-value	None, N(%)	1, N(%)	2, N(%)	3 or more, N(%)

This table displays the demographic characteristics of respondents broken down by ownership type and number of vehicles previously owned. Comparisons were made using the Chi-squared test or Fisher's exact test, as appropriate.

The distribution of scores representing likelihood of recommending or repurchasing the brands broken down by demographic characteristics are displayed in table 3. The only characteristic by which likelihood of recommending the brand significantly varied was age ($p = 0.006^{***}$) where the oldest respondents, i.e. those 56 years or older, reported a median likelihood of 10 (9-10) while in all other age groups the median (IQR) was 9 (8-10). The likelihood of repurchasing the vehicle also varied significantly only with age ($p = 0.003^{***}$) with the likelihood increasing with age. In 18-25 year olds the median (IQR) was 8(7-9), rising to 10(8-10) in those ages 56 or older. Annual household income was significant at the 10% p-levels for both outcomes ($p = 0.078^*$ and $p = 0.080^*$) with a trend towards those who had higher incomes being more likely to recommend or repurchase the same brand again.

Table 3: Univariable Association between Likelihood of Recommending and Repurchasing the Current Brand and Demographic Characteristics

This table provides the median (IQR) scores on the scales used to rate likelihood of repurchasing and of recommending the current brand by demographic characteristics. Comparisons between groups were made using the Mann-Whitney-U test of Kruskal Wallis test, as appropriate

To determine which personality traits influence buying behaviors, after adjusting for, and demographic characteristics were considered, multivariable stepwise regression models were used, the results of which are presented in Table 4. Among demographic characteristics, ethnicity was the only factor that was significantly associated with all four buying behaviour indicators. Asian respondents were the least likely to lease their vehicles, and Hispanic respondents were over 3 times more likely to lease than White respondents (OR=3.166 (1.450-6.914)). Respondents of Other ethnicity were the least likely to indicate that they would recommend, or repurchase their current vehicle but were the most likely to have previously owned vehicles of the same brand. Speculating, based on the overall demographics of the respondents, we believe Other to represent the Middle Eastern community.

Table 4: Multivariable Associations between Vehicle Buying Behaviors, Personality Dimensions, and Demographic Characteristics

	Ownership Type		Likelihood of Recommendation		Likelihood of Repurchase		Number Previously Owned

This table displays the demographic characteristics and personality traits that were independently associated with buying behavior. Logistic regression was used to model the odds of leasing the current vehicle and results summarized as odds ratios (OR). Linear regression was used to explore associations with likelihood of recommending or repurchasing current brand of vehicle. Cumulative logistic regression models were used for number of vehicles previously owned. The ORs indicate the odds of having previously owned an additional vehicle.

Age was also a significant predictor of likelihood of repurchasing, and having previously owned the same brand, with those in the oldest age category most likely to indicate they would repurchase, and most likely to previously own more vehicles within the same brand. Number of children was a significant predictor of the number of vehicles previously owned with participants who had no children the least likely to report previous ownership. Level of education and annual household income were both significant predictors (*p*

= <0.10) of number of vehicles previously owned with those with higher incomes, and highest levels of education tending to be more likely to have previously owned a greater number of the same vehicle. After adjusting for significant demographic variables, extraversion was associated with ownership type ($p = .021^{**}$). For every one-point increase in the extraversion score, the odds of leasing a vehicle, rather than purchase, increased by 12.6% (OR=1.126 (95% CI 1.018-1.245)). Level of conscientiousness was associated with how likely a respondent was to recommend their current brand ($p = .027^{**}$). For every one-point increase in the conscientiousness score, the mean score on the recommendation scale increased by 0.059 (0.007-0.111). Agreeableness and openness to new experiences were both significantly associated with the odds of having previously owned vehicles of the same brand ($p = .008^{***}$ and $p = .001^{***}$), respectively. For a one-point increase in the agreeableness domain, the odds of having previously owned one additional vehicle increased by 8.1% (OR=0.919 (0.863-0.978)). Conversely a one-point increase in the openness to new experiences domain was associated with a 10.6% increase in odds (OR=1.106(1.042-1.173)). None of the personality traits were associated with likelihood of repurchasing the same vehicle.

DISCUSSION

The effects of this study show that the participants who scored higher in extraversion are more likely to lease a car versus outright purchase a car. Customers who are more conscientiousness are more likely to recommend or repurchase their current automobile brand. Hispanics are more likely to lease their car, and Asians are the least likely to lease a vehicle. Those in the older age group (e.g. 56+) are more likely to have owned 3 or more of the same brand, and more likely to recommend and repurchase their current car brand. Asians are more likely to own 3 or more of the same brand, with African-Americans owning the least amount of the same brand overall. Respondents with higher incomes, and highest levels of education (e.g. graduate degrees) tend to be more likely to have previously owned a greater number of the same vehicle. Those who are married, with higher levels of education and more children are more likely to have owned the largest number of vehicles within the same brand. Additionally, those with higher incomes are more likely to recommend or repurchase the same brand.

Hispanic respondents are most likely to lease a car, 3 times more than Whites, while Asians are the least likely to lease. The Other ethnicity group (speculative to be Middle Eastern responders) are most likely to have previously owned vehicles of the same brand, however, they are the least likely to recommend or repurchase their current vehicle. Participants with no children are least likely to have prior brand ownership. The more extraverted the participants, the more likely to lease over purchase a car. The more conscientious the participants are, the more likely to recommend their current car brand. The more agreeable and more open to new experiences the participant is the more likely to have previously owned vehicles from the same brand.

CONCLUDING COMMENTS

Upon reviewing the analysis of this study, it is determined that demographic features, and personality dimensions do play a significant role in whether a buyer will recommend, repurchase, have prior brand ownership of a particular brand, and will either purchase or lease a vehicle within the automobile industry landscape. This information is important to car dealership owners, managers, sales teams, and staff in a variety of ways. Dealers typically have demographic data of their customers on hand. This information is found internally through the customers' application process, and service appointments. Dealers could seek using a personality survey to gain more of an insight into their customers' personality dimensions, and then tailor dealership marketing efforts to reach out to those particular customers that are more inclined to recommend, repurchase, be on-going repeat buyers, and purchase or lease through these identified personality dimensions. Utilizing the customers' demographic information by having customers complete a brief demographic questionnaire could likewise do this. With the dealers conducting both a spontaneous personality analysis on their customers, as well as, having access to customer demographic characteristics,

whether documented or observed, this could allow the dealership to modify their sales and marketing approaches to gain repeat customers, specific repeat car brand buyers, as well as, those particular customers who are more likely to recommend a brand could be besought for family and friend contacts to further market to, as well.

THE FOUNDATIONS OF BALANCE SHEET AND THE INEQUALITY OF THE BASIC ACCOUNTING EQUATION FROM THE VIEWPOINT OF SET THEORY

Fernando Juárez, Universidad del Rosario

ABSTRACT

The basics of financial accounting in the balance sheet and the basic accounting equation are revisited from the viewpoint of axiomatic set theory and predicate logic. The conceptual distinction between assets and claims on the assets are pointed out to allow for the application of set theory; next, it follows an application of the axioms of the theory. This application leads to obtain two sets of monetary units, which represent assets and claims (Liabilities and Equity) on the assets. These sets are properly built, according to the applications of the axioms, and comprise all the grouped items, still with financial meaning, of the lower levels in the balance sheet. An equality relation is applied to the classified balance sheet, according to these sets, to determine the equality of assets to the union of liabilities and equity; the application resulted in an inequality. This inequality is interpreted with the restriction of the application of the set theory. The special case where the basic accounting equation holds is described; however, this case has no financial meaning.

JEL: G3, M2, M4

KEYWORDS: Corporate finances, Financial accounting, Balance Sheet, Basic accounting equation, Set theory.

INTRODUCTION

Balance sheet is based on the equality of assets to liabilities and equity. This equation is the fundamentals of the financial statements and analysis. However, different views in financial accounting analysis exist; i.e. conservatism accounting (Wang, 2013) or semiotic linguistic theory (Macintosh and Baker, 2002). Besides, chaos and complexity theories provide with a different approach to financial accounting. Juárez (2012, 2013, 2014) described the use of belief logic (see Smullyan, 1986) and para-consistent logics in financial analysis. Historically, it has been an interest in reviewing the foundations of financial accounting. Sterling (1967) reviewed the theoretical basis of accounting and, later on, Bauman (1996) explored the theoretical framework in fundamental analysis. Still later, Christensen (2010) discussed the conceptual frameworks of accounting. The accounting equation has also been analyzed (Nicol, 1968); however, analysis is made assuming the equation is true. Nevertheless, a rationale exist that gives support to the equation, Consequently, in this research, the rationale for the basic accounting equation from the set theory and predicate logic is analyzed.

LITERATURE REVIEW

Few works have been done introducing logic and axiomatic theories into accounting. The use of the axiomatic theory by Carlson and Lamb's (1981) is complete and deep. They also made a reference to Mattessich (1957, 1964) and the impressive work he did, pointing out the fact that Mattessich system uses set theory while they uses predicate logic. Finally, they provide mechanisms to deduce and preserve the accounting equation. Additionally, the approach of chaos and complexity introduces propositional, belief and circumscription logics, and dialogic in financial analysis (Juárez, 2012, 2013, 2014). Therefore, this

investigation used the axiomatic set theory of Zermelo-Fraenkel (Zermelo, 2004, original 1908) and predicate logic to determine the logical truth of the basic accounting equation.

METHODOLOGY

The method is objective, rationalistic, deductive and analytical.

RESULTS AND DISCUSSION

Any capital unit is defined as an asset, and a liability or equity resulting in the sets A , L and E . By the axiom of power set, the subsets current assets, long-term investments, property, plant and equipment and intangible assets are subsets of A . Besides, the set L comprises current liabilities and long-term liabilities. These sets also comprises other sets, such as notes payable or mortgage payable, among others; all of them are subsets of L . The same goes to E , which includes the sets issued capital, common stocks or retained earnings, among others; they are subsets of E . Applying the axiom of union, the set L_n consists of all of the individual liabilities elements; the set C_n comprises the elements that are claims on the assets and the set A_n includes all of the assets subsets. By the axiom of extensionality, the sets A_n and C_n are compared. The axiom of specification allows determining that the capital units of each subset of C_n has similar capital units spread over the subsets of A_n . Accordingly, the subsets of A_n are not congruente with the subsets of C_n and, due to this lack of correspondence, $C_n \neq L_n \cup E$, and, in general

$$A \neq L \cup E$$

As a special case, a new application of the axiom of union would result in sets A_m and C_m , each of them with all the single capital units. According to the axiom of extensionality, these sets are equal and, consequently, $A = L \cup E$. Nevertheless, this solution is trivial and has no financial meaning.

CONCLUSION

The result shows that the equation is an inequality. However, despite it has been pointed out that the union of two sets is equal to the algebraic sum (Kragh, 2001) this result must be understood within the restriction of the set theory.

AN EMPIRICAL ANALYSIS OF MONETARY POLICY REACTION FUNCTION: EVIDENCE FROM NIGERIA

Ikechukwu Kelikume, Lagos Business School Nigeria

Faith A. Alabi, Edward Kingston Nigeria Associates

Roseline Chizoba Ike-Anikwe, IMT, Enugu Nigeria

ABSTRACT

The changing and unpredictable nature of the money demand function has led many Central Banks authorities around the world to shift from exchange rate and monetary policy targeting to inflation targeting framework. The gradual shift to inflation targeting has reawakened interest in the Taylor's Rule which states that nominal anchor interest rate must be raised by more than a proportionate change in inflation to achieve price stability. The main aim of this study is to determine how the Central Bank of Nigeria responds to the dynamic and changing macroeconomic environment. The monetary policy reaction function developed for this study is derived following the basic structure of the Taylor's rule. Using secondary time series data sourced from the Central Bank of Nigeria Statistical Bulletin covering the periods 1998:Q1-2014:Q2, the study builds on the Taylor rule to formulate a model that track the Central Bank of Nigeria monetary policy reaction function. The method adopted in carrying out the study is the Auto Regressive Distributed Lag Modeling technique. The stylized fact of the study shows that monetary policy variables are moving along same path accompanied by declining inflation and improved productivity. Results obtained from the study will be used to track stability and dynamics of the Central Bank reaction function and to predict the future direction for monetary policy in Nigeria.

KEYWORD: Monetary Policy, Central Bank, Reaction Function, Taylor's Rule

INTRODUCTION

The philosophy of achieving internal balance and external viability has remained the strategic anchor of monetary authorities in Nigeria. Like most Central Banks around the world, the goal of price stability has remained the focus of monetary authorities which is closely associated with maintenance of a stable macroeconomic growth (full employment output and accompanied by stable long-term interest rate and exchange rates. In Nigeria, the success of monetary policy in the last 5 year is evident in the management of inflation which has been brought down and kept low at a single digit level. As at end 2013, inflation in Nigeria at 8.5% was amongst the lowest in the countries in Sub-Saharan Africa.

Despite the success recorded by the Central Bank of Nigeria in tracking inflation successively to a single digit level, efforts at sustained management of price movement and attainment of macroeconomic long term goals calls for increased use of Taylor's rule. The rule which was first proposed by Taylor (1993) and Henderson and Mckibbin (1993), relates to how much Central bank should vary nominal interest rate in response to changes in inflation and other notable macroeconomic aggregates. The rule popularly known as the Taylors principle stipulates that for every one percent increase in inflation, the monetary authorities should raise nominal interest rate by one percentage point (Dvig, Leeper and Eric 2007; Anthanasios 2001). The policy reaction function estimated by Taylor concludes that an interest rate setting rule can be approximated empirically for monetary policy operation. The Taylor's reaction function points to a rigorous altering of Central Bank's nominal interest rate to impact market rates and influence monetary policy short term and long term decisions.

Overtime, the Central Bank of Nigeria has adopted various instruments at their disposal to meet their short term and long term goals. These instruments affect the intermediate and ultimate targets variables through different channels of Monetary Transmission Mechanism. Tools used in recent times include; Open Market Operation (OMO), Reserve money, Exchange rate, and Cash Reserve Ratio (CRR) and the deliberate fixing of the anchor rate at 12% since the fourth quarter of 2011. The paper extends the study of the monetary policy reaction function by focusing on the efficacy of the current CBN monetary policy with the aim of predicting the optimum certainty monetary policy action and the relevance of the Taylor's rule in the management of interest rate and inflation for Nigeria.

Following the broad objective of the paper, the rest of the paper consists of four sections; Section 2 provides an overview of monetary policy in Nigeria and the review of literature, Section 3 prescribes the theoretical framework and model Section 4 presents the data, methodology and analyses the empirical results. Section 5 summarizes the main findings and draws some policy implications.

LITERATURE REVIEW

Overview of Monetary Policy in Nigeria – Stylized Facts

The monetary authority-the Central Bank of Nigeria (CBN) has the power to alter deliberately monetary instruments (direct and indirect) to achieve the intermediate and ultimate target of monetary policy. Unlike many Central Banks around that have shifted to inflation targeting (IT) framework to achieve macroeconomic goals and objectives, the Central Bank of Nigeria uses a mix of the monetary targeting strategy and inflation targeting strategy as the platform for achieving its policy objectives.

Table 1: Instruments of Monetary Policy in Nigeria

Monetary Policy Instruments	Intermediate Target	Ultimate Target
Nominal Anchor rates(MRR/MPR; SLF, SDF)	Money Market	Inflation Stability
Liquidity Management-OMO; LR; CRR	Exchange rate market	Exchange rate stability
Fixed Exchange Rate or Exchange Rate Band(Floating Exchange Rate Regime)	Equity Market	GDP Growth
FOREX Sales (WDAS)	Bonds Market	
Sectoral Allocation of Credit	Deposit Money Banks (DMBs)	
Credit Facilities		
Stabilization Securitization		
Effective 11th December 2006		
Nominal Anchor Rate (MPR, SLF, SDF)	Stability in short term interest rates	Stable value of domestic currency
Liquidity Management-OMO, LR and CRR		Single digit inflation
Effective 7th August and 2nd October 2013 Respectively		
Public Deposit CRR, FOREX Sales (RDAS)		

Table 1 shows the evolution of monetary policy instrument in Nigeria as well as the various monetary policy instruments, the intermediate target variable and the ultimate target variables. New changes in monetary policy instruments effective October 2013 include the introduction of public deposit CRR and foreign exchange sales (Retail Dutch Auction Sales). The ultimate target variable since 2006 include, exchange rate stability, price stability and a stable real GDP growth rate. Note: MRR=Minimum Rediscount Rate; MPR=Monetary Policy Rate; SLF=Standing Lending Facility Rate; SDF=Standing Deposit Facility Rates; OMO=Open Market Operation; LR=Lending Rate; CRR=Cash Reserve Ratio; WDAS=Wholesale Dutch auction Sales; RDAS=Retail Dutch Auction Sales;

The CBN under the monetary targeting platform uses nominal anchors (money supply, exchange rate and interest rate) to manage liquidity and cost, with the overall goal of maintaining a stable macroeconomic environment. The Central Bank of Nigeria explored the Exchange Rate Targeting option from 1959 to 1974. From 1975, the policy option shifted to Monetary Targeting which lasted until 2001, when the Central Bank adopted a mix of Inflation Targeting 2001 and Monetary Targeting Strategies. The basic distinction between the various type of policy option lies primarily with the set of instruments and variables that are used by the monetary authority to achieve their goals. These strategies are usually supported by interest rate and output targeting.

An examination of the trend relationship of selected intermediate and ultimate target macroeconomic variables in Figure 1, suggests that monetary policy rate, growth in real GDP, prime lending rate and inflation are all trending downwards through a well-defined pattern. As indicated by the trend lines in Figure 1.

Figure 1: Trend Relationship between Macroeconomic Aggregates in Nigeria

Figure 1, shows trend relationship between Real GDP growth rates, monetary policy rates, prime lending rates and inflation. The trend shows real GDP growth rate is negatively correlated with inflation and positively correlated with prime lending rates and monetary policy rates.

In Figure 2, real GDP is plotted against potential output to obtain the output gap. The output gap suggests that more monetary stimulus is needed to close the wide gap between potential output and actual output.

Figure 2: Trend relationship in Nigeria

Figure 2, shows a plot between actual output, potential output and output GAP

The typical Taylor’s rule $(r^* + \pi^* + \beta(\pi_t - \pi^*) + \gamma(y_t - y_N))$ with beta (β) and gamma (γ) estimated at 1.5 and 0.5 respectively suggests how central bank should set short-term interest rates to achieve both its short-run goal for economic stability and long-run goal for inflation. This rule further suggest that real Fed funds rate (MPR in the case of Nigeria) should be raised 1.5 percentage points for every percentage point inflation rises above target, and should also be raised 0.5 percentage points for every percentage point raise of actual output above potential output. This is however, is not the case in Nigeria as shown in the Taylor’s equation estimate as shown in Figure 3. The estimate shows a negative relationship between the real policy rate, inflation and output gap. The nominal policy rate is significantly above inflation rate and actual output growth (figure 3) while real policy rate rise by more than 0.5% for every percentage point inflation rises above target or output gap given credence to the fact that the Taylor estimate differ with economic structure (see figure 4).

Figure 3: Trend Relationship between MPR, Inflation and Output Gap in Nigeria

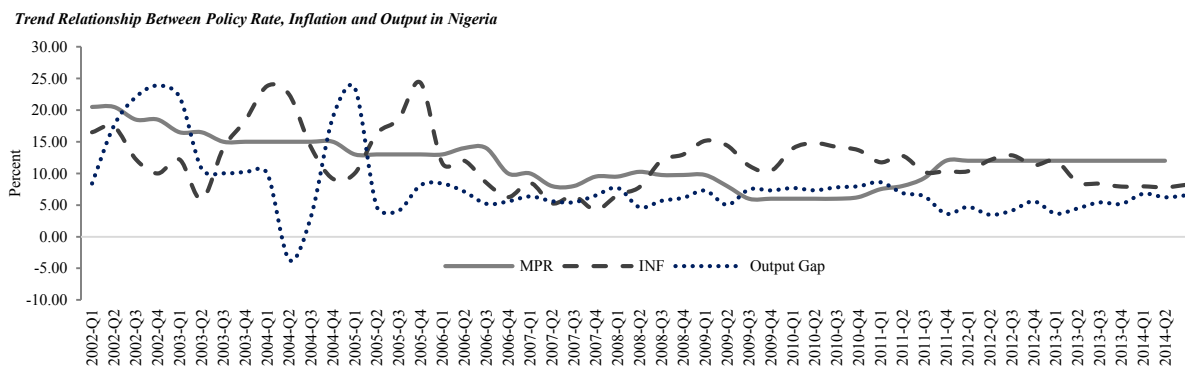

Figure 3, shows the trend relationship between nominal interest rate (MPR), inflation and output gap in Nigeria between Q1: 2002 and Q2:2014. The trend shows a closely tailored movement between inflation and output gap between 2006 and 2014 while MPR has been largely stable and fixed at 12% since Q1:2011.

Figure 4: Analysis of Taylor Estimate and Rule in Nigeria

Figure 4, shows the plot of change in real MPR with change in inflation and output gap. The trend shows a negative relationship between changes in inflation, monetary policy rate and output gap

Empirical Review

Monetary policy rule focuses on rules that are distinguished by the choice of policy instrument which are usually transmitted through the interest rate and monetary base. The concept of Monetary Policy Reaction Function (MPRF) motivated by the pioneering work of Taylor 1993 emphasizes the inverse coefficient of the Philips equation while explaining how central banks reacts to macroeconomic conditions through the altering interest rate.

The foundational work for MPRF by Taylor (1993) used a linear trend of the real GDP to measure potential Output and assumed expected inflation (Targeted inflation) to be 2 percent to show that this rule can perfectly stimulate short-term nominal interest of the United States (US). The policy rule therefore conclude that central bank policy rate rises if inflation increases above the target or if real GDP rises above potential GDP and the central bank policy rate decreases if inflation is below the target or if real GDP decreases below potential GDP.

Subsequent research on the MPRF subject has continued to build-up drawing from the Taylor’s seminal article and generating research conclusions on the Central Bank monetary policy reaction function. The study by Clarida, Gali and Gertler (1998), estimated monetary policy reaction function using Generalized

Method of Moments and found that, Central Banks in U.S., Japan, and Germany pursued an implicit forward-looking inflation targeting which reacts to the expected inflation rather than past inflation.

Judd and Rudebusch (1998) conclude that the Taylor rule prescribe guide on the relationships among variables when conducting monetary policy. Gerlach and Smets (2000) examined whether monetary policy would respond to a shock in exchange rate found a mixed result across countries. They found that Australia's Central Bank does not respond to exchange rates shocks while central banks in Canada and New Zealand respond significantly to a shock to the exchange rate. Assane and Malamud (2000) using the Vector Auto-regression (VAR) model, having studied the relationship between monetary policy and exchange rates found that a weak dollar causes the Fed to raise the federal funds rate thus a rise in the federal funds rate leads appreciation of the U.S. dollar. Romer (2001) argued that the values for the coefficients of the output gap and the inflation gap would change the effectiveness of monetary policy indicating that larger values of the coefficients would cause the actual inflation rate and output to decline more than expected. He suggests that the lagged value of output gap and inflation gap are better proxies.

Hsing (2004) used a VAR model to estimate the Bank of Canada's reaction function, found that the Taylor rule is extended to include exchange rate since the objectives of the Bank of Canada is to maintain currency stability to promote international trade. In a similar study conducted by Hsing and Lee (2004) for the Bank of Korea, they found out in their study, that the call rate reacts positively to a shock to the inflation gap, the output gap, the exchange rate gap, the stock price gap, and the lagged call rate during some of the quarters. They conclude that the inflation gap and the exchange rate gap are more influential in the short run in explaining the variance in the call rate whereas the output gap and the stock market gap are more important in the long run.

Similarly, Galbraith, et al. (2007) applying VAR model found that the Federal Reserve does not react to inflation signals but to the unemployment. Estimating the monetary policy reaction function for European Union countries, Sutherland (2010) found that there exist wide disparities across countries as to determinants of policy reaction. Specifically, the results showed monetary policy in large economies significantly influence monetary policy reactions in smaller ones however, they conclude that monetary policy has reacted less to contemporaneous measures of the output gap, while asset price developments do not generally appear to have influenced monetary policy decisions.

Kaytanci (2008) applying vector error-correction model estimated monetary policy reaction function for Turkey based on an extended Taylor rule. He found that the policy rate responds positively to shock to the output gap, the inflation gap, or the lagged overnight rate while responding negatively to exchange rate.

Employing dynamic ordinary least squares (OLS), Inoue and Hamori (2009) estimated a Taylor-type monetary policy reaction function for India and conclude that the output gap and the exchange rate were statistically significant with their correct signs but the same was not true for the inflation gap

In Nigeria, the study of the reaction function is yet to be entirely explored. The study Iklaga (2009), estimated a Taylor-type monetary policy reaction function, the results suggest that inflationary pressures played a significant role in policy stance. Apanisile and Ajilore (2013) estimated the reaction function under the Taylor's rule using Engle-Granger approach to co-integration. They reached a conclusion that the implementation of monetary policy function was done in effect to achieve price stability. Agu (2007) confirm that inflation is the primary determinant of the central bank's reaction though policy targets usually differ from outcome while the recent study by Doguwa and Essien (2013), found that the reaction function fits the actual policy performance of real monetary policy rate and reserve money.

DATA AND METHODOLOGY

The theoretical base of the monetary policy reaction function is derived from three structural equation, namely the Phillips curve relationship, the aggregate demand model (IS equation) and the uncovered interest rate parity model which formed the bedrock Taylor (1993) monetary policy reaction function.

The derivation of the MPRF begins with the first equation-the Phillips curve relationship. The Phillips curve emphasizes a trade-off between inflation and unemployment by relating inflation directly to output gap. The Phillips curve relationship is expressed in equation (1) as follows;

$$\pi_t = \alpha + \beta\pi_{t-1} + \theta Y_t + \varepsilon_t \quad (1)$$

Where π is inflation, π_{t-1} is inflation lagged by one period and Y is the output gap. α , β and θ are the unknown parameters while ε_t is the error term. The aggregate demand model (the IS equation) relates output gap to interest rate and inflation and the model is expressed as follows in equation (2);

$$Y_t = \alpha + \beta i_t + \gamma \pi_t + \varphi R_t + \mu_t \quad (2)$$

Where Y is the output gap, i_t is the policy anchor rate, π is inflation and R is the nominal interest rate.

The third model-the uncovered interest rate parity model emphasizes exchange rate premium and interest rate differential between domestic and foreign interest rate. The model is expressed in equation (3) as follows;

$$R_t = \alpha + \beta R_t^* + \gamma(\chi_t - \chi_{t-1}) + \mu_t \quad (3)$$

Where R is the nominal interest rate, R^* is anticipated interest rate, χ is exchange rate and $(\chi_t - \chi_{t-1})$ is exchange rate premium. The original version of Taylor's rule however, relates nominal interest rate to assumed equilibrium real interest rate, the divergence between actual inflation rate and target inflation rate and the divergence between actual output and potential output. The equation in its original version is expressed in equation (4) as follows;

$$\hat{i}_t = \alpha + r_t^* + \beta(\pi_t - \pi^*) + \gamma(Y_t - Y_N) \quad (4)$$

The calibration of the three structural equation above yield the simple model for the MPRF which relates policy to output gap and the deviation of inflation from target as shown by the equation below

$$\hat{i}_t = \alpha + \delta(r^* - \pi^*) + \beta(\pi_t - \pi^*) + \gamma(Y_t - Y_N) + \mu_t \quad (5)$$

Where r^* is the average (long-run) real interest rate, $(r^* + \pi^*)$ is the nominal interest rate, $(Y_t - Y_N)$ is the output gap. Thus the model can be expressed in a simplified form as;

$$\hat{i}_t = \alpha + \delta R_t + \beta \pi_t + \gamma Y_t + \mu_t \quad (6)$$

The model links the policy instrument (a short-term interest rate) and the nexus of output, inflation, and the exchange rate in a small-open economy. Following the basic structure of the Taylor's rule (1993) and Doguwa and Essien (2013), we estimate two models to track the performance of CBN monetary policy reaction function with the model for estimation below

$$\hat{i}_t = \alpha + \delta(r^* + \pi^*) + \beta(\pi_t - \pi^*) + \gamma(Y_t - Y_N) + \theta' X_t + \mu \quad (7)$$

Where \hat{i}_t represents monetary policy instrument such as MPR, $(r^* + \pi^*)$ is the nominal interest rate proxy by the Prime Lending Rate (PLR), $\pi_t - \pi^*$ is the divergence between actual inflation rate and target inflation while $Y_t - Y_N$ is the divergence between actual output and potential output. X_t represents other controls of

each model to be estimated, especially the Naira- Dollar exchange rate premium between interbank rate and the official exchange. We introduce the control variable to capture business transactions which are usually carried out using the interbank rate.

Specifically, the model formulated to access and track the CBN monetary policy reaction function is specified as follows;

$$MPR_t = f(R, \pi^*, Y^*, \chi^*) \quad (8)$$

Where MPR is the target short term nominal interest rate (monetary policy rate), R is prime Lending rate, π^* is the divergence between actual inflation rate measured by GDP deflator and the desired inflation rate, Y^* is the divergence between the log of real GDP and the log of potential output while χ^* is the exchange rate premium between bureau de Change and official exchange rate. The model is expressed in linear estimation form as;

$$MPR_t = \alpha + \beta R_t + \theta \pi^* + \delta Y^* + \gamma \chi_t + \mu_t \quad (9)$$

Where on a *priori*, $\beta, \delta, \gamma < 0, \theta > 0$,

The Auto-Regressive Distributed Lag (ARDL) Bound Testing Methodology

Several methods have been applied in the empirical literature to conduct cointegration test and estimate the short run and long run relationships between macroeconomic variables. These methods ranges from the residual based Engle-Granger (1987), the maximum likelihood based Johansen (1991; 1995) test, the Johansen-Juslius (1990) test and the ARDL testing methodology of Pesaran, Shin and Snith (2001). Of the several methods used in conducting cointegration test, the ARDL testing methodology stands out because of its simplicity and use in situations where variables in the model exhibits a mixture of I(0) and I(1) data series.

The uniqueness of the ARDL modeling technique motivates the preference for the ARDL (p,q) modeling technique in place of other cointegration testing procedures to examine the CBN monetary policy reaction function for Nigeria. Drawing from equation (9), the ARDL (p, q) model is defined as follows;

$$MPR_t = \Phi_1 MPR_{t-1} + \dots + \Phi_p MPR_{t-p} + \beta_0 R_t + \theta_0 \pi^* + \delta_0 Y^* + \gamma_0 \chi_t + \beta_1 R_{t-1} + \dots + \beta_q R_{t-p} + \theta_1 \pi^*_{t-1} + \dots + \theta_q \pi^*_{t-p} + \delta_1 Y^*_{t-1} + \dots + \delta_q Y^*_{t-p} + \gamma_1 \chi_{t-1} + \dots + \gamma_q \chi_{t-p} + \mu_t \quad (10)$$

Where, $\mu_t \sim iid(0, \tilde{\sigma}^2)$

Equation (10) is the unrestricted ECM model. From this model, we obtain the ECM regression of the model as follows;

$$\Delta MPR_t = \alpha \hat{\epsilon}_{t-1} + \sum_{j=1}^{p-1} \phi_j \Delta MPR_{t-j} + \sum_{j=0}^{q-1} \beta_j \Delta R_{t-j} + \sum_{j=0}^{q-1} \theta_j \Delta \pi^*_{t-j} + \sum_{j=0}^{q-1} \delta_j \Delta Y^*_{t-j} + \sum_{j=0}^{q-1} \gamma_j \Delta \chi_{t-j} + \psi_1 MPR_{t-1} + \psi_2 R_{t-1} + \psi_3 \pi^*_{t-1} + \psi_4 Y^*_{t-1} + \psi_5 \chi_{t-1} + u_t \quad (11)$$

Equation (11) is the ARDL cointegration model. In the model, the symbol Δ represents the first difference operator. The summation signs in the equation represent the error correction dynamics while the variable with the coefficients ψ 's corresponds to the long run relationship.

To obtain the optimal lag length of the model, we make use of the Schwartz-Bayesian Criteria (SBC) and the Akaike Information Criteria (AIC). To ascertain the appropriateness of the ARDL model, the residual diagnostics, serial correlation LM test is applied for the study.

RESULT AND DISCUSSION

The data used to fit the model consists of quarterly time series data with sample period covering 1998:Q1-2014:Q2. All data were sourced from the Central bank of Nigeria Statistical bulletin and the National Bureau of Statistics, Nigeria. Specific data include changes in real GDP, changes in monetary aggregate (Monetary Policy Rate inflation rate measured by real GDP deflator, real interest rate proxy by the summation of nominal interest rate and inflation and exchange rate premium measured as the difference between interbank rate and the Wholesale Dutch Auction sales. rest rates (Prime lending rate, interbank and Treasury bill rate). With the exception of monetary policy rate, real interest rate and exchange rates, all the other variables are analyzed in quarterly changes of their logarithms.

The uniqueness of the ARDL modeling approach makes it easy for estimation of models with a mix of I (0) and I (1) series but not in the presence of I(2) series. Other cointegration test method such as Johansen-Juselius (1990) and Johansen (1991;1995) requires that all the variables used in testing for short run and long run relationship among the variables in a model must be integrated of order one or an I(1) series. Given the limitation of the ARDL modeling approach which is that the model collapses in the presence of I(2) series, we proceeded to testing for the unit root properties of the variables at their levels and first difference with the aid of the Augmented Dickey Fuller (ADF) unit root testing procedure. The result of the unit root test reported in Table 2 shows that we have no concern for I (2) variables in the model. All the variables were either stationary at levels or at their respective first difference. This presupposes that the ARDL Bound Testing procedure can be carried out by first testing the existence of cointegrating relationship among the variables in the model.

Table 2: Augmented Dickey Fuller Unit Root Test

Variables:	In Levels	Integration	In first Difference	Integration
MPR (r)	1.9008 (0.6427)	I (0)	-6.3764 (0.0000)	I (1)
Real Interest Rate (Re)	-1.9888 (0.5962)	I (0)	-6.3837 (0.0000)	I (1)
Price Gap (INFGAP)	-3.4083 (0.0694)	I (0)	-9.0046 (0.0000)	I (1)
Output Gap (RYGAP)	-2.9574 (0.1529)	I (0)	-5.9937 (0.0000)	I (1)
Exchange Rate Premium (XD)	-8.3309 (0.0000)	I (1)	-9.6459 (0.0000)	I (1)

Note: The table is the result of the Augmented Dickey-Fuller (ADF). The model includes an intercept and a linear trend. The null hypothesis states that the variables have a unit root and the p-values are reported in parenthesis under each of the t-statistic values for each of the variables. The test shows that none of the variables are I (2) series.

After ascertaining the order of integration of the variables, we proceed to testing the existence of long run cointegration relationship between the dependent variables (MPR) and the regressors-output gap, price gap real interest rate and the exchange rate variable. This is done with the aid of the Wald (F-Statistic). The test for the long run cointegrating relationship is carried out by imposing restrictions on the estimated long run coefficients of the nominal interest rate variable (MPR). The imposition of restriction in the long run coefficients is made possible by first determining the lag length of the model through the Akaike criteria and the Schwarz Bayesian criteria.

The calculated F-statistics for the cointegration test is reported in Table 3. The null and alternative hypotheses are as follows;

$H_0 = \alpha_1 = \alpha_2 = \alpha_3 = \alpha_4 = \alpha_5 = 0$ / There exists no long run cointegrating relationship among the variables in the model

$H_0 \neq \alpha_1 \neq \alpha_2 \neq \alpha_3 \neq \alpha_4 \neq \alpha_5 \neq 0$ / There exists a long run cointegrating relationship among the variables in the model.

The computed F-value from the Wald statistic will be evaluated based on the critical values of tabulated in Table CI of Pesaran, Shin and Smith (2001). The value of our F-Statistics is 4.621 and we have $(k + 1) = 6$ variables in our model. From the critical values of the Bound test reported in Table 3 as provided in Table Ci (iii) of Pesaran et al (2001), the lower and upper bounds for the F-test statistic at 5% level of significance is 3.189 and 4.329 respectively. Given that the F-statistic value of 4.6129 > the upper bound at 5% level, we reject the null hypothesis of no cointegrating relationship among the time series variables. Having established the existence of long run relationship, between the variables in the model, we used the Schwarz Bayesian criteria to select the appropriate ARDL specification. The result of the Long run parsimmons ARDL specification is reported in Table 4.

Table 3: F-Statistic of Cointegrating Relationship among the Variables

Test Statistic	Value	Significance Level	Bound Criteria Values	
F-Statistic	4.6129	5%	I (0) 3.189	I (1) 4.329

Note: The table is the result of the cointegrating relationship among the variables in the model. The null hypothesis states that there is no long run cointegrating relationship among the variables in the model.

Table 4: Long Run Parsimonious ARDL Regression Estimate: Dependent Variable is Δ MPR

Variables:	Coefficients	Standard Error	T-Values
MPR(-1)	-0.29*	0.08	-3.72

EXRD (-1)	0.03*	0.01	3.18
D(MPR (-1))	-1155.68*	350.89	-3.29
D(MPR(-2))	1064.96*	334.12	3.18
D(MPR(-4))	5.73**	2.26	2.53
D(RINT (-1))	1155.90*	350.90	3.29
D(RINT(-2))	-1064.69*	334.10	-3.18
D(RINT(-4))	-5.65*	2.23	-2.52
D(INFGAP (-1))	-1168.81*	353.59	-3.30
D(INFGAP(-2))	1052.20*	332.27	3.16
D(INFGAP(-3))	-8.49*	2.71	-3.13
D(EXRD(-1))	-0.01*	0.01	0.01
Constant	1.98*	0.51	3.83

$R^2 = 0.46$; $R\text{-Bar Squared} = 0.31$; $F\text{-statistic} = 3.11$ Prob. ($F\text{-statistic} = 0.002$)

*Note: The table below show the result of the long run ARDL () mode of monetary policy reaction function for Nigeria. The dependent variable is Δ MPR while the explanatory variables are Price GAP variable (INFGAP), Exchange rate premium (EXRD) and real interest rate variable. (RINT). The lag length are selected based on SIC criteria which ranges from lag zero to lag four. The symbol * and ** indicates significant at 1% level and at 5% levels respectively.*

The empirical result reported in Table 4, is obtained by simply normalizing the result of the ARDL model. The optimal model was selected using the Hendry “General to Specific Approach” and the SBC lag length selection criteria. This approach necessitated the dropping off of the variables that were not statistically significant on the basis of the individual test of significance-the student t-test. From the result, the F-statistic value (3.11) easily passed the test of significance at the 1% level of significance an indication that the overall model has a good fit. The R^2 value of 0.46 and \bar{R}^2 value of 0.31 are all indicative that the models have a fairly good fit. On the basis of the individual significance of the parameter estimates all the variables and their lag specifications passed the test of significance at the 1% and 5% level of significance respectively. From the ARDL specification reported in Table 3, the short run and long run effects of the

model was obtained by normalized the equation with the coefficient of MPR(-1) which was well signed significant at the 1% level of significance. The normalization process generated the short elasticities and the long run elasticities which are reported in Table 5. The result reported in Table 5, produced an interesting findings for monetary policy reaction function for Nigeria. The output gap variable proved to have no long term relationship with the CBN monetary policy rate hence the variable was dropped. Only two variables the exchange rate variable and the price gap variable appear to have a significant long run effect on monetary policy rate. The result showed that a 1% increase in Price GAP variable elicited an increase in monetary policy rate by over 44% while a 1% increase in the exchange rate variable raises monetary policy rate by 0.1%. These findings follow earlier conclusion by Agu (2007), Iklaga (2009) and Apanisile and Ajilore (2013). All these studies concluded that the price GAP (inflation targeting) plays a significant role in the Central Bank monetary policy reaction function.

Table 5: Long Run Elasticity and Short Run Elasticity of the ARDL Model

Variables:	Long run Coefficients	Short Run Effects	Long Run effects
MPR(-1)	-0.29		
INFGAP (-1)	13.13		43.83
EXRD (-1)	0.03		0.10
D(MPR (-1))	-1155.68	-3857.97	
D(MPR(-2))	1064.96	3555.09	
D(MPR(-4))	5.73	19.15	
D(RINT (-1))	1155.90	3858.68	
D(RINT(-2))	-1064.69	-3554.21	
D(RINT(-4))	-5.65	-18.87	
D(INFGAP (-1))	-1168.81	-3901.80	
D(INFGAP(-2))	1052.20	3512.51	
D(INFGAP(-3))	-8.49	-28.36	
D(EXRD(-1))	-0.01	-0.49	
Constant	1.98	6.61	

Note: Table 5 shows the short run effects and long run effects of the ARDL model which is obtained directly from the long run coefficients of the result reported in Table 4. The output GAP variable was eliminated from the model because it had no short run or long run effect on nominal interest rate. The only variables that had long run effect on nominal interest rate are the price GAP variable and the exchange rate differential variable.

The result of the short run elasticity shows real interest rate and price Gap as the major variables that determines the monetary policy reaction function for Nigeria. An interesting findings of this study is that the two most important variables that tracks monetary policy reaction function for Nigeria is exchange rate and the price Gap variable. This is quite reviling given the fact that the Taylor rule recommends MPR should be raised 1.5 percentage points for every percentage point increase in inflation above targeted inflation and a raise of MPR by 0.5% for every percentage point increase in actual output above potential output.

CONCLUSION

This paper investigates the monetary policy reaction function for Nigeria. The few studies carried out for Nigeria found evidence of that inflation is the primary determinant of monetary policy reaction function for Nigeria. The method used for this study is the autoregressive distributed lag framework and the frequency of the data used is quarterly time series data. The result provide a strong evidence that monetary policy reaction function for Nigeria is influenced greatly by the price Gap in both the short run and the long run period. The output Gap variable was found to be statistically insignificant in influencing the Central Bank monetary policy decisions. Exchange rate variable and real interest rate variables were also found to be major determinants of monetary policy reaction function.

The policy implication to be drawn from this study, is that in pursuing the goal of price stability in Nigeria the monetary authorities should track the divergence between actual inflation and expected inflation as well

as the divergence in exchange rate differentials between the official exchange rate, bureau de change (BDC) and the interbank rates.

HEDGE FUNDS AND CDS REGULATION. RISKS AND EFFECTS IN THE EU AND INTERNATIONAL BANKING ENVIRONMENT

Thomas Chatzigagios, University of Macedonia, Thessaloniki, Greece
Athanasios G. Panagopoulos, University of Macedonia, Thessaloniki, Greece

ABSTRACT

This paper aims to research whether the use of complex financial products by Hedge Funds, and the Over-the-Counter (OTC) derivatives by Banks, should be additionally regulated. The research work is focused on the existed regulation of Hedge Funds and of credit derivatives and whether a proposed set of regulation reforms could aim in the manipulation of future crisis in the finance environment. The research effort was based on the study of Hedge Funds as a source of investment opportunities for capital markets and economy and of Banks, as described in the literature, as well as the international developments in the regulation of CDS (Credit Default Swaps). The risks faced by investors and banks, studied and analyzed in parallel with the recent efforts to regulate OTC derivatives in European level. The findings and proposals concluded that the impending regulation of the EU, should differentiate the Hedge Funds and redefine their systemic relevance. The findings for the standardized (and non-standardized) OTC derivatives concluded the necessity of the establishment of Central Counterparties, Regulated Reporting Platforms and of a single supervisory authority, responsible for monitoring the regulation and activities of Hedge Funds and the use of CDS by Banks.

INTRODUCTION

Hedge Funds have been developed more than 50 times in terms of managing their assets since 1990, although it is estimated, by themselves that their development is 5-10% of managed assets, in the global market. In recent years, 2007-2013, the volume of transactions of Hedge Funds has been estimated at 50% of the daily trading volume of the equity markets. Despite, however, the great participation of Hedge Funds in the financial system, different opinions have been expressed on the adequacy of the legal framework. Hedge Funds have also been exposed to markets turmoil, resulting in declining yields and profits, for their investors. Given that they had traditionally relied on high levels of leverage, as well as other borrowers, they are embarrassed to gain leverage, in order to finance their investment policies, especially as traditional sources of leverage, as they are. And this happens, because brokers and investment banks have considerably restricted the *back lending*. Hedge Funds have already realized the difficulty of addressing the problem of large outflow of their assets from investors, resulting in a pressure in their prices. Credit Default Swaps (CDS), which are Over-the-Counter (OTC) derivatives (these are traded bilaterally in non-regulated markets), are also the main part of the credit derivatives market and their use, by credit institutions and banks, is enormous. A CDS is an exchange agreement, between two contracting parties which operates, as follows: one party (protection buyer or risk seller) makes periodic payments, in return of receiving predetermined payment from the other contracting party (risk buyer or seller protection), in case when a credit event occurs.

Credit derivatives are products with many important uses, most important of which are to hedge the credit risk. In the market, there are many non-standard products (bilaterally arranged), so every individual risk and fund manager can choose what best suits his own needs. In the near future, the market of credit derivatives is expected to show even greater growth and increase its share of the total derivatives. Additionally, new, structured and more complex credit derivatives may appear. The research is focused on whether Hedge Funds themselves, as well as the use of CDS and OTC derivatives by Hedge Funds and Banks, should be additionally regulated, due to their participation to the recent financial crisis. The remainder of the paper is organized as follows: the next section overviews the relevant literature. Next, we discuss the methodology used in the study. Then, an analysis follows, of the current developments on risks and legislation, regarding the Hedge Funds and the use of CDS by Banks. The results of the research are presented in the following section. The paper closes with some concluding comments.

LITERATURE REVIEW

Hedge Funds are a form of mutual fund, which originates from many investors with the purpose of simultaneous multiple investments, in order to achieve risk diversification, as well as positive performance and return to its investors (Fung & Hsieh, 1997). Although, there is no official definition, we can consider them, as a private equity fund, with investors who have tendency to risk, with high economic prosperity and who primarily seek high returns from their investments. We could also consider them as "*Sophisticated Alternative Investment Schemes*", including many other types of investment funds, which are not covered by the "*Undertakings for Collective Investments in Transferable Securities*" (UCITS). Regarding their strategies on the investment products, we mention, initially the "*short selling*", which has been quite criticized, given that the borrower seeks to gain profits from the decline of the valuation of the creditor portfolio. Widely known strategies are also the so-called "*hedging through long and short positions*" and the "*statistical arbitrage*" (Anderson, 2007).

Numerous strategies - risk neutral - are implemented in the fixed income markets ("*Fixed Income Arbitrage*") having as objective to identify and then to exploit the price disharmony in structured products (Term Structures), the liquidity spreads and the credit spreads, which often occur in the fixed income markets. Besides, the investment strategy of "*structured capital arbitrage*" aims to make a profit without risk, benefiting from the imbalance associated with the value of a debt instrument and of the company's stock (Brown et al., 1997). The next investment strategy is the "*convertible arbitrage strategy*" (concerning convertible bonds), which is the conversion of a security to another one with a specific profit and with a very low risk. Essentially, involves complex conversions of exchangeable bonds to others. Another, also, complicated self-funding strategy, where capital flow generated by shorting the debt created by the market position (long position), is the "*alpha transport*" (Fung & Hsieh, 2004). Hedge Funds are among the largest buyers and sellers between the most traded credit derivatives and other structured products, which have found in the centre of the recent financial crisis (Gregoriou, 2006).

Although credit derivatives offer many benefits, in case which they are not used properly, they can increase some of the risks usually faced by the market participants. Moreover, the use of credit derivatives from Hedge Funds may pervert the existing incentives of monitoring and management of risk (Agarwal, Vikas, and Narayan, 2004). Additionally, banks which avoid monitoring the credit quality of the borrower, get a bad name, which in turn, can be proven very costly when carrying out transactions, in the credit derivatives market (Klausner et al., 1993). In general, credit derivatives could increase the liquidity and efficiency of products characterized by risk, through their ability to transfer risk and the separate risk assessment. Credit derivatives may also improve the price discovery process of credit risk (J. Kiff, R. Morrow, 2000). Regarding the standard-type OTC derivatives, the Regulatory Authorities, also, have to ensure that the Central Clearing Counterparties (CCPs) require significant safety margins (margin requirements) as well as other necessary risk controls. They have, also, to ensure that the bilateral OTC derivatives are not used solely as a mean to avoid the settlement through CCPs. For example, if an OTC derivative is accepted for

clearing by one or more CCPs, should be considered as a part of standard-type contracts and therefore a central clearing is required (Murphy, 2013).

As the International Monetary Fund (IMF) argues (IMF, 2004), there are plans for upcoming changes in the "*US law on Derivatives Exchanges*" and for the associated legislation to the transferable securities. The ultimate goal regarding the OTC derivatives, is to regulate them, further. With the use of OTC products (traded in a Regulated market, within the Market Abuse Directive's-MAD limits) and without the use of non-acceptable trading practices affecting the prices of securities, the perception of many investors, can be indirectly affected by the trend of these products. This is, mainly, due to the execution of derivative contracts with such products underlying, which include clauses much "unreasonable" for the market logic and the trend of these products. Therefore, the European Community legislation is somehow "forced" in every regulatory arrangements, to include with teleological sense, measures, which are related to both markets, (OTC derivatives Market and Secondary Regulated Market) (Panagopoulos, 2007).

METHODOLOGY OF RESEARCH

The present study aims to research, whether the existing regulations have contributed to strengthen the market, regarding the bilaterally traded structured financial products (CDS especially). All negotiations between European Union, International Swaps and Derivatives Association (ISDA), credit institutions and Hedge Funds, have also been studied. The need for additional regulation has already been examined, whether it is required and what could be additionally imposed and at what level for Hedge Funds, legislative speaking. Additionally, we investigated what prevails, for the time being, in Europe and the US. The key questions of the research work are: Credit derivatives can be put under further regulation and what will happen to the banks and Hedge Funds? Should Hedge Funds been additionally regulated? How this is coped by the current European and global legislation? The conclusions of the research, led us to a series of proposals, in order to strengthen the legislation system.

The research effort was based on the study of Hedge Funds as a source of investment opportunities for the capital markets, the economy and the banks. Banking activities (Prime Brokerage, structured products trading), as described in the International Bibliography, have been taken under consideration. European and international developments have been taken into account, regarding the regulation of credit products and Hedge Funds. Then, the risks faced by investors and banks (OTC derivatives, risks of Prime Brokerage, structured products), were analyzed and studied, as well as the current situation of the recent efforts to regulate OTC derivatives and CDS, at European level. As far as concerns the last issue, studies and surveys of International Organizations (ISDA, Bank for International Settlement (BIS), etc.), aimed, as well as, EU Directives and Regulations. The obtained results, conclusions and recommendations will be enriched, with our arguments regarding Hedge Funds' best practices, as well as with the impact of our suggestions for these products and Hedge Funds, in the European Market.

ANALYSIS OF CURRENT DEVELOPMENTS

Hedge Funds undertake risks, as any other fund, but there is evidence that Hedge Funds are not particularly risky, as shown in the following Table 1:

For example, 73.7% of the funds have lost more than 50% of their value, while only 10.2% of Hedge Funds have lost the equivalent. These figures, also, apply when we use volatility or other risk parameters. However, under absolute terms, Hedge Funds are less risky than shares. The first type of risk that is often mentioned, is the risk for investors. The sense of risk we have for Hedge Funds, probably results from their operational and fraud risk. However, the lack of a clear institutional framework creates more and general restrictions on Hedge Funds, regarding their operational practices (such as valuations, reports, risk management, etc.). The *lack of transparency*, also, creates risks for investors. We do not argue, however,

that Hedge Funds are a threat to the entire global financial system. This is because the market itself is able to produce protective solutions. Studies have shown that operational risks can be reduced, by the use of electronic platforms. The *arbitrage*, regarding the funds that banks must hold, may lead to a better allocation of capitals, but there is always a risk, that this activity can lead to an increasing risk profile of the bank. This is because banks are exempt from low-risk assets and hold more risky assets. The net effect of this activity (whether a bank holds much more or much less funds than it should) depends on how well the risk assessment model of each bank, works. Essentially, that means how accurate the model reflects the real risks of the entire loan portfolio, in relation to the fixed rate of the eight per cent on the book value of loan portfolio that should have to retain.

Table 1: Percentage of Funds, Which Have Lost Over a Specific Percentage of Their Value

Type of Funds	Loss > 10% of value	> 25% of value	> 50% of value	> 75% of value
Hedge Funds				
Funds of Hedge Funds	30.5	7.6	0.4	0.0
Single Funds	77.0	40.4	10.2	2.1
Mutual Funds				
Funds of Funds	100.0	93.1	69.6	4.9
Single Funds	99.7	97.1	73.7	5.1

The figures concern the period 2007 - 2013 on a monthly basis. Derived from the Database CISDM and Europerformance. The allocation of Funds in the table is the most common way to measure the risks of Hedge Funds. The table illustrates the worst possible loss an investor would invest in a fund in the worst possible moment, when he had the view of how dangerous the fund may be.

More specifically, if the risk model of a bank can assess more accurately, how much capital the bank should maintain compared to the simpler risk model proposed by the regulations, then the bank through arbitrage, can achieve a better risk-return balance, without any adverse effects. CDS products are the main part of the credit derivatives market. Since 1992, ISDA has designed a standardized agreement (ISDA's Master Agreement), which includes CDS and allows the counterparties of the agreement to determine in detail the exact clauses of the agreement and the transactions (for example, what would be considered as "default") among alternative definitions. Then (in 1999), issued a revised agreement for further standardization of terms and clarity and a more enriched agreement in 2002. However, there is not a single global standard agreement, but there is an agreement for the European market, one for US and one for the Asian. For the time being, banks and Hedge Funds execute these contracts/agreements bilaterally, in order to protect themselves legally, due to the lack of a single legislation framework, regarding the transactions and settlement of CDS.

This development in the standardization of the terms in the credit derivatives market, can be considered as quite important, as reduces uncertainty in legal terms, which was, initially, a barrier to the CDS market development. This uncertainty had been emerged due to the fact that credit derivatives, unlike other derivatives, depend on a *credit event* and not on a share price or on interest rates movements, which (the credit event) requires a fully covered legal documentation. The rest legal risks are associated to risk of impossibility of handling or liquidation of the guarantees (collaterals). Client bankruptcy is one of the highest risks, too. In addition to the international securities law and the conventional securities' offset procedure, Prime Brokers use modern techniques to pass the legal risk, in cases, where their customers go bankrupt. They use very special contracts ("*close-out-netting*" type) or other more generalized settlement contracts, even at the level of collateral management, so that, all extremely specific transactions to have a reduced risk exposure. We remind that we make the research in non-regulated market environments, which do not operate under commonly accepted rules of law. The existence of a bilateral (or trilateral) type of contracts offers the minimum legal support to counterparties.

Banks set different types of limits, so as to cover all types of risk: limits on denominations, limits on stress tests, even in criteria of monitoring risk derivatives (delta, vega). Additionally, they have set their capital requirements using not only the VaR methodology (the standard banking tool of allocating capital market

risks) but also using *stress tests* based on the worst loss case scenarios. Another risk associated to credit derivatives, and mainly the credit derivatives which has as underlying asset loans, concerns the *incentive of monitoring* bank loans. For every loan a bank gives, it monitors the credit quality of the borrower. But, if the bank buy credit protection using a credit derivative, the monitoring of the loan may not be as efficient as before. If the maturity of the credit derivative is prior to the maturity of the loan, then there will be no incentives for an efficient monitoring of the loan and the bank will be subjected to the risk of a possible credit default after the expiration of the credit derivative.

RESEARCH RESULTS, SUGGESTIONS AND DISCUSSIONS

Hedge Funds

We argue that Hedge Funds managers should develop a code of best practices in five areas:

Disclosure (investors letters, risk reports, performance updates),

Valuation (under a context in which a Valuation Committee will be included, in order to comply with the policy of the Fund Manager and to written valuation policies),

Risk Management (under a context in which the Fund Manager have to determine the risks of the portfolio and set measurements on the main risk categories),

Trading and Business Operations, and

Compliance, Conflicts and Business Practices.

For the upcoming regulation by the EU, we argue that, *the differentiation*, the definition and the practical application of Hedge Funds as investment vehicles is required, and whether it is adequate (this regulation) only at European level or not. We, also, suggest that the EU regulation should focus on the re-determination of the *systemic relevance* of Hedge Funds. However, even under this "indirect regulation rule" on their leverage (i.e., through increased requirements for the Prime Brokers), the strengthening of the banking system for the risks of collapse, is not guaranteed. We conclude, further, that the EU should decide on its regulatory agenda, the re-examine on whether the markets' efficiency has been affected due to Hedge Funds' reduced transactions (due to restrictions on *short selling*) and whether *short selling* has greatly affected stock prices. If this is the case, it could be set specific regulations only for Hedge Funds, than more general settings on abused practices.

The next important conclusion, we have reached, is based on the *internal structure* of Hedge Funds, mainly on the issue of risk management. A regulatory authority should design comprehensive codes of conducts and procedures in order to measure this risk. Therefore, this will be an important facility for the investors, concerning the transparency, control and the establishment of rules for the risk exposures of Hedge Funds under specific context and procedures. We come to the conclusion regarding the relationship between Prime Brokers (particularly as credit institutions) and Hedge Funds, that there is no need for further regulation, because the use of the current regulation and technical tools is considered that it can isolate a potential collapsing problem of Hedge Funds together with the banking system. However, in the case of further regulation, we must take into account the additional costs and the potential consequences of reducing liquidity due to Hedge Funds' avert. Even, in case of questioning of restrictions on the percentage of the leverage of Hedge Funds and on what they can achieve, (on the grounds that the counterparties and investors will manage the risk better), a significant matter of *mass movement* of Hedge Funds from Europe will arise, to other less transparent and regulated environments. What it is only required is that regulatory authorities have to obtain monitoring tools of systemic risk for the Hedge Funds.

CDS and Banks

It should be understood that the credit derivatives market is probably the only market which is "open". Practically, in such a market, anyone can probably assess the credit risk. Transparency in risk assessment in the CDS market, has greatly assisted participants, regulators and governments to curb the crisis. However, we argue concerning the CDS regulation, that a priority should be given to the concept of the real risk associated to the purchase of credit derivatives. While we are referring to the size of the nominal value, this does not reflect the actual risk. The size of the obligations of the credit derivatives market has been estimated on about \$4 trillion, approximately 10-15 times less than the size of the bond market. Besides, CDS are "zero-sum" products, because the counterparties have equal and opposite exposures in the changes of the "price" of the credit risk of an entity. The forthcoming EU legislation should take into account that the credit derivatives market is armed with capable tools for risk management. As ISDA argues, using the mechanisms of the *close-out* and *collateralization* (through ISDA agreements), counterparties can manage their exposure to risk. The aforementioned number of obligations is half-covered by guarantees and mechanisms for credit events manipulation (*ISDA cash settlement mechanism*). We estimate that, the requirements for further regulation of credit derivatives will result in changes relating to: transactions, technology issues, clearing, overlapping regulator authorities, financial system functional changes and the development of more standardized ISDA agreements (with *standard clauses*). The agreements developed by EU (*European Master Agreements*), regarding the bilaterally traded OTC derivatives will be affected, too.

As far as concerns the standardized and non-standardized OTC derivatives, we argue that, the need for the establishment of CCPs, is inevitable and *regulated reporting systems* should be designed. These reporting systems (platforms) will be able to manage large volumes of data and transactions of open positions, make them available to the public and to the national regulatory authorities. The last, requires the establishment (or the assignment) to a national (or private) body, but with technology, manpower and regulation costs. Under this way, we argue that, the market efficiency will be improved as well as the transparency of the prices, particularly in derivatives market, because the next step will be the transfer of the standardized contracts of these "OTC" derivatives (since they can be centrally cleared) in Market Exchanges and not only to unregulated electronic trading platforms. Alternatively, these standardized derivatives could be traded in *electronic trading OTC platforms*.

We argue that, such a system can exist, with prime brokers, Hedge Funds and banks as counterparties, where there will be a continuous flow of transactions and reports, as well as direct price references and other information and on-line connection with data vendors and information providers platforms (Reuters, Bloomberg, etc.). We believe, that these systems have to be designed with the logic of a "*price/quantity driven*" logic. The involvement of financial institutions in these systems should be encouraged under the reasoning, that their competition will be increased, as well as the offer of a higher level of service to their clients. We, also, conclude that regarding the issue of the *systemic risk regulation*, the establishment of much more powerful systems will be required, in order to measure the risk. To achieve this, more information will be required, by Hedge Funds particularly, in order the identification of credit risk to be more accurate and reliable. Moreover, regarding the risk management performed by banks, many tools will, also, be required, as well as daily reports of the margins and guarantees, and reports on liquidity for wide exposures and significant changes in trading portfolios, (i.e. for large buy-backs of Banking Notes, etc.). These changes will probably affect all market participants (Banks, Hedge Funds, Prime Brokers, etc.). However, it should be noted, that the most important tool regarding the regulation for the excessive leverage and in other areas of risk undertaken in the market, is the *discipline of investors, counterparties and creditors*.

Other Reforms

Regarding the “short selling” issue and its forthcoming regulation, we conclude that, it has been shown that the market liquidity has definitely been reduced after recent restrictions (since October, 2008). Therefore, we conclude from our survey that any further regulation should take into account, the special conditions of each market, given that since the beginning of the application of measures (in terms of pricing), the *shares spread* has been affected in each case (on average, has been widen). Additionally, we have to underline that, the use of shares spread should not be confused with the market abuse. ISDA is explicit that no specific restrictions on the application of short selling from Hedge Funds, should be imposed. Besides, Hedge Funds are, in any case, obliged to comply with the short selling technique (for equities or debts) regarding market abuse practices, under the Market Abuse Directive (MAD).

We conclude as a proposal, the *separation* of the responsibility for monitoring of the aforementioned proposed regulation reforms by the respective supervisory authorities. At this point, we must realize that Central Banks of the member states and their respective Capital Markets Commissions will play an important role. For the first time, appears a potential overlap of responsibilities, because credit institutions (supervised by Central Banks) will engage in transactions involving standardized products of a regulated market, in which will be set rules of law (even in alternatives markets, as MiFID (Markets in Financial Instruments Directive), provides). The overlapping responsibilities should be resolved under cooperation between the supervisor authorities and with separate responsibilities. The establishment of a new supervising body (at National and EU level), is a solution to this. Finally, we have reached to the conclusion that the establishment of *joint committees* or European Supervisory control bodies or other mechanisms is a solution (which in turn requires higher technological infrastructures and clearly high cognitive level personnel). The reasoning for the cooperation of the two markets (OTC and secondary regulated) is dominated by the "unified" logic for the *satisfaction and protection of the investor* and its faithful operation, even at bilaterally market level.

CONCLUDING COMMENTS

Due to the risk management of financial institutions, which does not seem that operate successfully, Central Banks should monitor the exposure of commercial banks to creditors, who lend Hedge Funds. There must be a systematic communication and information between Central Banks, as proposed by the Basel Committee on the basic principles for banking supervision (Core Principles for Banking Supervision). In several countries (England, USA) Hedge Funds are subjected to special regulations, which have been designed to be able to detect when individual persons involved in the market, try to dominate and twist it, in such a way, as to gain net benefit for themselves. In our opinion, the goal of regulatory policies is to *prevent* the systemic risk in the financial system, among others. In these cases, the policies should include high margin requirements, collateral requirements and risk exposure limits for the private investors. Regarding USA, Hedge Funds do not operate as registered investment companies (up to this moment) with the Securities Exchange Commission. Investment companies are subject to strict regulations, regarding "short sales" and the leverage of funds.

Hedge Funds can not offer guaranteed returns, can not be advertised in major newspapers and their investors must meet certain standards and criteria. The most recent event that has occurred is the mandatory registration with the SEC of their investment managers. As far as concern the European Commission (EC), it does not include any Hedge Funds Indicators in the category of UCITS and the European Securities and Markets Authority (ESMA) also agrees to it (i.e. Hedge Funds Indicators not to be disclosed to European Commission). While ESMA has proposed to allow derivatives in economic indicators based on eligible assets, as well as indicators to real estate, however, given the complexity of Hedge Funds, does not recommend that the Hedge Funds Indicators to be considered as proper economic indicators for the UCITS. We argue that, the European Commission should *expand the dialogue* between the EU and US for the aforementioned financial changes, working closely with international organizations (IOSCO, BIS, ISDA, European Banking Authority, etc.) not only for the financial sector, but also with other countries (Japan, Russia, China, etc.). At the same time, EC has to increase its powerful representation in international

organizations and fora, through which must be expressed under a single opinion in the fight against financial crime, money laundering, corruption in the financial sector, corporate crime, etc. There is need for collaboration and information exchange, even between offshore financial centers. The solution is on the rationality of the Law for the prevention and combating money laundering and the reintroduction of sanctions in the context which the sober assessment of the worthlessness of the act dictates, based on *the principle of proportionality*. This paper, finally, recommends and concludes, substantially, the *aligning* of the national regulatory approaches to a common European and International regulatory system, which represents a real challenge, as it involves significant initial costs for adapting the national law enforcement authorities and market operator bodies. These transitional problems are in themselves a challenge - especially to the extent that focus on a short period. Therefore, there is need for additional research on it.

IDENTIFICATION OF INNOVATION CAPABILITIES FOR MICRO AND SMALL ENTERPRISES IN MORELOS, MEXICO

Mayanyn Larrañaga Moreno, Universidad Politécnica del Estado de Morelos
María Teresa Ortega Flores, Universidad Politécnica del Estado de Morelos

ABSTRACT

“Innovation” is usually associated with the use of new technology or with important research and development departments, leaving micro and small enterprises (MSE) out of place. After this research we have found that MSE can find success by doing things differently, better, quicker and more cost efficiently. Unfortunately, their innovation level is hard to be evaluated since most innovation models have been developed for medium and big enterprises. This paper main objective is to determine the indicators that can be efficiently used to measure innovation in MSE in Morelos, Mexico dedicated to service and commerce activities. To achieve this, three innovation models were analyzed: “Innovating for the next three billion” report by Ernst & Young, “Measurement of basic processes and innovation enabling” and “The Innovation Kite Model”. From this analysis, and after the identification of the characteristics and needs presented by the Mexican commerce and service MSE, we established 12 innovation capabilities to measure their innovation level. The above will be part of a sectorial study in which the innovation level of MSE’s will be actually measured in order to propose and implement strategies that will lead into more successful business models.

KEYWORDS: Innovation, Micro and Small Enterprises, Innovation Capabilities

INTRODUCTION

Innovation is a topic that has acquired high importance for business and the way enterprises manage challenges in developing new products and services, improving their processes and management in order to offer added value to their customers. Innovation is easy to be done when enterprises have enough resources, but when resources are limited things get difficult. Micro and small enterprises (MSE) have this problem that is why the question is: Micro and small enterprises are not able to innovate? Answering this question is the main reason for the present research. The situation of a specific sector of commerce and service enterprises from Morelos, Mexico is going to be analyzed to know how innovation is possible even for MSE. The innovation level for MSE of commerce and services sectors is difficult to be evaluated because the evaluation criteria can be applied to bigger enterprise that have more resources and activities related with research and development, high level of technology and other factors that MSE cannot easily obtain. The research problem is: “The innovative capabilities that can be applied to MSE are not defined, that is why the evaluation of innovation for the characteristics and needs of this specific sector is difficult to be done”.

LITERATURE REVIEW

Commerce and Services Micro and Small Enterprises in Morelos, Mexico

The small and medium enterprises in Mexico represent an economic force for the country. According with information of the Instituto Nacional de Estadística e Informática (INEGI), a national organism responsible of statistics, in Mexico exist approximately 4 million 15 thousand of entrepreneurial units, of which the

99.8% are micro, small and medium enterprises that generate 52% of the GDP (Gross Domestic Product) and 72% of employment. (ProMéxico, 2014) With the information provided by ProMéxico, some advantages of MSE in Mexico can be distinguished: they are a source of development for the country, their recently born organizational structure is flexible so modifications and adaptations can be easily made to their processes, they have growing opportunity, they take a large percentage of the economically active population because SME generates a large amount of jobs. Mexican MSE contribute to local and regional development. The owners are frequently the managers of the enterprises so they are aware of the needs of the business. Finally, MSE can easily assimilate and adopt new technologies. (ProMéxico, 2014) On the other hand, some disadvantages are related with administration issues, frequently, MSE do not reinvest profits to upgrade their equipment and production techniques. The lack of an efficient organization results in a shortfall of sales and providing inefficient service to customers. MSE do not know how to set prices for their products or services because they do not distinguish all the costs involved, lack of inventories control, taxation problems, among others. All these problems can be translated into affectations when these enterprises intend to request financing from government of financial instances. (ProMéxico, 2014)

Morelos officially named “Free and Sovereign State of Morelos” is one of the 31 states which, with the Federal District, comprise the 32 Federal Entities of Mexico. It is divided in 33 municipalities and its capital city is Cuernavaca. It is located in South-Central Mexico. It is bordered by the states of México to the north-east and north-west, Puebla to the east and Guerrero to the southwest. Mexico City is situated north of Morelos. This state is the second-smallest state in the nation. Commerce, transportation, services and tourism accounts for 59% of the state’s GDP and employs just over 50% of the working population. The growth of the commerce sector is due to urbanization and the growth of tourism. (INAFED, 2010)

What is Innovation?

Innovation has become an imperative for enterprises of any kind and size, the changing environment in all aspects lead the enterprises through the search of new ways to offer their products and services, innovating in those that already are offering, processes’ and management improving, trying to access new markets, among others following the path to create value and keeping a competitive advantage. Innovation must have an identified purpose to be strategic; this will make implementation easier and opens the possibility to take advantages of the opportunities, when the purpose is perfectly differentiated. Innovation has been defined in several ways, for this research some of them are mentioned to use them as reference framework.

Innovation is related with something new and also needs to be useful. The Organization for Economic Co-operation and Development (OECD) in the Oslo Manual, defines innovation as “the implementation of a new or significantly improved product (good or service) or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations”. (Organization for Economic Co-operation and Development, 2005) According to Schumpeter, innovation goes beyond technology, the definition Schumpeter proposes, covers the following cases:

The introduction of a new product into a market.

The introduction of a new production method.

The opening of a new market in a different country, even though if that markets already exists in another country.

Find a new source of raw material or semi elaborated products, without consideration if that source exists or has to be created.

Implementation of a new structure in a certain market. (Escorsa Castells & Valls Pasola, 2003)

Creativity is related to innovation, the creativity concept includes processes about idea generation; innovation includes processes about practical appliance and the exploitation of those ideas. Creativity is present in MSE, a lot of these enterprises have their origin in a brilliant idea, and the lack of resources often makes the entrepreneurs creative. Now, what these enterprises have to develop is the ability to transform the ideas in a product or a service that can be the source of profits for them. (Asociación de la Industria Navarra, 2008) The generation of added value is produced through something new which is transformed or incorporated in products, services, processes, systems, structures, brands, among others in something that the customer is willing to pay. Then, innovation is seen as the sum of invention and commercialization. (B+I Strategy, 2007)

Finding innovation sources for all kinds of enterprises is important. The most common sources of innovation opportunities in organizations are processes and customers. Opportunities of innovation based in the needs of customers can generate more value for the organization; these can help to launch new products or services. An enterprise that fulfills the needs of customers can achieve better profitability. In processes it is also an opportunity to improve how things are getting done, save in resources and gain in quality and performance. (Bermúdez García, 2010) Innovation definitions have in common the element of being successful in a market. If the new products, procedures or services are not accepted by a market, innovation does not happen. Innovation implies competitiveness. Innovations become an attribute to generate value. Innovation's goal is the improvement of the results of an organization through the obtaining of competitive advantages.

MSE and Innovation

Innovation measurement in enterprises must be done according to their own characteristics. There are clear obstacles faced by MSE when innovation looks forward to the generation and patenting of new processes and products through considerable investment in infrastructure, high fixed costs, specialized knowledge, etc. Although these obstacles reduce the options for these enterprises to generate new knowledge there is still, a whole universe of gradual improvements and tacit knowledge that could be used by these enterprises to reach new levels of competitiveness and productivity that enable them to grow and develop. According to Dini and Stumpo (2011), there is a need to focus into three elements that should be considered in SME (small and medium enterprises) innovation policy design as well as research projects:

SME adopt innovation strategies (informal ones) different from the ones developed by big enterprises. The efficiency of these strategies depends on the competitive context in which they operate.

SME capacity to efficiently relate with the economic and institutional environment affects significantly their informal innovation strategies.

SME access to more formal innovation processes may be facilitated by promoting their links to other economic organizations that do not experiment their scale limitations.

(Dini & Stumpo, 2011) The innovation strategies that are called informal can be transformed into formal by providing a definition of the capabilities in which MSE can innovate. MSE relate with external instances such as their customers, other enterprises and the government, all of them can be innovation sources.

Types of Innovation

In Mexico, since 2006 the Economy Ministry promoted enterprises' public organizations to create an organism called Foundation Innovation and Technology National Award in order to operate and manage this program to promote the participation of economic entities in the development of technology and

innovation and as an incentive for promoting successful processes in the topic. Some of these public organizations are CANACINTRA (National Chamber of Transformation Industry), ADIAT (Mexican Association of Applied Investigation and Development Directives), FUMEC (Mexico – US Foundation for Science) and FUNTEC (Mexican Foundation for Innovation and Technology Transfer in Small and Medium Enterprises). (Premio Nacional de Tecnología e Innovación, 2014)

The Economy Ministry has developed the National Model of Management of Technology and Innovation which has as main purpose to enhance the development of Mexican organizations of any activity and size to help them to reach competitive levels through an explicit, sustained and systematic management of innovation and technology. This Model differentiates four types of innovation: product, process, marketing and organization according with the Oslo Manual.

Product innovation: It is the introduction of a new or significantly improved good or service, in its characteristics or usage. Product innovations in services can include significant improvements in the way these services are given such as efficiency or speed, the addition of new functions or characteristics to actual services or the introduction of completely new services.

Process innovation: The introduction of a significantly improved production or distribution process, this implies changes in techniques, materials or information systems. Methods of creation and provision of services are included, also significant changes in equipment or systems used by enterprises or in procedures and techniques to give these services to customers. Supporting activities as purchasing, accounting or maintenance are considered innovation in processes.

Marketing innovation: Applying new methods in commercialization that implies significant changes in design or packaging of a product, its market positioning, promotion or pricing. The introduction of a commercialization method which application is new for a specific enterprise can be considered as innovation too. The method can be adapted from other enterprise or organization. The first usage of a new method that allows changing the price of a good or service based in the demand or in the desires and need of the customer is also considered innovation in marketing.

Organizational innovation: Is the introduction of a new organizational method in practices or in the organization of the workplace or in the external relationships of the enterprise. Organizing routines and management procedures of work, improvements to the supply chain, restructuring activities, demand based production and application of quality systems are examples of this kind of innovation. The first time usage of new ways to establish relations with other enterprises and with the government, new ways of collaboration with customers, new ways of integration with suppliers and first time outsourcing, are included in organizational innovation. (Organization for Economic Co-operation and Development, 2005)

Innovation Models

After literature research, it can be found that innovation models have been developed in order to identify the indicators that enable the quantitative measurement of innovation activities in economic organizations. In this paper, three specific innovation models are examined:

“Innovating for the next three billion” report by Ernst & Young.
Measurement of basic processes and innovation enabling.
The Innovation Kite Model

“Innovating for the next three billion” report by Ernst & Young.

Ernst & Young in their report named “Innovating for the next three billion” emphasize the importance of entrepreneurship and the contribution of small and medium enterprises to the growth of markets around the world. In this report, it can be read that innovation is more than R+D activities, to meet the requirements of quality, affordability and access, companies should be prepared to rethink their entire business and operating models. They should build new relationships with stakeholders across the supply chain, seek out new distribution channels, and develop an intense focus on operational excellence to bring down costs and increase efficiency. (Ernst & Young, 2011) This opens the possibility for MSE to innovate even if they do not have enough resources to develop R+D activities. The activities just mentioned are accessible to these enterprises respecting their size and characteristics. Ernst & Young describe an innovation model with local and global approaches. The model includes four perspectives to be met in innovation. In the case of MSE, if they reach the local approach is a very important step to see innovation as a path to be followed.

Customer insight. The customer need have to be understood and requires resources in local markets. First of all, observation is an important tool to take note of the existence of potential customers. The next step is engaging customers and treating them as partners and collaborators in innovation.

Research and development. The R+D activities need to be carried where the customers are located. Trying to develop a “reverse engineering” approach turns R+D affordable to think in new products and services. New ideas need to reach the decision-makers to be practical.

People and culture. Talent and expertise of the people in enterprises are a key element to innovation. The power of decision making related in recruitment, in translating customer needs into new services or products, the possibility of assign rewards to embed responsibility to ensure managers’ accountability are elements too that allow the people working in the business to be engaged with innovation.

Operations and business model. Try to identify local partners to help build a value chain. Make operations as efficient as possible in order to lower costs and maintain profit margins. The needs of the customers have to be observed to ensure appropriate policies of pricing. (Ernst & Young, 2011)

Measurement of basic processes and innovation enabling.

Basic processes in the enterprise need to be followed by implementing a set of appropriate measurements. Chisea et. al. quoted by Pervaiz (2010) propose an audit tool for this purpose. The use of this tool increases the capability of the enterprise to satisfy strategic and tacit objectives of the business. It will be possible to verify improvements in the execution of processes which are fundamental to generate innovative results. The basic processes and their measurement are listed below:

Enabling Processes

Leadership. The measure of performance and agreement that indicates that the innovation is working in an effective way.

Systems and structure. Effectiveness of the organizational structure and infrastructure support to satisfy the needs of the enterprise.

Resources. Degree in which the available resources satisfy the demands of product or service development, financing sources are important this classification.

Basic Processes

Definition of the concept. Efficiency in the innovation process that generates ideas for commercial success.

Product development. Efficiencies associated with the fact to take the concept to the market.

Technology acquisition. Degree in which technology is brought instead of being developed internally.

Process innovation. Effectivity related with continuous improvement inside the enterprise.

Production efficiency. Management of costs and the way products or services are delivered.

Performance Indicators.

Customer's acceptance. Success in customer's recognition of the value of products or services.

Financial performance. Financial success product of an effective investment and execution in products and services development-

Organizational maturity. Joining to legal certifications, industrial regulation in order to compete efficiently in the industry. (Pervaiz, 2010)

The Innovation Kite Model

B+I Strategy is a Spanish consulting firm that its main business is helping other enterprises to innovate, by developing research projects focusing in networking with stakeholders by acquiring, interchanging and generating knowledge. In 2007 B+I Strategy issued a publication called "El Cometa de la Innovación" ("The Innovation Kite") to present the results of a Research Project about Strategic Innovation. Product of the research made by the firm is a model called Modelo de Innovación Estratégica "La Cometa" (Model of Strategic Innovation "The Kite"). The Model has two main elements related and complementary:

WHAT: In which innovative businesses the enterprise is working on and the differential components that offers. It includes a global vision of a flexible and dynamic enterprise with strategic guides to innovation. The enterprise develops new ideas and experiments for innovative businesses.

HOW: How to develop a constant innovation capability in the enterprise. This is about generating the context in which the activities (WHAT) may work out. Some elements are: leadership and culture, people's management, external relationships, organizational structure, management processes and indicators to assess the management. This Model represents the environment (market, technical, institutional), competitors, customers, government and other external agents that enable collaboration opportunities. The model changes as the environment do, adapting to new circumstances and innovation activities of the enterprise. The last element is people in the leading role of innovation; they have the responsibility to develop an innovative culture, supported by a management model to assure their training, rewards systems, resources, among others. (B+I Strategy, 2007)

METHODOLOGY

The research will have a qualitative approach. The qualitative phase is about finding the characteristics of commerce and services micro and small enterprises in Morelos. Then define the innovative capabilities that can be found in these enterprises. This paper shows the literature review to find the innovative capabilities and how they are adequate for micro and small enterprises (MSE). The following general and specific objectives and hypothesis were built for the whole research that is going to be developed and are mentioned to have a complete context of the whole research.

General Objective

Determine the innovation capabilities in MSE of the commerce and services sectors and how to measure them.

Specific Objectives

Define the characteristics of the MSE of the commerce and services sectors.

Select the innovative capabilities and their indicators that can be applied to MSE of the commerce and services sectors.

Design an evaluation instrument to measure the innovative capabilities and apply this instrument to a specific sample of enterprises of Morelos, México.

Hypothesis

“Determining the appropriate innovative capabilities for MSE will allow the measurement of innovation level for this specific sector of enterprises”.

RESULTS AND DISCUSSION

Innovation Capabilities for Micro and Small Enterprises

After reviewing the three previous models which analyze the innovation characteristics that can be evaluated in actual enterprises, and in the other hand, the characteristics of the study object (Mexican MSE), we are proposing for the future research in Morelos Mexico, the following innovation capabilities to be measured in Micro and Small Enterprises:

Good / Service: MSE can innovate in the product they deliver to their target market. The characteristics of this product can be turned in their competitive advantage. Many of these enterprises before beginning operations have already observed a specific need or desire to fulfill.

Characteristics: New features of goods or services and how often are implemented.

Variety: More than one good or service to meet needs of a certain target market.

Market: Actual and potential customers.

Promotion and advertising strategies: new ways to reach the market and how often are implemented.

Market segments: identify new market segments and how often this aspect is diagnosed.

Distribution channels: new distribution channels that enhance efficiency and speed in the delivering of the goods or services.

Customer interaction (relationship): Measurement of the customer satisfaction and implementation of improvements in this area.

Processes: How goods or services are produced.

Supply chain: Finding new material resources in order to reduce variable costs.

Use of technology: Implementation of new technology resources, such as internet, information systems, social media, machinery and equipment.

Formalization: Process documentation to ensure the quality of goods and services.

Organization: How resources are oriented to achieve innovation objectives of the enterprise.

Source of economic and human resources. New recruitment methods, implementation of incentive and rewards systems, new training programs and finding new funding sources.

Effectivity of organizational structure: Improvements in activities' distribution.

Decision-making process: New sources of information to improve the decision making process.

CONCLUSIONS

Micro and small enterprises are entities that represent an important source of growth and development for the economies of our Latin American countries. Therefore, all the tools available for their consolidation are useful. Innovation can be present in any business despite its size and activity. The models of innovation presented in this paper help to identify the capabilities that are appropriate for MSE and propose a new one to assess them. First of all, innovation has to be strategic, it needs a purpose based in the mission of the enterprise, and defined objectives make easier the implementation of innovative actions. People are a key element to innovation; the owners of the MSE have to be the leaders of innovation inside their businesses to identify the opportunities to innovate. Taking the right decision through reliable information is also a responsibility of these enterprises' leaders.

MSE more than any other type of enterprises have to be aware of the environment, the behavior and response of the market are key elements too and offer innovation opportunities. MSE enterprises are quite adaptable and flexible. They have to realize the importance of innovating and besides implementing actions toward innovation a constant evaluation has to be done. This is the main reason for developing a model of innovation capabilities for micro and small enterprises; they cannot be evaluated as big enterprises, because even small efforts count to be innovative. The indicators that are included in each area of innovation are going to be graded for a sample of MSE of the commerce and service sectors in Morelos, Mexico to identify the degree of innovation in this specific sector. The innovation capabilities presented in this paper are the first phase of a complete research, future work will be done to present the state found in this specific segment of enterprises.

STRATEGIC PRIORITIES AND PERFORMANCE MEASURES IN KING SAUD UNIVERSITY, SAUDI ARABIA

Abdullah H. Al-Dakhil, King Saud University
Abdulhakim A. Al-babtain, King Saud University

ABSTRACT

The Strategic plan of King Saud University (KSU) started on 2008, to cover 20 year. Now the plan is implemented under the theme KSU2030. Before 2008 KSU was not listed according to Academic Ranking of World Universities (ARWU), which ranks the world's top 500 colleges and universities based on certain indicators. In 2014, KSU is ranked 157 in this classification. This means that KSU2030 success to rearrange the KSU priorities. This is clearly illustrated in KSU vision "To be a world class university and a leader in building the knowledge society". KSU2030 has 9 priorities areas, these priorities focus on excellence in certain areas, changing KSU from learning university to research university, the second priority concerns is attracting distinctive faculty members. Third and fourth priorities focus on Student learning outcomes and recognition of students for the important of research and creative contributions. Priorities 5-9 focus on building relation, environment, accountability and organizational structure. The above 9 objectives has helped KSU to be the number one university in the Middle East region according to the ranking mentioned above. The execution of KSU2030 according to KSU priorities has helped KSU's decision makers to drive & achieve KSU vision and mission. Key performance indicators (KPIs) are measured systematically and balanced scorecard is used as a tool to monitoring the desired outcomes.

The university's strategic mandates are measured by performance of data shown for the following priorities:

Achieving excellence in 9 main areas; health care, education and learning, finance, insurance, management, ICT, petrochemicals, water resources development and management, urban planning and future technologies.

Student learning outcomes, that include academic program review university-wide and specialized accreditation.

Building relation with community and twinning programs with with international universities.
Recognition of faculty and post- graduate students for research and creative contributions

Enhancing students to involve as volunteers to improve their skills and increase their participation in community programs

Increasing faculty and staff satisfaction and reducing attrition.

Expanding programs and activities to improve student skills beyond the classroom and laboratory.

Enriching opportunities for social networking among students and faculty members

Engaging university leadership, faculty, staff and students in regional initiatives and vice versa and enhancing indoor and outdoor space for teaching and learning.

Making and implementing decisions rooted to our institutional values based on data analysis and maintaining currency and reliability of information infrastructure.

Improving space utilization and increasing customer satisfaction

Moreover, we are working on risk management policy, code of conduct and academic freedom.

THE IMPACT OF MOTIVATION ON EMPLOYEE PERFORMANCE

Nkafu Fondu Fomenky, Soongsil University

ABSTRACT

The purpose of this paper is to identify the impact or role of incentives on employee's performance with a particular emphasis on Korean workers. The process involves defining and explaining the different types of motivation. In defining them, we also bring out the difference between the two major types of motivations. The second phase of the paper shall involve gathering data/information from a sample population and then analyzing the data. In the analysis, we shall get to see the almost similar mentality or value which Koreans attach to motivation, which a slide different view coming only from top management personnel. The last phase shall have us presenting the data and coming to a conclusion from which possible knowledge on how managers and potential managers can ignite the best out of their employees.

KEY WORDS: Motivation, Employee's Performance

INTRODUCTION

There are number of views of literary personalities relating to motivation and motivational theories. Content theories give us a lead to know about people's needs and the things which are necessary for motivation work. We shall take a look at one in order to give us an idea of what motivation is all about; Maslow's-Hierarchy of Needs Theory Abraham Maslow said that five universal needs motivate a person. He arranged them as:

Physiological or Basic Needs

According to Anyim (2012) physiological or basic needs are the basic need of a person. It includes as driving force. This is also called felt need. This need causes physiological tension which is shown by any body's behavior. This can be reduced by eating something. Chintaloo and Mahadeo (2013) also explain physiological needs. According to them physiological needs basically is satisfied the basic need of human. Physiological needs or basic needs also called biological needs. Maslow said when a person fulfills the basic, physiological or biological needs him move up the next level. For example: Food, shelter, clothes, sleeping and breathing etc.

Safety Needs

Safety needs is the needs for shelter and protection. In this need a person needs security, stability and dependency. In this a humans needs freedom from anxiety law and order and structure. This need is also called security needs. For examples the employee's or the worker's in a private organization demand that the organization or company must be provide their job security, health security and promoting safety. And nowadays private organizations also provide the promoting safety and health plan, and emergency fun and accident cover's benefits.

Belongings Needs: These needs are also known as social needs. It includes love and belongings. Usually man's needs love and care. These needs can be fulfill by interaction with coworker and colleagues. For example the feelings of friendship, feelings of love, caring of family or relative etc. At work, having a good relation with group fellow or colleagues. For promoting the team work and achieving the organizational goal the managers could force the workers that they must be works in groups or in a team.

Esteem Needs: Esteem needs are also known as egoistic needs. In this a man needs self-respect and the esteem of other. Man needs or reputation, prestige, status, fame, glory, dominance and recognition etc. Esteem needs are difficult to satisfy in some industries. In an organization a manager should be respectively treat their employees. And the workers should also respect the policies or the law of the organization. The worker's also respect each other. Example of these needs is the achievement and confidence.

Self-actualization Needs: This is the highest need. A man wants self-realization and self-development and desire to be able to do something. Morality, acceptance of facts, lack of prejudice, creativity, spontaneity and problem solving are all examples of self - actualization needs.

Purpose of the Research

Identify the factors that affect employee motivation.

Examine the relationship between organizational effectiveness and employee motivation.

To examine whether motivation is a determinant factor influencing workers performance.

Create a causal relationship between motivation and workers performance.

RESEARCH METHOD

Sample: A sample of 50 people was taken from workers from different companies here in Korea. Workers were chosen irrespective of their position in the company. The respondents were given questionnaires which they filled with the use of a pen. Among the 50 respondents, 35 were male and 15 were female.

The study used a descriptive survey design to collect detailed data that describes existing phenomena. Data was collected based on the concepts defined in the research model and hypothesis tested. This study is descriptive survey because it adopted the use of questionnaire aimed at finding the impact of motivation on employee performance.

HYPOTHESIS

The hypothesis here is that, is workers performance is a function of how motivated they are to do their job. There are basically two types of motivation, extrinsic and intrinsic motivation.

Extrinsic Motivation: occurs when we are motivated to perform a behavior or engage in an activity in order to earn a reward or avoid a punishment. Examples of extrinsic motivation include;

Studying because you want to get a good grade

Participating in a sport in order to win awards

Competing in a contest in order to win a scholarship

Intrinsic Motivation: involves engaging in a behavior because it is personally rewarding; essentially, performing an activity for its own sake rather than the desire for some external reward. Examples of intrinsic motivation include;

Playing a game because you find it exciting

Participating in a sport because you find the activity enjoyable.

So, the primary difference between the two types of motivation is that extrinsic motivation arises from outside of the individual while intrinsic motivation arises from within. In order to test the hypothesis, three (3) questions were advanced to represent the hypothesis with the help of tables.

Table 1: Does Incentives Motivate You to Perform Effectively Towards Achieving the Company's Goals and Objectives?

S/N	Respondents	Frequency	Percentage
1	YES	50	100%
2	NO	0	0%
	TOTAL	50	100%

Table one shows that all employees of employees of the various Companies, irrespective of their position at their companies believe that motivation is a basic aspect that can energize them to be productive and committed. The study shows that out of the 50 workers sampled, 100 percent of the respondents said yes, confirming that our hypothesis is upheld by the workers responses showing the effectiveness of motivational incentives from the workers point of view.

To add weight to the hypothesis, another table is initiated to understand the variety of incentives they deem necessary to motivate them.

Table 2: Which of the Below Rewards Motivates You Most?

s/n	rewards	frequency	percentage
1	SALARY INCREASE	30	60%
2	PROMOTION	10	20%
3	PERFORMANCE AWARDS	5	10%
4	MOTIVATION TALKS	1	2%
5	LEAVE	4	8%
	TOTAL	50	100%

From Table 2 above, we notice that a majority of the respondents, 30 respondents who represent 60% of the sample population prefer an increase of salary, 10 respondents who represent 20% of the sample population prefer promotion on their job. 5 respondents who represent 10% of the sample population will prefer performance awards while just a single respondent representing just 2% of the sample population said she will prefer motivation talks and 4 respondents who represent 8% of the total sample population will like to take a leave in order to be motivated to perform their job well. In order to establish the causality between motivation and employee performance, we need a third table which seeks to find what the effect will be on employee performance if there is no motivation.

Table 3: Will the Absence of No Form of Motivation Lead to Poor Performance At Your Job?

S/N	Respondents	Frequency	Percentage
1	YES	50	100%
2	NO	0	0%
	TOTAL	50	100%

From table 3 above, we notice that all 50 respondents who represent 100% of the total sample population uphold the fact that the absence of motivation will lead to poor performance at their job.

DISCUSSION

The hypothesis which states that workers performance is a function of how motivated they are to perform their job was accepted. This shows that motivational incentives given to workers organizations have a significant influence on the workers performance. This is also in line with the theory that rewarded labor produces more than unrewarded labor. Another work that this findings can be said to have corroborated is the work of Eze (1985) whose investigation on Nigerian management personnel shows that 90 percent of managers in his sample regarded their work as a means to end. And these ends were interpreted to include money, material possessions etc and the reason may be that workers need to take care of themselves, their

families and other dependents and provide themselves other basic needs of life. The Findings also agrees with the works of Berjum and Lehr (1964) and Ajila and Abiola (2007) which showed that workers who received incentives performed better than those who did not receive. And workers exhibited productive work behavior when motivational incentives were made contingent upon performance. The works of Akerele (1991) can also be said to have corroborated the findings of this study. He observed that poor motivation in relation to profits made by organization, where differentials between high and low income earners among others things contributed to low morale, lack of commitment and low productivity. Whether it is extrinsic or intrinsic motivation, employees generally want to have the feeling that whatever they are doing is being recognized, and a good way to recognize their efforts is to appreciate them for the job done. From the above analysis, they employees in these Korean companies will prefer an increase in their salary compared to any other form of motivation.

CONCLUSION

The above results show that employees are more geared to have a very productive attitude when their labor is been rewarded. In most cases, they wish to get rewarded financially more than getting leave or having motivational talks. Some need to get promoted to higher management positions. For them that is a great deal of recognition for a job well done and also a good motivator. It is therefore of paramount importance that companies should have very good motivational strategies in place in order to get their employees at maximum productivity. They tend to value their pay packages more than the relationship they have with other workers at the company as a major motivator for on the job performance.

THE ROLES OF SOCIAL INFLUENCES, LIFESTYLES AND EASE OF USE IN ADOPTING SMS ADVERTISING IN EGYPT

Fouad Luxor, University of Arab Academy for Science, Technology and Maritime Transport
Heliopolis (AASTMT)

ABSTRACT

This study examines the role of social influences, lifestyles and ease of use in adopting SMS advertising in EGYPT. The nature of the study required the use of mixed methodology where in-depth interviews and large-scale questionnaire were used to collect data, as a result both themed and quantitative analyses have been used and they have yielded to significant outcomes. Based on the in-depth interviews and a probability sample of 398 respondents from Egypt's two most prosperous cities (CAIRO and ALEXANDRIA), the results show that the respondents tended to integrate SMS into their conspicuous and socially active lifestyle. Adopting SMS advertising is found to be a way to achieve social differentiation and identity among lifestyle segments. The study demonstrates the utility of segmentation analysis in delineating complex relationships among social influences, lifestyles and ease of use in adopting SMS advertising in Egypt. In order to provide a broader view of social influences and lifestyle impacts on adoption of consumer technology products, future research could extend the findings by examining additional social influences, lifestyle and ease of use factors relevant to consumer technology products.

KEYWORDS: Adoption, Ease of Use, Lifestyle, SMS Advertising, Direct Response Marketing Social Influences

INTRODUCTION

This study will be focusing on three main variables that might be affecting the adoption of SMS advertising in Egypt, these variables are the Social influences and will be expressed and presented by the subjective norms, it could be expressed by a person's intention to behave in a certain way as it is contingent upon the attitude toward performing the behavior in question and the social pressure on him/her to behave in that way. This suggests that attitudes and subjective norms differ according to the person involved and behavioral context. The second variable is the lifestyle and will be expressed by Actions-Interests-Opinions and these are the main factors that this research is discussing in details. The exact meaning of these and other similar terms is never actually expressed but there seems a common understanding that will be reflecting on a pattern of attitudes and behaviors that are in some way consistent across an individual's life, or a particular domain of their life (Blackwell and Talarzyk, 1977) and the third variable is the ease of use which is focusing on the technology acceptance model (TAM) which is defined as the perceived usefulness by which the degree that the user believes that using the information system can improve work performance (Becker *et al.*,1995).

RESEARCH PROBLEM AND ITS IMPORTANCE

There are now more mobile phone subscribers in the world (1.4 billion) than there are wired phone subscribers. Worldwide, more than 350 billion text messages (or SMS) are exchanged across the world's mobile networks every month, with more than 15 % of these being classified as commercial or marketing messages (MA Glebal, 2013), despite the growing importance of mobile media in a global context. No known study has tried empirically to explain key success factors in mobile marketing with a cross-cultural approach. The Egyptian mobile market witnessed slow down in subscribers growth during the fourth quarter of 2009, particularly due to the severe competition that emerged in third quarter of 2009, inflating

subscribers growth during that quarter and, therefore, leading to weaker growth in forth quarter of 2009, “said by Belton in a note. Egyptians social influences, lifestyles and the new trend towards mobile usage with the increasing popularity of the internet and email marketing has become a convenient and dynamic mode of communication that enables business organizations and personal sellers to promote their products or services at a much lower cost and with a potentially more global reach therefore there are many reasons that drives this research and its importance’s stands from two point of views, the academic perspective and practical perspective that will be discussed further in details reaching to this main research problem What is the role of the social influences, lifestyles, ease of use in adopting SMS advertising in Egypt?

RESEARCH OBJECTIVES

The main aim of the study is measuring the role of Social influences, lifestyle and ease of use in adopting SMS advertising in Egypt. More specifically, the research study aims to achieve the following objectives:

Identify and measure the extent to which the use of new media influences the overall interactional or social strategy of credibility enhancement and persuasion in the context of sales promotion sent by SMS.

Explore and measure the impact of lifestyle components (activities, Interest and opinion) on the SMS advertising.

Explore and measure the impact of Social Influences components (subjective norms) on the SMS advertising.

Discover personal lifestyle characteristics of Egyptian consumers

Explore and measure the impact of rational components (perceived ease of use) on the SMS advertising.

LITERATURE REVIEW

This chapter is discussing an overview on different techniques for marketing being used recently, from these techniques are direct response marketing, it will be discussed in details and its differences from the direct marketing, secondly the concept of direct response advertising. This part of the study will show the previous experiences in different researches and lots of researcher’s point of views, reaching to the topic of mobile phone technology and its relationship with the SMS advertising. Finally this chapter will explain the external and internal factors that are playing an important role in adoption of SMS advertising in Egypt.

Direct Response Marketing: Direct-response marketing is a form of marketing designed to seek out a direct response, which is specific and quantifiable. The delivery of the response is direct between the viewer and the advertiser, by which the customer responds to the marketer directly. This is in contrast to direct marketing in which the marketer contacts the potential customer directly. There are differences between direct marketing and direct response marketing. In direct marketing (such as telemarketing) there is no intermediary broadcast media involved and do not allow for instant feedback, while in direct-response marketing, marketers use broadcast media to get customers to contact them directly (Wan, 2003).

Direct Response Advertising: Graham, (2001) studied the future of wireless advertisings, found that 60% of respondents showed interest in receiving text advertising through mobile phones and reported that brand awareness for the advertised brand increased more than 80% among respondents who received on average six SMS advertising Black (2001). Barwise and Strong (2002) studied SMS as a potential advertising means for young people, and found that 51% were very satisfied with a service that was customized and tailored to only receive messages relevant to interests.

Mobile Phones and SMS Advertising: Mobile phone technology is considered one of the greatest technologies to come into sight in the last few years to serve humanity, but it should not be used to annoy or tease others, mobile phones should never be used to go against others privacy. There is always going to be anti-social behavior, with or without mobiles (McMillan, 2002).

Factors influencing the adoption of SMS: This part is conversing different factors that influence the adoption of SMS advertising in Egypt; these factors are divided into external factors (subjective norms), and internal Factors (lifestyle and ease of use).

METHODOLOGY AND RESEARCH DESIGN

The aim of this chapter is to explain the reason behind using two different models for the data collection in order to reach to the most accurate results and the research design illustrates the sequential mixed model which is used in this study where semi structured in depth interviews will be conducted with Egyptian consumers to explore the components of lifestyle, social influences, ease of use and their effect on the adoption of SMS advertising in Egypt. The results of the in depth interviews will help developing the survey to measure this effect Therefore this study is sequential and mixed because the qualitative method will precede the quantitative study in order to determine the components which will develop the questionnaire. Previous studies such as the study of Wei (2006) indicated that the components of lifestyle cover four consumer segments. Therefore, the qualitative study explores these components to confirm their existence in a different cultural context and indicates whether or not other components should be included in the lifestyle of Egyptian consumers.

Research Design

Figure 1.3 Sequential Mixed Models

DATA ANALYSIS AND RESULTS

Qualitative Data Analysis

Qualitative data analysis is a method of inquiry employed in many different academic disciplines, traditionally in the social sciences, but also in market research and further contexts. Qualitative researchers aim to gather an in-depth understanding of human behavior and the reasons that govern such behavior. The qualitative method investigates the why and how of decision making, not just what, where, when but focused samples are more often needed, rather than large samples (Sproles, 1986). Qualitative research is often used for policy and program evaluation research since it can answer certain important questions more efficiently and effectively than quantitative approaches. This is particularly the case for understanding how and why certain outcomes were achieved (not just what was achieved) but also for answering important questions (Ram, 2006)

Semi-Structured In-Depth Interviews: Descriptive Analysis

The demographic profile of the 13 users of the mobile phone users consists of 5 males and 8 females; their age was between 20 and 30 years old and concerning their educational level, only 3 males have obtained Master's degree and the others have obtained Bachelor's degree

Demographics	Number of respondents
<i>Age</i>	
20-30	13
<i>Gender</i>	5
Female	8
<i>Educational Level</i>	10
Postgraduate	3

In-depth interviews Sample characteristics

Semi-Structured in-Depth Interviews: Detailed Analysis

The following themes were covered in the thirteen semi-structured in-depth interviews:

The Knowledge about the SMS Promotional Messages:

All interviewees were positively perceived the meaning of SMS promotional messages with previous background. They mentioned that they know about the SMS promotional message and they considered it as a useful advertising tool. Therefore, the theme is that SMS is a business opportunity for marketers to work on for reaching wide range of consumer for transferring any piece of information

Some supporting quotes: "SMS helps to keep any relation between the service provider and its client."

"SMS is the way to increase profitability since it is being used efficiently and effectively."

"SMS is very practical technique to reach your customers especially during the summer time"

Quantitative Data Analysis

Quantitative research refers to the systematic empirical investigation of social phenomena via statistical, mathematical or computational techniques. The objective of quantitative research is to develop and employ mathematical models, theories and/or hypotheses pertaining to phenomena. The process of measurement is central to quantitative research because it provides the fundamental connection between empirical observation and mathematical expression of quantitative relationships (Gilbert and Mulkay, 1984) After distributing 700 questionnaires, 397 were completed and returned by the respondents with response rate 56.7%. The questionnaires were distributed in Cairo and Alexandria. Finally the results were entered to the SPSS to analyze the results and to know whether the research hypotheses mentioned before were supported or not. The second part in this chapter after conducting the qualitative analysis with its detailed analysis and the themed analysis, is divided in two parts the first is the quantitative descriptive analysis of the sample regarding the socio-demographics sample structure to know the males/females ratios, age groups, marital status, monthly house hold income and the educational level. Then the second part, which is the variable dimensions, the reliability and the validity of each variable, statistical analysis, correlation and regression test are done in order to test the hypothesis by knowing the relation between the research model variables and to know the role of the independent variables and their effect on the dependent variables.

Descriptive Statistics: In this part, descriptive statistics are used to describe the features of the data gathered and to present the quantitative results in a manageable way in order to facilitate the understanding of the sample structure.

Sample Characteristics: The sample is described according to the socio-demographics dimensions listed in the questionnaires distributed on the respondents in order to segment the sample according to some valid

essential dimensions that the understanding of the sample structure according to age, gender, education, income level, occupation and marital status

Reliability and Validity of Scales

Reliability Statistics

Reliability of the scale means the extent to which the used scale produces consistent results if repeated measurements are made on the characteristics (Malhotra, 2007). The reliability of the proposed variables was tested to see to what extent the results in this survey could be relied on.

Discussion and Recommendations

This chapter is comparing the results of this study with the findings of previous studies, then the second part which is the conclusion of the findings of the study, followed by part three which is the implications of the research study where further analysis of the results is conducted.

Comparison with Findings of Previous Studies

As mentioned before the main reason of this study is to figure out the role of the social influences, lifestyles and ease of use on the adoption of SMS advertising in Egypt, and based on the previous studies and from the literature review discussed in chapter one, there were lots of hypothesis being reviewed and after conducting the in-depth interviews and the quantitative questionnaire these hypothesis were positively matching and significant with the findings from these hypothesis that were discussed previously the results showed the following: Graham (2001) studied the future of wireless advertisements, found that 60% of respondents showed interest in receiving text advertising through mobile phones and after conducting the results the statistics reviewed that 82% of the respondents found that they are satisfied from the SMS service and they find it important.

Another Study that was hypothesized, relationships were tested and supported by this research, Enpocket (2002) reported that 94% of respondents had read the SMS advertising messages, and 23% of them forwarded the marketing messages to friends, in this research and according to the findings shown on Table 2.2 (Reading the received SMS) and Table 4.4 (Forwarding SMS to a friend) 74% had forwarded the Received promotional SMS to family or friends, Table 4.13 (Forwarding SMS to Family/friends based on their needs) 86.2 % forwarded the promotional SMS to family or friends based on their needs.

56% of the respondents on this research paper that filled the questionnaire agreed to receive this type of messages and not only that, they reacted and they took an action by purchasing the product being promoted through the SMS being received and the figure related to (Buy things online) makes the picture more clearer by which it states that 55.9% of the respondents stated that they purchase things through the Internet and the figure related to (purchasing process based on received trusted SMS) and its explanation is that When the respondents were asked if they would purchase products or services based on received trusted SMS 37% were there response was strongly agree and 38.3% were agreeing

CONCLUSION

This study aimed to examine the role of the social influences, lifestyle and ease of use in adopting sms advertising in specifically Egypt. It was suggested that the social influences and the ease of use will be having the most impact on the adoption of SMS advertising while the results revealed that the three independent variables (social influences- ease of use and lifestyle) had a positive significant result on the dependent variable (adoption).

The demographics that was conducted and measured showed that the age group was mainly between 16 and 37 years old and this shows that this target age are the most adopting age for the SMS advertising in Egypt and they presented 80% of the sample. The majority of this sample was of income level from 3000-5000 EGP and finally marital statuses were married and well educated level since the outcome was extremely high positive strong significant results.

Implications of the Research Study

It is important to be certain that the SMS advertising is important tool of advertising for both parties either the sender or the receiver. A great opportunities for the sender of the SMS since he is moving on the right track as long as the SMS being sent is to the point (short and precise), sent at the right time, sent after taking the receivers permission, sent to suitable age group and identifying the senders name or brand name to be known to the receiver.

Academic and Practical Contribution

The Academic contribution: There are three strategies are recommended. First, mobile advertisers should employ professional copywriters to edit SMS advertising messages to make them easy to understand and fun to read. Second, mobile marketers can also make SMS advertising part of integrated marketing communications so that consumers would be familiar with the key brand message due to their exposure to other media. Finally, mobile operators and phone manufacturers should work together to make the process of responding to SMS advertising (e.g., providing feedback on products and services) as easy as possible.

Limitations and Directions for Future Research

There are limitations that should be considered with regard to this study. First, this study included limited number of consumer social influences, ease of use and lifestyle factors. In order to provide a broader view of social influences and lifestyle impacts on adoption of consumer technology products, future research could extend the findings by examining additional social influences, lifestyle and ease of use factors relevant to consumer technology products. To do so, future studies may use qualitative interviews with consumers by identifying various aspects of their social influences, lifestyles and ease of use more detailed that might be involved in consumption of consumer technology products. The price and word-of-mouth in this study is not. Price is a very important aspect when consumers engage in Adoption. Moreover, word-of-mouth might also exert influence in the adoption process. Therefore, price and word-of-mouth effects should be examined in future research.

THE RELATIONSHIP BETWEEN PROJECT MANAGEMENT AND SMALL TO MEDIUM ENTERPRISE PROFITABILITY

Julien Pollack, University of Technology Sydney

Daniel Adler, University of Technology Sydney

ABSTRACT

It is a common assumption that using project management is good for business. This research seeks to address this generally un-substantiated assumption by testing whether using project management as a core business skill has a positive influence on the profitability and sales of small to medium enterprises. Data used in this research is drawn from two surveys conducted by the Australian Bureau of Statistics covering the years 2004 – 2011. From this data models of the influence of project management were created using binary logistic regression and multiple linear regression, to examine whether the use of project management to undertake core business activities had a significant effect on small to medium enterprise profitability and total sales. When controlling for other comparable core business skills, the results show that project management does have a significant positive impact on profitability and sales. Similar results were also found for the use of IT professional skills, IT support technician skills and financial skills to undertake core business activities.

JEL: M110

KEYWORDS: Project Management, Small to Medium Enterprise, Profitability

INTRODUCTION

It is typically taken as assumed in the general business and specialist project management literature that the use project management to reach operational and strategic objectives actually improves the performance of organizations. This is usually taken as so obvious a fact that it is rarely questioned. If this assumption were not true, then there would little reason to support the significant expenditure often invested in developing and implementing project management systems, and gaining project management certification for employees. Many authors have commented to the effect that project management does positively affect organizational success, with the benefits of project management having been variously expressed in terms of performance (Abbasi & Al-Mharmah, 2000), effectiveness (Shenhar, Dvir, Levy, & Maltz, 2001), productivity (Cleland, 1984, McHugh & Hogan, 2011) and efficiency (Stimpson, 2008), all of which support a basic assumption that using project management is good for business. However, it remains largely unexamined whether this assumption is actually true, with the debate in the literature instead focusing on what is the best type of project management, how to implement it, and why projects are failing. There is very little research which has directly questioned whether there is a relationship between the use of project management and improved business performance. Exceptions include research by Lappe and Sprang (2014) and Thomas and Mullaly (2008). Hällgren (2012) has made a call for more research that questions the basic assumptions underpinning project management practice and research. This research responds to this call, by examining whether using project management as a core business skill does indeed have an effect on an organization's profitability.

LITERATURE REVIEW

A wealth of research has been produced which enquires into how project management can be refined and developed to deliver organizational objectives more effectively (e.g., Kloppenborg, Tesch, & Manolis, 2014, Hagen & Park, 2013). For instance, Mir & Pinnington (2014) have demonstrated that there is a link between project success and the maturity of project management processes, while a variety of authors have found links between project success and personality types (Cohen, Ornoy, & Keren, 2013, Creasy & Anantatmula, 2013). Others have focused on criteria that can be shown to affect project productivity (Ng et al, 2004), and the relationship between project success and portfolio management system maturity (Reyck et al., 2005). However, these findings are predominantly focused on the project level, leaving the relationship between project success and organizational success to implication only.

Studies that relate project management to business success are less common as a whole. Ozcelik (2010) provides one of the few examples that can be found in the literature, reporting on the ways in which one particular type of project impacted the overall organizational performance. Thomas and Mullaly (2008) have also enquired into whether businesses receive a return on investment from the implementation of project management practices. Their study involved 65 different organizations, and demonstrated that over one half of the studied organizations did derive measurable value from using project management. However, the findings of this study were limited, as few of their participating businesses collected the required data on investment in project management processes.

Another comparable study was completed by Lappe and Sprang (2014), who investigated 251 projects managed in a life insurance company in Germany. This study developed a model of investment in project management and return from that investment, and was able to demonstrate a reliable relationship between the costs and benefits of project management. In addition to a lack of research which questions the link between project management and business performance, there is a strong trend in project management research to focus on mega-projects (e.g., Flyvbjerg, 2014, Brady & Davies, 2014, Eweje, Turner, & Müller, 2012, Chang, Chih, Chew, & Pisarski, 2013, Winch, 2013). Contrary to this position, this research focuses on the impact of project management on small to medium enterprises. It is understandable why more research is focused on larger projects; the dollar figures associated with these projects provide an air of glamour, and their impressive failures and successes make for engaging stories. However, small to medium enterprises account for 70-90% of all enterprises in OECD countries, and are responsible for 40-70% of the value that is added by the business sector (OECD, 2013a, 2013b). The significance of small to medium enterprises to the economic and social health of countries around the world has long been the subject of research (Beck, Demirgüç-Kunt, & Levine, 2005, Ayyagari, Beck, & Demirgüç-Kunt, 2007, Schiffer & Weder, 2001).

In Australia, the subject of this research, over one million small to medium enterprises were in operation in 2012. This was over 90% of the business sector, with the profitability of small to medium enterprises clearly being critical to the economy (Australian Bureau of Statistics, 2012a, 2012c). A recent survey by the Australian Bureau of Statistics (ABS) found that project management was valued as a core skill by one in eight small to medium enterprises, with this number rising to one in five for innovation active businesses (ABS, 2013a). In the context of the broader management literature, enquiry into project management has often become submerged in broader management research into information technology, sales, marketing, and human resource management (Turner et al, 2009, Turner et al, 2010, Hudson et al, 2001). However, given the importance of small to medium enterprises to the economy, that project management plays a critical role in the survival and success of smaller businesses (Sádaba et al, 2014), and is a vital skill for small to medium enterprises (Turner et al., 2012), there is surprisingly little research into how project management is used by small to medium enterprises or how it affects their performance.

METHODOLOGY

The source of research data used in this study was the Business Longitudinal Database (BLD), produced by the Australian Bureau of Statistics. The BLD includes questions that focus on issues and criteria that may have an influence on the performance of Australian businesses, and was thus considered relevant to this study. Starting in the Australian financial year of 2004-05, the ABS has selected a panel of small to medium businesses. Members of the panels are asked to respond to five consecutive years of surveys, with the panel membership set in the first year of each panel. The size of each panel is calculated based on the expected rate at which members will drop out, ensuring that a sufficiently large number of panel members remain from each size classification and industry sector at the end of the five years. Two panels are of interest to this paper, as they both involved questions which asked about respondents' use of project management as a core skill in conducting their business (ABS, 2012b, 2012c). The survey of businesses from the 2004-05 financial year to 2009-10 (panel 1), and the survey of businesses from the 2006-07 financial year to 2010-11 (panel 2) are focused on in this research. There have been changes in the survey questions between panels, so it is not possible to combine the panel results into one population, or to directly compare between them, although there has been a similar focus in survey questions.

Only businesses with less than 200 employees are included in the BLD. Other exclusion criteria also apply. For instance, the BLD also only includes businesses with a single Australian Business Number and a simple structure (ABS, 2013b). The Oslo Manual guidelines for surveys that measure business innovation have also been incorporated in the survey development (OECD/Eurostat, 2005). The ABS BLD has also been integrated with some Australian Tax Office data. Based on the ABD BLD constraints, this research has worked with the definition of a small to medium enterprise as being a trading business with less than 200 staff. Other authors have also used the ABS BLD data in research (ABS, 2014), researching topics such as outsourcing (Bakhtiari, 2013), entrepreneurship (Fitzsimmons & Douglas, 2006), innovation (Huang & Rice, 2009, Bhattacharya & Bloch, 2004, Gronum, Verreynne, & Kastle, 2012), productivity (Pollack & Adler, 2014), performance (Steffens, Davidsson, & Fitzsimmons, 2009), family business operations (Dharmadasa, 2009), and industrial relations (Farmakis-Gamboni & Prentice, 2001).

DATA ANALYSIS

Analysis of the datasets has focused on three questions, paraphrased below to account for variation in how the questions were presented in the two surveys:

Compared with the previous year, did profitability decrease, stay the same, or increase?

During the previous year, were any of the following types of skills used by the business in undertaking its core activities: engineering (ENG); scientific and research (SCI); IT professionals (ITP); IT support technicians (ITS); trades (TRA); transport; plant and machinery operation (MAC); marketing (MAR); project management (PM); business management (BUS); financial (FIN).

Total sales, as reported in Australian Tax Office Business Activity Statements.

Is Project Management Related to Profitability?

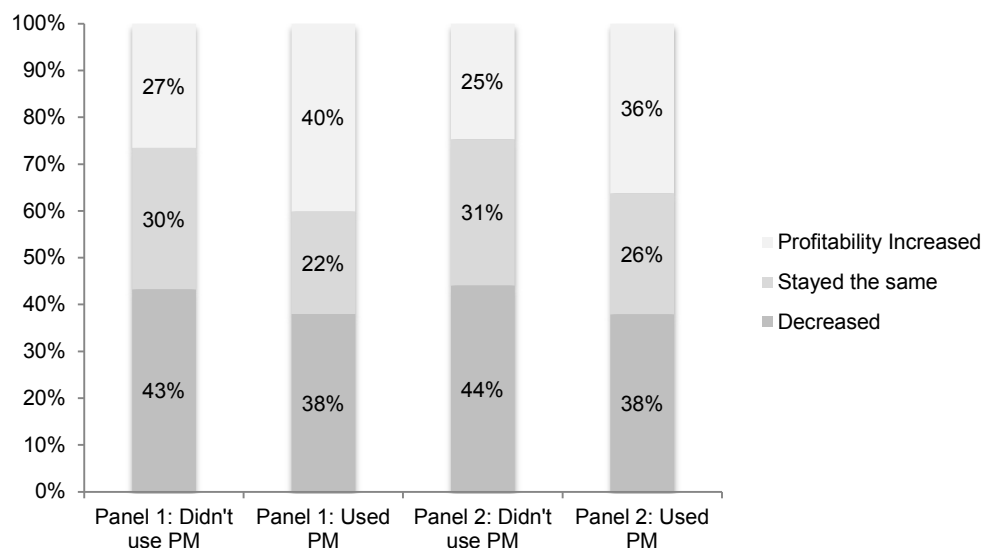

The initial analysis involved investigation of possible correlations between whether the respondents used project management, changing profitability, and changes in their sales figures. There was a correlation ($p < 0.01$) between change in profitability and use of project management in both panels, and between their reported total sales and their use of project management. The relationship between use of project management, profitability and total sales becomes clearer when presented as Table 1 and Figure 1.

Table 1: Influence of project management (PM) on reported sales

Panel	Use of PM	n	Min.	Max.	Mean	Std. Dev.
Panel 1	Did use PM	539	\$0	\$1,323,740,295	\$13,494,409	\$73,434,206
	Didn't use PM	4091	\$0	\$396,232,144	\$4,113,277	\$14,033,412
Panel 2	Did use PM	621	\$0	\$238,372,289	\$10,380,296	\$27,296,608
	Didn't use PM	5540	\$0	\$241,030,222	\$3,109,694	\$10,045,252

In Table 1 it can be seen that small to medium enterprises that used project management reported on average more than three times the sales that were reported by enterprises that did not use project management. Figure 1 shows that in both panels there are more than 10% more people in the population who used project management who reported an increase in profitability, compared to those who did not use project management. In addition, there were at least 5% less people in the population who used project management who reported an decrease in profitability, compared to those who did not use project management.

Figure 1: Influence of Project Management (PM) on Change in Profitability

These results are promising, but are not by themselves sufficient in demonstrating that project management leads to an increase in sales and profitability. It was considered necessary to model the relationship between total sales, profitability and project management, while controlling for other comparable variables, in order to develop an understanding of whether project management does actually affect profitability and sales.

Modelling the Datasets

A model was created of the relationship between small to medium enterprise profitability and the use of a selection of business skills. Binary logistic regression was used to create the model, and insignificant independent variables were eliminated from the model using backwards elimination. The model describes the tendency of the survey respondents to nominate that their profitability has increased since last year, as opposed to their profitability staying the same. Hypotheses were created to understand the usefulness of the model, and to understand the contribution of project management to the tendency to identify an increase in profitability. Equivalent null hypotheses and alternative hypotheses were created for each of the other business skills, but are not displayed here for the sake of brevity:

Null hypothesis – model: None of the coefficients in the model is significantly different from zero

Alternative hypothesis – model: At least one of the coefficients in the model is significantly different from zero and the model is useful

Null hypothesis – PM: Project management skills have no significant effect on whether an organization reported an increase in profitability

Alternative hypothesis – PM: Project management skills have a significant effect on whether an organization reported an increase in profitability

The final model was:

$$\text{Logit}(\text{increase}) = (0.421 * \text{ITP}) + (0.222 * \text{ITS}) + (0.342 * \text{MAR}) + (0.313 * \text{PM}) + (0.310 * \text{FIN}) - 0.362 \quad (1)$$

The significance of the model was 0.000 using the Omnibus Tests of Model Coefficients. The final model accounts for 58.4% of the variation in the dependent variable. Using the Hosmer and Lemeshow Test, the model has a significance of 0.575 and a Chi-square score of 2.901, suggesting an acceptable goodness of fit. On this basis, the null hypothesis for the model can be rejected, the alternative hypothesis can be accepted. Null hypotheses regarding the significance of project management, IT professionals, IT support technicians, marketing, and financial skills were rejected for this model, and the alternative hypotheses accepted. These results are summarized in Table 2. Null hypotheses regarding the significance of scientific and research skills, trades, transport, plant and machinery skills, and business management skills were accepted for this model.

Table 2: the Significance of Core Skills to Small to Medium Enterprise Profitability

Skill	Sig.	Use of Skill Increases Odds Of Increase In Profitability, As Opposed to Profitability Staying the Same, by:	Use of Skill Changes the Probability of Increased Profitability, As Opposed to Profitability Staying the Same, by:
IT Professionals (ITP)	0.001	52.4%	60.4%
IT Support Technicians (ITS)	0.049	24.8%	55.5%
Marketing (MAR)	0.001	40.8%	58.5%
Project Management (PM)	0.016	36.7%	57.8%
Financial (FIN)	0.002	36.4%	57.7%

Models of the relationship between small to medium enterprise total sales and the use of a selection of business skills were also created for each panel. Multiple linear regression was used to create the model, and insignificant independent variables were eliminated from the model using backwards elimination. The models describe the relative influence of the business skills on the business' reported total sales.

The final model for Panel 1 was:

$$\text{Total sales} = 1564973.48 - (3369846.7 * \text{SCI}) + (4925023.22 * \text{ITP}) + (3261601.44 * \text{ITS}) + (5392653.40 * \text{PM}) + (1940673.62 * \text{BUS}) + (2505495.36 * \text{FIN}) \quad (2)$$

No issues with colinearity were detected between the variables in this model. The model explains 2.9% of the data ($R^2 = 0.029$). The model was significant at 0.000. Null hypotheses regarding the usefulness of the model, and the significance of scientific and research skills, IT professionals, IT support technicians, project management, business management, and financial skills were all rejected and their alternative hypotheses accepted. Null hypotheses regarding the significance of trades, marketing, and transport, plant and machinery operation skills were all accepted.

The final model for Panel 2 was:

$$\text{Total sales} = 1318112.44 - (3082042.8 * \text{SCI}) + (3731526.44 * \text{ITP}) + (2152968.39 * \text{ITS}) + (1295676.84 * \text{MAC}) + (4574069.42 * \text{PM}) + (1187796.93 * \text{BUS}) + (2153946.41 * \text{FIN})$$

(3)

No issues with colinearity were detected between the variables in this model. The model explains 7.1% of the data ($R^2 = 0.071$). The model was significant at 0.000. Null hypotheses regarding the usefulness of the model, and the significance of scientific and research skills, IT professionals, IT support technicians, project management, business management, financial, and transport, plant and machinery operation skills were all rejected and their alternative hypotheses accepted. Null hypotheses regarding the significance of trades, and marketing skills were both accepted.

DISCUSSION

The first of the models above shows that the use of project management increases the odds of respondents identifying that their profitability had increased, as opposed to staying the same, when compared to their profitability in the proceeding year. IT professionals, IT support technicians, marketing and financial skills were also found to increase these odds. By themselves, these results suggest that these skills are significant in increasing the profitability of small to medium enterprises, but the subjective nature of this question should also be recognized. Respondents' answers were dependent upon their ability to perceive a change in profitability, and so might be subject to some error. To provide further insight into the question of whether the use of project management in small businesses does actually contribute to an increase in profitability, this research has also considered the impact of business skills on respondents' total sales, as reported in their official tax documentation. This analysis was undertaken on the assumption that an increase in sales typically contributes to an increase in profitability, although it is acknowledge that increases in the cost of sales have not been accounted for.

In both panels, project management, IT professionals, IT support technicians, financial and business management skills were found to have a significant positive impact on total sales. Of these business skills, project management was found to have the largest influence on sales results in both panels. The data on the influence of transport, plant and machinery operation skills was inconclusive, only having a significant impact in one panel. Trades and marketing skills were also found to not have a significant impact on total sales in either panel, the latter of which is of note given the focus of that discipline. In both panels, scientific and research skills were shown to have negative influence on total sales. One explanation of this finding is that research and development are often seen as a high-risk activities, which may only provide a return on investment in a limited number of cases. Alternatively, the return on investment from research and development may be seen over a longer time scale than captured in this survey. The effective use of scientific and research skills may most effectively be addressed by larger organisations more able to support the overhead of specialist equipment, and survive the necessary costs of failure associated with exploration.

Limitations and Future Research

The purpose of this research has been to investigate whether there is a reliable relationship between the use of project management and the profitability of small to medium enterprises. The purpose of the research has not been to create predictive models that claim to account for all factors that would determine the dependent variable. This is an important distinction, and it is acknowledged that many variables that may affect the profitability of a small to medium enterprise have not been accounted for in this research. The skills that a small to medium enterprise uses in conducting its business will affect its profitability, but by no means exclusively determine it; and this research makes no comment on the influence of business skills relative to other relevant factors, such as the prevailing business climate, government policies, business maturity, competitive environment, or employee capability. As the intention of this research has been to

investigate whether there is a reliable relationship between the use of project management and profitability, and given the size of the datasets, the R^2 values for the models presented in this research should be considered adequate. The reader is referred to other research with comparable R^2 values (Fullerton & Wallace, 2007, Hu & Hibel, 2014, Monge-Rojas et al, 2002, Karabag & Berggren, 2014). In addition, research by Knofczynski & Mundfrom (2008) recommends sample sizes for multiple regression models that have been created to predict the behavior of the dependent variable. Maxwell (2000, p. 435) notes that "...sample size will almost certainly have to be much larger for obtaining a useful prediction equation than for testing the statistical significance of the multiple correlation coefficient". It is also noted that the samples used in this research are larger than Knofczynski & Mundfrom's (2008) research has considered. This suggests that the models presented in this research may have a predictive validity, but as this has not been the purpose of this research, caution is warranted before they are used in this capacity. The models presented in this research demonstrate a relationship between the dependent and independent variables, but future research should consider additional other variables if the intention is to refine a model to predict the dependent variables.

It is also noted that there are a variety of other limitations to this research, including a focus on businesses in Australia with less than 200 employees. Caution should be exercised when extending these findings to larger organisations, or to organisations in other countries. Responses to the first dependent variable were also themselves dependent upon the respondents' ability to perceive a change in their profitability, but this has been ameliorated through use of secondary models focusing on total sales. There is also likely to have been some variation in how respondents interpreted what it was to use these business skills as the survey did not include definitions, but given the size of the samples it is likely that there has been some convergence on a common understanding. Future research could explore criteria that influence the perception of a change in profitability, what small to medium enterprise owners mean when they say they use a particular business skill, and the ways in which these results may vary from those found in larger organisations.

CONCLUDING REMARKS

This research has examined whether using project management is good for business, using data from two large longitudinal databases. It was consistently found that at least 10% more of the people who used project management reported an increase in profitability, compared to people who did not report using project management. There were at least 5% less people in the surveyed population who used project management who reported a decrease in profitability, compared to those who did not use project management. In addition, the average reported total sales for small to medium enterprises that used project management was more than three times higher than the average for those that did not use project management. Binomial logistic regression was used to test the hypothesis that using project management to undertake core business outcomes has a significant impact on a small to medium enterprise's profitability. Use of project management was found to have a significant impact, changing the probability of a small to medium enterprise reporting an increase in profitability, as opposed to profitability staying the same by 57.8%, when controlling for other comparable business skills.

Multiple linear regression was used to test the hypothesis that using project management to undertake core business outcomes has a significant impact on a small to medium enterprise's total sales. In both panels using project management was found to have a significant positive impact on businesses' total sales, when controlling for other comparable business skills. IT professional skills, IT support technician skills and financial skills were also consistently found to have a positive effect on both perceived productivity and total sales, suggesting that with project management these skills, represent key factors that can significantly contribute to the financial performance of small to medium enterprises.

BIOGRAPHY

Dr. Julien Pollack's main areas of research have been ways of improving project management practice, and trends in the applied management literature. His action research Ph.D. on the ways of developing project management won national and international awards. He has had one book published on project management, *Tools for Complex Projects* with Kaye Remington, and is a frequent contributor to the *International Journal of Project Management* and the *Project Management Journal*. He can be reached at the University of Technology, Sydney by email or post PO, NS W, 2007, Australia.

Daniel's keen interest in project management has been sparked by first hand experience of the commercialization and projectification of the public sector in Australia, which continues to drive and direct Daniel's research agenda. Daniel's research specializes in examining project management from social theory perspectives including activity theory and social network analysis, along with empirical research into the impact that project management has on business performance and productivity. Daniel holds degrees in Project Management, Applied Science and Sport Management, along with 20 years of combined front line experience in service delivery, government, sub-contracting and education. He can be reached at the University of Technology, Sydney by email or post PO Box, NSW, 2007, Australia.

MORAL-LICENSING EFFECTS: VOLUNTEERING AND JUSTIFICATION OF CONSUMPTION

Hyo-jin Jeong, Kyungpook National University
Dong-Mo Koo, Kyungpook National University

ABSTRACT

This study aims to investigate whether a prior moral behavior has an effect on a subsequent self-indulgent behavior in a sequential choice context. Monin and Miller (2001) and Monin and Jordan (2009) demonstrated that men provided with an opportunity to establish their credentials as non-prejudiced people by disagreeing with blatantly sexist statements were subsequently more likely to be sexist than were male participants who first responded to a more ambiguous statement about women. Priming people as being nondiscriminatory can activate a relevant self-concept of a non-prejudiced individual, providing behavioral confirmation for that self-concept, and consequently leading them to express prejudiced attitudes in subsequent choices. Khan and Dhar (2006) showed that intending to engage in altruistic acts such as volunteering and donation is likely to activate and establish altruistic credentials and liberate people to choose options that are more self-indulgent in a subsequent choice task (choosing designer jeans instead of a vacuum cleaner). Self-licensing or moral licensing can also occur vicariously through the observation of close others' moral behaviors or the mere presence of goal-congruent options in a choice set. Kouchaki (2011) showed that people are more willing to express prejudiced attitudes when their group members' past moral behavior has established non-prejudiced credentials. Specifically, participants who were told that their group was more moral than similar other groups were more willing to describe a job as better suited for Whites (expressing biased opinion) than for African Americans. Wilcox et al. (2009), in a food choice scenario, showed that participants are more likely to make an indulgent food choice when a healthy item is included in a choice set of unhealthy items compared to when there is a choice set consisting of only unhealthy items. This effect is stronger for those who have higher levels of self-control.

INTRODUCTIONS

Moral-licensing is the engagement in an virtuous acts such as volunteering, donation to charity, and others is likely to activate and establish moral credentials and to liberate people to choose options that are more self-indulgent in a subsequent choice task, for example, choosing more of hedonic goods rather than choosing functional goods. Three experiments theoretically based in a passive goal guidance model demonstrate that the moral licensing effect is stronger in people with high self-control (Study 1), and heighten moral self-evaluation (Study 2) and reduced guilt (Study 3), attained by committing to a volunteering act, mediate the effect of licensing on ratings of a luxury item.

RESULTS

Study 1 is tested volunteering acts increase individual's moral self evaluation, intentions to purchase luxury item, and whether self-control moderation effect. To test our propositions, measures of self-control ($\alpha = .726$), moral self-evaluation ($\alpha = .803$), and intentions to purchase the luxury ($\alpha = .893$) and the value item ($\alpha = .983$) were averaged to form respective indices. A median split (5.125) for self-control was used to classify participants into high and low self-control groups. It is expected that while participants high in self-control in the licensing condition would show higher levels of moral self-evaluation and intention to purchase the luxury brand than those high in self-control in the same licensing condition and those in the control condition, they would show no differences in intention to purchase the value item. A MANOVA test for the main effects of licensing condition and self-control and their interaction was conducted with moral self-evaluation, intention to purchase the value brand, and intention to purchase the luxury brand as

dependent measures. Consistent with our propositions, there was no effect of moral licensing ($F = .367$, $p = .546$, $\eta^2 = .005$), self-control ($F = 1.317$, $p = .255$, $\eta^2 = .017$), or their interaction ($F = .838$, $p = .363$, $\eta^2 = .011$) on intention to purchase the value brand.

It was also shown that, with respect to intention to purchase the luxury brand, the main effect of licensing condition ($F = 380.12$, $p < .001$, $\eta^2 = .833$) and the interaction between licensing condition and self-control ($F = 5.854$, $p = .018$, $\eta^2 = .072$) were significant, whereas the main effect of self-control was not ($F = .012$, $p = .912$, $\eta^2 = .000$). Participants in the license condition ($M_{\text{volunteer}} = 5.858$) were more likely to purchase the luxury brand than were those in control condition ($M_{\text{no volunteer}} = 2.283$; $t = 18.965$, $p < .001$). In addition, while participants high in self-control in the license condition were more likely to purchase the luxury brand ($M_{\text{volunteer}} = 6.093$) than were those low in self-control in the same licensing condition ($M_{\text{no volunteer}} = 5.667$; one-tail t -test = 1.727, $p = .05$) and those in the other two control conditions ($M_{\text{volunteer}} = 2.050$ and $M_{\text{no volunteer}} = 2.517$, $t_s < .001$). Participants high in self-control in the control condition were less likely to purchase the luxury brand than were those low in self-control in the control condition ($M_{\text{no volunteer}} = 2.517$ vs. $M_{\text{volunteer}} = 2.050$, $t = 1.763$, $p = .05$). These results coincide with the counterintuitive finding of stronger self-indulgence among high self-control individuals in the license condition.

With respect to moral self-evaluation, while the main effect of licensing was significant ($F = 17.12$, $p < .001$, $\eta^2 = .184$), neither the main effect of self-control ($F = .283$, $p = .597$, $\eta^2 = .004$) nor their interaction ($F = .148$, $p = .702$, $\eta^2 = .002$) was significant, such that participants in the license condition ($M_{\text{volunteer}} = 5.456$) consider themselves more compassionate, sympathetic, warm, and helpful than those in the control condition ($M_{\text{no volunteer}} = 4.763$; $t = 4.144$, $p < .001$)

Moral self-evaluation as a mediator in Study 2 is tested using a more stringent method in comparison to prior studies, whereas reduced guilt, which had not yet been empirically tested, is established as a mediator in Study 3. People license themselves to indulge by perceiving progress on a long-term goal (e.g., helping others in need), which releases them to pursue other restrained goals. Implications and future research directions are discussed in conclusion.

To test our propositions, a MANCOVA and a bias-corrected (BC) bootstrapped mediated moderation analysis were used. In the MANCOVA model, the main effect of licensing condition taking into account the three median-split covariates (sale proneness, propensity for conspicuous consumption, and orientation toward volunteering) was evaluated in its effect on moral self-evaluation (moral self-evaluation after the manipulation minus that before the manipulation), intention to purchase the value brand, and intention to purchase the luxury brand. All three models were significant ($F = 9.402$, $p < .001$, $\eta^2 = .257$ for moral self-evaluation; $F = 2.384$, $p = .023$, $\eta^2 = .081$ for intention to purchase the value brand; and $F = 3.720$, $p = .001$, $\eta^2 = .121$ for intention to purchase the luxury brand) (A MANOVA excluding the three covariates showed that the three models remained significant, though the effect sizes were slightly reduced ($F = 14.755$, $p < .001$, $\eta^2 = .234$ for moral self-evaluation; $F = 2.920$, $p = .022$, $\eta^2 = .057$ for intention to purchase the value brand; and $F = 3.505$, $p = .009$, $\eta^2 = .068$ for intention to purchase the luxury brand). This implies that the licensing effect remains even when the effects of the three covariates are not considered.)

Among the three covariates, propensity for conspicuous consumption had a significant main effect on moral self-evaluation, and tendency to purchase the value brand had a significant main effect on intention to purchase the luxury brand. These results did not change the results associated with moral licensing and will not be further discussed. With respect to moral self-evaluation, consistent with the propositions, results (first panel of Figure 1) revealed a significant main effect of moral licensing ($F = 15.182$, $p < .001$, $\eta^2 = .242$). Moral self-evaluations in all licensing conditions were higher than were those in the control condition ($M_{\text{control}} = .005$ vs. $M_{12 \text{ h intent}} = .188$, $p = .015$; vs. $M_{24 \text{ h intent}} = .238$, $p = .001$; vs. $M_{36 \text{ h intent}} = .453$,

$p < .001$; against $M_{12\text{ h past}} = .500$, $p < .001$). While the ratings of moral self-evaluation between the 12-hour intent condition and 24-hour intent condition and between the 36-hour intent condition and the past 12-hour condition did not differ (p -values $> .376$), the ratings between the 12- and 36-hour intent licensing conditions ($M_{12\text{ h intent}} = .188$ vs. $M_{36\text{ h intent}} = .453$, $p = .001$), those between the 12-hour intent and 12-hour past conditions ($M_{12\text{ h intent}} = .188$ vs. $M_{12\text{ h past}} = .500$, $p < .001$), those between the 12-hour intent and 36-hour intent conditions ($M_{24\text{ h intent}} = .238$ vs. $M_{36\text{ h intent}} = .453$, $p = .007$), and those between the 24-hour intent and 12-hour past conditions ($M_{24\text{ h intent}} = .238$ vs. $M_{12\text{ h past}} = .500$, $p = .001$) were significant. The above results show that the more people intend to volunteer in the future, or if have already volunteered in the past, the more favorable were their moral self-evaluations as opposed to those who did not perform the act (control condition). These ratings were also compared before and after the manipulation. Indeed, before the manipulation, the respondents did not differ from each other in moral self-evaluation between conditions ($M_{\text{control}} = 3.590$; $M_{12\text{ h intent}} = 3.653$; $M_{24\text{ h intent}} = 3.628$; $M_{36\text{ h intent}} = 3.601$; $M_{12\text{ h past}} = 3.258$, $F = 2.317$, $p = .059$). However, after the manipulation, moral self-evaluations ($F = 10.897$; $p < .001$) increased significantly ($M_{\text{control}} = 3.600$; $M_{12\text{ h intent}} = 4.028$; $M_{24\text{ h intent}} = 4.105$; $M_{36\text{ h intent}} = 4.507$; $M_{12\text{ h past}} = 4.258$). The smallest increase from the control condition was found in the 12-hour volunteering condition (.428, an 11.88% increase from the control condition). This increased moral self-evaluation is attributable to volunteering engagement.

Figure 1: Effects of Moral Licensing on Moral Self-Evaluation and Intent to buy The Luxury and Value Brands

With respect to intention to purchase the value brand, results as shown in the second panel of Figure 3 revealed a significant main effect of moral licensing ($F = 3.536$, $p = .008$, $\eta^2 = .069$), such that when people intend to invest more than 36 hours volunteering or had invested 12 hours in the past, they were less likely to purchase the value brand ($M_{\text{control}} = 3.233$ vs. $M_{12\text{ h intent}} = 3.269$, $p = .582$; $M_{\text{control}} = 3.233$ vs. $M_{24\text{ h intent}} = 3.323$, $p = .898$; $M_{\text{control}} = 3.233$ vs. $M_{36\text{ h intent}} = 2.901$, $p = .058$; $M_{\text{control}} = 3.233$ vs. $M_{12\text{ h past}} = 2.760$, $p = .007$). The other four comparisons showed that the time people invested in volunteering, or if they had volunteered in the past, the less likely they are to purchase the value brand ($M_{12\text{ h intent}} = 3.269$ vs. $M_{36\text{ h intent}} = 2.901$, $p = .025$; $M_{12\text{ h intent}} = 3.269$ vs. $M_{12\text{ h past}} = 2.760$, $p = .003$; $M_{24\text{ h intent}} = 3.323$ vs. $M_{36\text{ h intent}} = 2.901$, $p = .050$; $M_{24\text{ h intent}} = 3.323$ vs. $M_{12\text{ h past}} = 2.760$, $p = .007$). This may be attributable to the fact that investing more time in moral behaviors may have reminded people of their frugality goals, leading to more frugal behavior (i.e., refraining from purchasing even the value products).

With respect to intention to purchase the luxury brand, results also revealed a significant main effect of moral licensing ($F = 4.610$, $p = .001$, $\eta^2 = .088$), as shown in the third panel of Figure 3. Respondents in the

12- ($M_{12\text{ h intent}} = 3.824$) and 24-hour ($M_{24\text{ h intent}} = 3.752$) intent conditions had similar levels of intention to purchase the luxury brand compared to participants in the control condition ($M_{\text{control}} = 3.680$, $p = .553$ and $p = .598$, respectively). Respondents in the 36-hour intent condition ($M_{36\text{ h intent}} = 4.162$) and 12-hour past condition ($M_{12\text{ h past}} = 4.135$; $p = .806$) did not differ, and had much higher levels of intention than did those in the other conditions, including the control condition ($M_{\text{control}} = 3.680$, $ps \leq .012$). The results reveal that (1) people need to invest at least 36 hours of volunteering work for future intentions, (2) whereas they only need to invest 12 hours if it is past behavior that licenses people to indulge in or to purchase luxury items. The effects created by these two conditions were similar ($M_{36\text{ h intent}} = 4.162$ vs. $M_{12\text{ h past}} = 4.135$, $p = .806$).

Next, the potential mediating effect of moral self-evaluation on the effect of moral licensing on intention to purchase luxury items is examined. As we explained, the mean rating of moral self-evaluation after the manipulation is subtracted from that before the manipulation to form an index, which was then analyzed. To test this mediation effect, a BC bootstrapping analysis was used (Hayes, 2012). We used the PROCESS macro for SPSS, applying Model 4 (Hayes, 2012), which enables the calculation of confidence intervals (CIs) for conditional indirect effects (5,000 resampling method).

The results produce two multiple regression models. In the first model, the main effect of moral licensing (contrast coded: control = -1; 12-hour intent = 1; 24-hour intent = 2; 36-hour intent = 3; 12-hour past volunteering = 4) after accounting for the three covariates (participants' orientation toward volunteering, deal proneness, and propensity for conspicuous consumption) on moral self-evaluation (mediator) was tested. In the second model, intention to purchase the luxury brand was regressed on the mediator, the independent variable, and the three covariates. The results are shown in Table 1. In Model 1, while the licensing condition and orientation toward volunteering (higher volunteerism leads to lower moral self-evaluations) were significant, propensity to purchase luxury products and deal proneness were not. The bootstrapping results for the licensing condition ($\beta_{\text{licensing}} = .210$, $t = 7.74$, $p < .001$) show that neither of the two coefficients included in the lower and upper boundary (95% BC CI = .156; .263) contain zero, indicating that the licensing manipulation is significant. These findings in Model 1 are consistent with those of the MANCOVA.

In Model 2, while the licensing condition ($\beta_{\text{moral licensing}} = .004$; $t = .118$, $p < .907$; 95% BC CI = -.060, .067) and the three covariates became non-significant, the mediator was significant ($\beta_{\text{moral self-evaluation}} = .445$; $t = 5.98$, $p < .000$; 95% BC CI = .298, .592). At the bottom of Table 1, the indirect effect of moral self-evaluation (mediator) and the associated Sobel test statistic (found in the 'Normal theory tests for indirect effect') are found. Both the indirect effect ($\text{indirect } \beta_{\text{moral self-evaluation}} = .093$; 95% BC CI = .061, .133) and the Sobel test were significant ($z = 4.71$, $p < .001$). As in Khan and Dhar's (2006) study, all these statistics confirm that moral self-evaluation fully mediates effect of licensing on intention to purchase luxury items.

Recent consumer choice research has focused on decisions that follow other decisions (Dhar & Simonson, 1999; Novemsky and Dhar, 2005) and multiple goal management (Laran & Janiszewski, 2009). This article examined how prior intent to perform a volunteering act licenses people to make subsequent indulgent decisions. This process is mediated by changes in both moral self-evaluation and reduced guilt in its effect of relative ratings on luxury and value brands. Our results demonstrated that the relative preference for a luxury brand over a value brand is higher if people intend to volunteer in the near or have done so in the past. This licensing effect occurs because this virtuous intent or past behavior boost moral self-evaluations and simultaneously reduce negative self-attributions (i.e., reduced guilt). It was also shown that the licensing effect is more pronounced for people high in self-control.

Table 1: Bias-Corrected Bootstrapped Mediated Moderation Analysis

Model 1: R² = .255; F = 16.52 (df₁ = 4, df₂ = 193, p < .001)						
<i>DV = Moral self-evaluation</i>	Std. Beta	SE	t	p	Lower CI	Upper CI

ABSTRACT

Each year, millions of American households find themselves overwhelmed with debt and struggling to maintain their monthly payments. While the literature on debt counseling seems to suggest that financial counseling can be effective in improving borrower's financial problems, only a small fraction of Americans use this type of advice. In this paper, we examine nationally representative data from the 2012 National Financial Capability Study to provide an overview of overindebtedness in the United States and identify factors that are associated with take-up of professional financial advice on debt. The data show that only 9% of Americans used debt counseling services in the five years prior to the survey, despite over 40% think they have too much debt. Moreover, we show that many Americans lack trust in financial professionals and perceive a disconnect between the type of financial advice offered and their personal financial situation. The research helps identify barriers that prevent consumers struggling with debt seeking professional financial advice.

KEYWORDS: Debt Counseling, Financial Advice, Debt, Overindebtedness, Financial Literacy

INTRODUCTION

Each year, millions of households find themselves overwhelmed with debt and struggling to maintain their monthly payments. According to recent economic data, Americans in 2014 owed more than \$11.6 trillion in debt, an increase of 3.4% on the previous year. The individual borrower owed on average \$15,593 in credit card debt, \$153,184 in mortgage debt and \$32,511 in student loan debt (<http://www.nerdwallet.com/blog/credit-card-data/average-credit-card-debt-household/>.) Research has shown that high levels of indebtedness are widespread in the US and debt characterizes most of the career of the average American. Millennials start their careers heavily indebted - especially college-educated Millennials, who frequently carry student loan debt (de Bassa Scheresberg, Lusardi, and Yakoboski, 2014). Middle-career individuals are heavily leveraged, especially on their homes (de Bassa Scheresberg and Lusardi, 2014). And a growing share of Americans is entering into retirement with debt (de Bassa Scheresberg and Lusardi, 2014b).

This widespread overindebtedness has substantial consequences for the economy and the functioning of the financial system as a whole. Overleveraged consumers have been behind the burst of the housing bubble in 2008 and the great recession that followed. Overindebtedness has also indirect negative implications for the economy; for example, it has been linked to stress and decrease in productivity at the workplace. Research conducted by employee benefits provider Sodexo Benefits and Rewards Services found that of 760 UK employees ranging from 18 to 64 year-olds, the age group worst affected by financial stress were those aged 18-34 (<http://www.forbes.com/sites/clarebettelley/2014/11/22/why-workplace-financial-education-should-be-part-of-every-employers-corporate-social-responsibility-agendas/>). Among this group, more than a third of employees claimed their productivity had been damaged due to money worries, and, across

the whole workforce, 32% admitted calling in sick due to stress, with 36% stating that financial pressure was the main reason.

Given the pressing problem of overindebtedness for the American population, it is important that individuals are capable to make good debt management decisions and receive professional financial advice to help them address their debt management challenges. In this paper, we examine nationally representative data from the 2012 National Financial Capability Study to provide an overview of overindebtedness in the United States and identify the factors that influence take-up of professional financial advice on debt. We show that only 9% of Americans used debt counseling services in the five years prior to the survey, despite over 40% think they have too much debt. Moreover, we show that many Americans lack trust in financial professionals and perceive a disconnect between the type of financial advice offered and their personal financial situation.

Data

This paper uses data from the National Financial Capability Study (NFCS) to examine the extent of long-term and short-term indebtedness in the United States and to identify the socio-demographic and financial factors that are associated with use of professional financial advice on debt. The first NFCS survey, supported by the FINRA Investor Education Foundation, was conducted in 2009 to assess and establish a baseline measure of financial capability among American adults. In 2012, the survey was updated to reassess key measures from 2009 and expanded to cover additional relevant topics such as student loans, mortgage debt, and medical debt. With a sample size of 25,509 observations, the overarching objectives of the NFCS are to benchmark key indicators of Americans' financial capability and evaluate how these indicators vary with underlying demographic, behavioral, attitudinal, and financial literacy characteristics. The NFCS survey is primarily focused on how people manage their resources, how they make financial decisions, and the skill sets they use in making those decisions. Due to the wealth of information on debt, debt-management, and use of financial advice, the NFCS survey is optimally suited for an analysis of the issue under consideration.

An Overview on Debt and Overindebtedness

To gain insight into the overindebtedness of respondents, we examine responses to a number of questions that specifically ask about long-term liabilities, such as mortgages, auto loans, student loans, and home equity loans, and short-term liabilities, such as credit-card debt, medical debt, and use of Alternative Financial Services. The analysis shows that Americans have significant holdings of all forms of long-term liabilities. Among all respondents in the sample, 35 percent have a mortgage, 31 percent of respondents have auto loans, 20 percent have student loans, and 10 percent have home equity loans. Combining the different measures of long-term debt into a single indicator provides a better understanding of overall indebtedness. Accordingly, 60 percent of respondents have at least one of the above four sources of long-term debt, and 26 percent have at least two (see Figure 1). Sources of debt vary considerably when age breakdowns are examined. For example, the youngest age bracket is much more likely to have student loan debt (36 percent) than the oldest group (6 percent).

The oldest group, meanwhile, is much more likely to have home equity loans (14 percent) than the youngest (6 percent). Moreover, the middle-aged are more likely than younger and older individuals to have a mortgage debt. In other words, even if the components of debt change with age, long-term debt follows most Americans throughout the different stages of their life. Given that most respondents deal (directly or indirectly) with multiple sources of long-term debt, we examine to what extent this debt generates financial distress. The NFCS survey includes a set of questions designed to measure financial distress, including concerns about student loan, mortgage, and medical bill repayment. The analysis shows that most respondents are concerned about their ability to repay long-term debt (see Figure 2). Twenty-two percent of respondents indicated that they are underwater on their mortgages – meaning they currently owe more

than they think they could get by selling their homes. Furthermore, when asked if they had been late on a mortgage payment in the last two years, 8 percent responded that they had been at least once and 13 percent said it happened at least twice. More than half of respondents with student loans (54 percent) are concerned about paying them off. Finally, more than a quarter of respondents report having unpaid medical bills, a troubling finding because it shows that many Americans lack funds to weather unexpected shocks.

Short-term liabilities represent another important source of debt. To ascertain to what extent respondents make use of short-term credit, we analyze measures related to credit card behavior, use of alternative financial services (AFS), and other means of short-term borrowing, such as borrowing from retirement accounts and overdrawing from checking accounts. These behaviors are associated with fees and other costs that can affect respondents' financial positions. Credit cards are a very common source of short-term debt. Seventy-three percent of Americans report having one or more credit cards; among these cardholders, less than 50% percent report always paying their credit card bill in full. Most importantly, many respondents display "expensive" credit card behaviors, using credit cards in ways that are likely to generate fees and other costs. Thirty-four percent made only the minimum payments against their credit card bills over the same period, and that number rises to 44% for respondents aged 18 to 34. Furthermore, 16 percent of credit cardholders were charged a fee for late payments, 8% percent were charged an over-the-limit fee in some months, and 11% percent used the card for a cash advance. When assessed collectively, 41 percent of cardholders engaged in some form of expensive credit card behavior in the 12 months prior to the survey. It is important to note that younger respondents have, on average, significantly more trouble managing their credit cards. More than half (52 percent) engage in expensive behaviors compared with 35 percent of cardholders aged 51 to 65. Younger respondents thus seem to be the subgroup experiencing the greatest financial challenges. They may benefit from financial advice and other financial services specifically designed for their needs.

Many respondents also use AFS. Nearly 30 percent (29 percent) of respondents report using at least one type of AFS (pawnshop, payday loan, auto title loan, advance on a tax refund, or rent-to-own store) in the five years prior to the survey. Again, young respondents are more likely to use these high-cost methods of borrowing than other age groups (44 percent). Given that most respondents deal with multiple debt sources, it is important to assess to what extent they feel burdened by these obligations. The NFCS includes two questions that measure respondents' perceived level of over-indebtedness and satisfaction with their current personal financial condition. The first question asks how strongly the respondents agree, on a scale of 1 to 7, with the following statement: "I have too much debt right now." When asked this question, 42 percent of respondents agreed that they have too much debt, that is, a score of 5 to 7, 7 designating a response of "Strongly Agree." (See figure 3). Young respondents are more likely to feel over-indebted compared with older age groups (46 percent versus 33 percent for respondents older than 50).

Use of Debt Counseling and other Financial Advice

Given that over 40 percent of Americans think they have too much debt, it is important to understand whether they have the personal financial literacy skills to make good debt management decisions and whether they have access to professional financial advice that can help them with such debt management challenges. The NFCS asked respondents about their use of professional advice in the five years prior to the survey on such topics as mortgages, saving and investments, and debt counseling. We investigate these questions to understand how much these services are actually used by the population. The data reveals that an alarming 59 percent of the American population has not sought financial advice of any kind in the five years prior to the survey. Moreover, respondents are most likely to seek advice on saving and investments or mortgages than on debt (see Figure 4). This is especially worrisome: even though many of the respondents in the sample report feeling overburdened with debt obligations, only few have sought debt counseling. In fact, even among those who agree with the statement "I have too much debt right now," 86 percent have not sought financial advice of any kind. Indeed, debt counseling remains the least popular

source of professional advice. Lastly, it is interesting to note that financial literacy is positively correlated with the use of financial advice, but not with debt counseling. Among those who were able to correctly answer three questions designed to measure respondents' degree of financial knowledge, 52 percent report using financial advice. Conversely, among those who could not correctly answer the three financial literacy questions, 35 percent use financial advice (This is in line with other research on the topic showing that financial literacy is complementary to financial education, not a substitute for it (Collins 2012).) The relationship, however, goes in the opposite direction for debt counseling. Respondents who answered the three financial literacy questions correctly are less likely to use debt counseling than those who did not answer the three questions correctly (7 percent vs. 10 percent). Finally, we analyze three questions from the 2009 wave of the NFCS to assess how much respondents trust financial professionals, whether they think that financial advice is too costly for them, and whether they think they are able or unable to find customized counseling. More specifically, the 2009 NFCS asks respondents:

How strongly do you agree or disagree with the following statements? Please give your answer on a scale of 1 to 7, where 1 = "Strongly Disagree," 7 = "Strongly Agree," and 4 = "Neither Agree Nor Disagree," you can use any number from 1 to 7.

"I would trust financial professionals and accept what they recommend."

"Financial professionals are too expensive for me."

"It is hard to find the right financial professional for me."

Only 32 percent of respondents indicated that they would trust financial professionals and accept their recommendations. Also, those with higher financial literacy levels tend to trust financial professionals more than those who are less financially literate. This signals a potentially vicious cycle in which the less financially literate do not seek the advice they need. Perceived cost and difficulty finding a good match are additional barriers to use of financial advice. Forty percent of respondents think financial professionals are too expensive for them, and 30 percent think that it is hard to find the right financial professional for their personal situation.

Who Is More Likely to Ask for Professional help on Their Debt?

Multivariate analysis can provide a clearer understanding of the relative influence of socio-demographic and financial factors on use of debt counseling services. We run multiple linear probability models where the dependent variable is a dummy variable equal to one if the respondent has sought advice on debt within the five years prior to the survey and equal to zero otherwise. All socio-demographic factors are then analyzed with respect to their impact on the likelihood of having received such advice. The sample for the empirical analysis is composed of 24,692 observations. Table 1 reports the coefficient estimates. To gain a comprehensive understanding of how socio-demographic factors affect financial outcomes, multiple specifications are used. We also run the different specifications both on the full sample and on a sample composed only of respondents who reported to have too much debt (10,415 observations).

Regression results show that a few demographic groups are more likely to use debt counseling services. In particular, young respondents, respondents who are widowed or have kids, and respondents who have high financial risk tolerance are more likely to make use of this type of advice. Moreover, African-Americans are 4 to 5 percentage points more likely to seek debt counseling than White respondents. Use of debt counseling is also positively associated with income, which may be due to the fact that those who have higher income have higher possibility to borrow, but also, they have more possibility to pay for such advice. Having experienced an income shock is another important factor; respondents who experienced a large drop of income in the 12 months prior to the survey are 7 to 8 percentage points more likely to seek advice on debt. On the other hand, financial literacy is negatively correlated with use of debt counseling, which may be explained by the fact that more financially literate individuals are less likely to have debt management problems. However, even among those who feel they have too much debt, more financially literate individuals are less likely to ask for advice on their debt. Finally, we look at how the different sources of long-term debt impact the probability of seeking debt counseling services. We find that having student loan

debt and having home equity lines increases the likelihood of using debt counseling by 6 to 7 percentage points.

CONCLUSION

We examined representative data from the 2012 National Financial Capability Study to provide an overview of overindebtedness in the United States and identify factors that are associated with take-up of professional financial advice on debt. The data show that Americans have significant holdings of long-term and short-term liabilities which translate in widespread indebtedness. Accordingly, we find that over 40% of the American population think they have too much debt. But despite most American households have to deal with debt and debt management, only a very small share of the population reported to seek for debt counseling. Data from the NFCS shows that only 9% of Americans used debt counseling services in the five years prior to the survey. Data further shows that many Americans lack trust in financial professionals and perceive a disconnect between the type of financial advice offered and their personal financial situation. Finally, we run a set of multivariate regressions to identify factors associated with take up of such advice. The analysis shows that debt counseling services, as they are offered at the moment, do not seem to appeal to consumers despite the vast need among the population for help on debt management decisions.

EXPLORING THE EXISTENCE OF OPTIMAL CAPITAL STRUCTURE AND ITS EFFECTS ON TAX ARBITRAGE AND SHAREHOLDER WEALTH CREATION IN THE PHILIPPINE REAL ESTATE INDUSTRY

Jan Rizza D. Ang, De La Salle University - Manila

Jia Andrei R. Telmo, De La Salle University - Manila

ABSTRACT

In this study, the researchers used Panel Data Regression on 35 firms to explore the existence of optimal capital structure. This is done with reference to firm-specific characteristics (size, profitability, growth opportunity, debt tax shield, non-debt tax shield, and firm ownership structure) as determinants on a five-year span from 2009 to 2013. In addition, this research examines the possibilities surrounding the adaption of optimal capital structure in terms of increasing shareholder value. Path Analysis is used in order to strengthen the empirical evidence for arguments on causality. Thus, this research is both an exploratory and explanatory in design. Findings of this study have proven that these six variables have causal effects on the optimal capital structure of the firm. Also, optimal capital structure maximizes share price and the order of sensitivity of the predictors in influencing share price appear in a descending order of growth opportunity, size, profitability, family firm, non-debt tax shield, and debt tax shield, with only debt tax shield found to discourage debt financing.

INTRODUCTION

The growing trend in real estate is very much evident across the Asia Pacific Region. Despite the earthquake-prone geographic location on the Pacific Ring of Fire, traffic and congestion issues and its annual share of at least 20 storms, the Philippine real estate industry is continually being patronized by foreign investors because of the great land areas that come at affordable prices (Santos, 2013). Factors such as the increasing Philippine population, covering locals, tourists and international migrants also contribute to fueling the country's real estate industry as they demand for housing where they can temporarily or permanently settle. The city, commended for its young demographic, strong remittances inflows from overseas Filipino workers and a Western-inspired workforce, is also a favorite for both residential and office markets as supported by foreign direct investments. Presently placing fourth in investment prospects and eighth for development prospects, Manila is becoming a growing interest in the eyes of investors, according to survey results conducted by the international capital group of Jones Land LaSalle in 2014 (Reyes, 2014).

Although the real estate's trend is booming, there is still no guarantee to perpetual victory. Many property developers have been eliminated from the industry for reasons such as incompetent financial analysis and risk assessment, inadequate project briefs, poor sales and marketing plan and failure to consider operational issues at project inception. Failure to understand the market and engaging with their customers is another, which leaves the developer with complete infrastructures with few buyers. Disbursement of too much money for a given land component may prove unfavorable as well. Ideally, land components should not

exceed 14% to 16% of the overall development budget to provide developers with a reasonable return on investments. Moreover, exposure to market changes and real estate cycles brought about by project size and scales and variations and design changes subsequent to contract execution and inadequate project contingencies, as well as lack of focus and engagement are all potential issues that might lead to developers' downfalls too (CCG, 2012).

As a response to the continual fluctuations in market conditions, schemes devised to remain competitive are persistently changing as well. Correspondingly, results for the 2013 Nyenrode Survey conducted amongst ING Real Estate Finance's clients in the European listed and institutional real estate sector showcases benefits of diversifying entities' funding sources (ING Bank N.V., 2014). By gaining an understanding of an entity's entire capital stack, the most attractive fusion of debt and equity financing may be developed to maximize expected outcomes (Cushman & Wakefield, 2014). Given this, the following research questions were formulated: (1) How do firm-specific factors - company firm size, profitability, growth opportunity, debt tax shields, non-debt tax shields and firm ownership - affect the capital structure decision of entities?; (2) How do each capital structure factor relate to the shareholder wealth creation?, and (3) What is the order of sensitivity of these factors?

LITERATURE REVIEW

Given the growth that is seen to progress in the coming years, competition has also been observed to be strict. In order to gain a market niche, developers ought to promote the perception of ability, possess their own core abilities, find ways to efficiently match buyers and sellers, and to forge the right communal relationships to demonstrate their capabilities in effectively and efficiently handling complex, dimensional and multi-party interactions (Brown, 2012). All market players employ distinct strategies to set them apart from their competitors. Congruently, while new entrants in the market are competing to take a ride on the booming real estate trend, old players such as property giants today: Ayala Land Inc., SM Prime, Megaworld, DMCI Homes, Federal Land, Robinsons Land Corp., Vista Land and Lifescapes, Filinvest Land, Shang Properties, Century Properties, Empire East and Rockwell Land, are incessantly modifying their strategies to strengthen foothold (Ambas, 2014).

Capital structure planning is one of the most important aspects in managing the finances of a firm. Its prominence in the life of the business propelled scholars and researchers to conduct studies on the factors that may exhibit statistically significant relationship with capital structure. Ali (2011) examines the capital structure of nonfinancial firms to determine which variables impact the capital structure of Pakistani firms. His findings present negative relationships between profitability and leverage while growth and dividend directly affects total debt which confirms the presence of pecking order theory in explaining the financing behavior of Pakistani firms. Ali (2011), Antoniou, Guney, and Paudyal (2002), Frank and Goyal (2009) examined the determinants of capital structure through panel data analysis. The predominantly used firm-specific variables are firm size, profitability, growth opportunities and debt tax shields. Antoniou, Guney, and Paudyal (2002) investigated the determinants of leverage ratio presented as a function of firm specific characteristics and market related factors for companies in France, Germany and Great Britain through panel data analysis. They conclude that leverage ratios are adjusted to meet the targeted capital structure. The findings from the past studies are inconsistent as not all variables exhibit significant relationship with capital structure. Varying results are caused by a handful of theories associated with capital structure.

Apart from optimizing the firm's capital structure, one of the primary goals of managers is to maximize shareholder value and the overall firm value. According to Atiyet (2012), companies that target the maximization of shareholder value enjoy overall productivity. Shareholder value creation is achieved when there is excess on shareholder return over the cost of equity. Stewart (1991) proposed six drivers of shareholder value: net income after taxes, debt tax shield, new capital invested for growth, after-tax return of the new capital investments, cost of capital and the projected length of time over which the company is

expected to recover the return exceeding the cost of capital from its new investments. However, there have been debates as to the most appropriate tool to quantify the creation of shareholder value and wealth to aid in the decision-making of companies. Among the most commonly used measures are economic value added (EVA), earnings before income and taxes (EBIT), market value added (MVA), return on equity (ROE), and earnings per share (EPS).

The relationship between capital structure and firm value has been a subject matter for a handful of empirical research. Throughout the literature, the issue is concentrated on the existence of an optimal capital structure for individual firms or whether the leverage for debt bears significance to the individual company's value. Atiyet (2012) associates the signal theory and the pecking order theory in identifying the effects of a firm's capital structure to shareholder value. Debt serves as a mechanism in resolving managerial conflicts as it prompts the top management to be successful in order to avoid or mitigate the risks of bankruptcy and employee turnovers. Antwi, Mills, and Zhao (2010) conducted a study involving 34 companies in Ghana to further provide evidence on the impact of capital structure on a firm's value. Stulz (1988) and Aggarwal and Kyaw (2006) believe that debt can have both positive and negative effects on the value of the firm. The free cash flows of firms forces managers to pay out the debt that may otherwise have been invested in negative present value projects. On the other hand, firms having an outstanding debt may have incentives to reject projects with positive net present value if the benefit of its acceptance will only accrue to the bondholders without increasing shareholder's value.

DATA AND METHODOLOGY

Congruent with the research objectives, this study is geared towards both an explanatory and exploratory research design. In studying both time variant and invariant capital structure determinants and subsequently analyzing how the optimal capital structure creates shareholder wealth, the primary focus will be on the Philippines, where infrastructural growth and expansion is expected to be fastest relative to other Asian countries.

A total of thirty-five (35) real estate developers are publicly listed in the Philippine Stock Exchange. Relevant cross-section data are obtained from the related entity's respective financial statements. Moreover, only periods covering the common time frame are put into study to establish a common ground. Hence, companies' unique characteristics are observed only for a period of five years, covering 2009 to 2013. Having gathered all data necessary to address the research objectives of this study, the variables, consistent with prior literature, are calculated as follows:

Having gathered all relevant data, computer software, Gretl32, is then utilized in detecting and correcting for any violations on critical assumptions. In particular, tests for multicollinearity, heteroscedasticity and autocorrelation are crucial to ensure subsequently meaningful analysis of results. Models should furthermore be tested for possible omitted variable bias. This is achieved by employing the Ramsey Regression Equation Specification Error Test. After correcting for any violations that would generate non-sensical results, a fixed, long and balanced panel regression operationalized on to capture both inter-temporal and inter-firm effects under the fixed effects model and to analyze the variances in error components of cross-sectional and time-series variables under the random effects model.

Table 1: Measurement of Variables

Response Variable	Static Model Measurement	Dynamic Model Measurement
Debt Ratio	$\frac{Debt}{Book\ Value\ of\ Total\ Assets}$	$\frac{Debt}{Debt + Market\ Capitalization}$
Explanatory Variable	Static Model Measurement	Dynamic Model Measurement
Firm Size	$\ln(Total\ Assets)$	$\ln(Total\ Assets)_{t-1}$
Profitability	$\frac{EBIT}{Total\ Assets}$	$\frac{EBIT}{Total\ Assets}$
Growth Opportunity	$\frac{Market\ Capitalization + Total\ Debt}{Book\ Value\ of\ Total\ Assets}$	$\frac{Market\ Capitalization + Total\ Debt}{Book\ Value\ of\ Total\ Assets}$
Debt Tax Shield	$\frac{(Interest\ Expense) (Tax\ Rate)}{Earnings\ Before\ Tax}$	$\frac{(Interest\ Expense) (Tax\ Rate)}{Earnings\ Before\ Tax}$
Non-debt Tax Shields	$\frac{Depreciation\ and\ Amortization}{Total\ Assets}$	$\frac{Depreciation\ and\ Amortization}{Total\ Assets}$
Family Firm	Dummy variable: 1 = Family Firm 0 = Nonfamily Firm	Dummy variable: 1 = Family Firm 0 = Nonfamily Firm

Specifically, the following procedures are carried out for analyzing the static and dynamic regression model of this study with the help of Gretl32: (1) Ensure consistency in the unit of analysis of each data, (2) transform the short dataset to a longitudinal one before starting any regressions and tests, (3) get the descriptive statistics of the data, (4) construct a graph matrix showing a preliminary view of the data in relation to one another. Ideally, graph should depict a picture of data scattered but close to the mean. Signs of outliers may distort the regression results; hence, this may entail functional transformation of related variables, (5) estimate the equation with the Pooled Ordinary Least Squares method, (6) generate the fixed effects regression model, (7) test to determine whether the fixed effects model should be considered is by conducting the F-test test. Working under a 90% confidence interval, if p-value of any variable is less than 0.10, the null hypothesis is rejected, thereby, favoring the Fixed Effects Model over the Naïve Model., (8) extract the regression for random effects model, (9) test whether the Naïve equation or the Random Effects Model is more appropriate by incorporating the Breusch-Pagan LM test, (10) when both null hypotheses from the preceding two tests above are rejected, conduct the Hausman test, (11) show the goodness-of-fit measure gathered from the coefficient of determination (R^2) to assess how much of the real world is captured by the developed model.

Consistently working under a 90% confidence interval, if p-value of any variable is less than 0.01, 0.05 or 0.10, null hypothesis is rejected and the variable is interpreted to be highly significant, significant or marginally significant, respectively; otherwise, the concerned variable does not impact the dependent variable significantly. Being the case, if the regressor is significant, their individual coefficients are taken to be their respective contribution to the regressand. These steps are employed to address the first and second objectives of this study. Furthermore, relationships between selected determinants involved are studied, wherein regression results indicate to what extent the variables impacts the dependent variable. Moreover, after establishing correlations between the regressors and regressand, past literature and theories concerned are applied to explain the findings. Previously conducted empirical studies are also used to arrive at valuable policy recommendations. After determining the optimal capital structure equation and testing for the true relationship of each variable with another, these values are further analyzed with reference to the theory connecting financial leverage and share price, the purpose of which is to determine the optimal range of capital structure.

Over reliance to debt financing makes a company more prone to bankruptcy (Titman, et al., 2010; Lashes, 2013), offsetting the benefits from tax deductible interest expense. Hence, there is a benefit and a cost associated with debt financing. In order to determine to what extent debt's benefits outweighs the cost, a cost-benefit analysis is employed involving return on capital employed (ROCE) and the after tax cost of debt (Lashes, 2013). The logical flow of the theory suggests that debt financing can be increased as long as ROCE exceeds the after tax cost of debt. This will result to improving ROE and EPS; thus, this leads to optimizing share price. However, when ROCE is outweighed by the after tax cost of debt, more leverage has a negative impact on the share price.

Share price is used to capture shareholder value creation since it is considered as reflective of the value of business and also a good indicator whether companies are achieving their goals (Mauboussin, 2011). Share price is also considered as a long-run shareholder value indicator as it reflects market expectations of future performances (Mauboussin, 2011). Nonetheless, optimizing capital structure is discussed as undergoing a risk-return trade-off to maximize the market price of stocks (Brigham & Houston, 2009; Lashes, 2013). Henceforth, it is hypothesized that as firms habitually practice embracing the optimal capital structure, shareholder value across the firm's industry would increase.

The path analysis generates path coefficients that are essential for determining whether a multivariate set of data is a good fit for a regression model. The relationships tested include those interdependent variables and share price. The detailed information it can generate contributes much to the understanding of the true relationship between these variables. In addition, it identifies the holistic grasp of the importance of optimal capital structure to shareholder value creation in real estate companies. Therefore, the three phases involving this study is an integral part to gaining an understanding and an evidence to prove or disprove assumptions mentioned in the following section.

RESULTS AND DISCUSSION

Descriptive statistics showcase some variables to have high standard deviations. To converge to a normal distribution, three variables (dr, gr, dt) are logarithmically transformed. This subsequently paves the way for a better analysis of results. Static model regression results are summarized in Table 2.

The variance inflation factors, Durbin-Watson statistic and the p-value under Wald's test suggest a model, free from critical assumption violations. Additionally, the Ramsey RESET test serves to indicate that the model does not suffer from omitted variable bias. Hence, with no assumptions violated in the panel data, the static model is fit to be regressed and interpreted on. Moreover, among the three competing models, the Random Effects Model is deemed the best, where it is possible to account for the impact of cross-sectional and time-series variances in errors.

The regression model exhibits all exogenous variables to hold a significant impact on the response variable, capital structure. It is to be noted that the winning model is characterized to have an R-squared of 49.60%. At first glance, the coefficient of determination appears to be relatively low. This may be attributed to the small sample size of thirty-five (35). Had there been a greater number of companies publicly-listed with complete data available to have analytics performed on; the model could have been projected to have a higher explanatory power. However, it is notable that the R-squared values only give a general picture; thus, jumping to the conclusion that the model is inconclusive is invalid. Meaningful relationships and interpretations may still unfold from the regression results.

Table 2: Static Model Panel Regression Results

	MODEL 1 (Wald's p-value = 0.0000; Ramsey test = 0.0007)		NAÏVE MODEL (R ² = 49.60% ; dwstat = 1.73456)		FIXED EFFECTS (R ² = 55.74% ; dwstat = 1.93144)		RANDOM EFFECTS (R ² = 49.60%)

			Breusch-Pagan test stat.		0.04279	FE Model < Naïve Model < RE Model		
			Hausman test stat.		0.14627			

The individual magnitude of impact is captured by the respective coefficients of each variable. In equation form, optimal capital structure is defined as follows:

$$dr = -3.37427 + 0.12831si + 1.48634pr + 0.44756lngr - 0.02893lndt + 3.40146nd + 0.35161ff \quad (1)$$

Table 3 summarizes the alignment of the results with respect to the researchers' expectations. It is notable that some explanatory parameters turned out to be counter-intuitive.

Table 3: A-priori vs Actual Results

Variables	A-Priori	Results
SI	+	+
PR	+	+
lnGR	-	+
lnDT	+	-
ND	-	+
FF	+	+

Given the structured equation, it can be deduced that an increase in firm size encourages greater debt financing. Specifically, a percentage increase in firm size corresponds to a 0.1283% increase in a firm's chance of choosing debt over equity financing. Congruent with the findings of Kurshev and Strebulaev (2006) as well as on a-priori expectations, a company's increase in size connotes its ability to engage in diversification; hence, its greater funds availability to enter into borrowings arrangement.

An increase in profitability will also direct real estate firms towards leveraging on debt. In particular, a unit-increase in the profitability ratio will influence companies to increase debt-financing by 1.4863%. This buttresses the trade-off theory, showcasing the offsetting nature of risks and additional costs incurred under debt-financing to the tax benefits that will arise from tax-deductible interest payments. Moreover, growth opportunity is gathered to be a determinant of a firm's financing decisions. An increase in growth opportunity by 1% signals a 0.4476% increase in firms' favor towards debt leverage. Furthermore, although this is in opposition to the expected relationship, the direct correspondence of growth opportunity is

grounded on the pecking order theory. This framework suggests that firms experiencing robust growth are typically in greater need of finances. As supported by Titman and Wessels (1988), this will translate to higher debt ratios, given management's hesitance on issuing greater equity.

Furthermore, debt tax shields are analyzed to marginally push firms towards equity financing such that for every 1% increase in debt tax shield, real estate companies are influenced to reduce debt financing by 0.0289%. Although counter-intuitive, this is found to be congruent with the findings of DeAngelo & Masulis (1980) who argue that firms may resort to other forms of tax shields, such as depreciation. Results are furthermore reinforced by Modigliani & Miller (1963)'s findings, where conclusions lean towards firms moving towards cheaper sources of financial income.

Meanwhile, non-debt tax shields are also evidenced to significantly influence a firm's activity-financing decisions. In opposition to initially expected variable relationship, the positive relationship indicates that firms rely on non-debt tax shields, such as depreciation, with the motivation of reducing their taxable income. Congruent with the study conducted by Getzmann, Lang, & Spremann (2010) in their examination of fifteen Asian markets, including the Philippines, this is a living evidence that tax arbitrage is prevalent in the Philippines real estate industry. More particularly, an increase in the non-debt tax shield, as measured by depreciation over total assets, will encourage firms to engage in debt financing activities by approximately 3.4015%.

Finally, congruent with the findings of Lopez-Gracia and Sanchez-Andujar's (2007), a firm's characteristic of being a family-owned corporation is found to possess a positive relationship with debt-financing. Hence, leveraging on debt is 35% higher when firms are family owned. This could be associated with firms' easier access to long-term debt via decrease in asymmetrical information. Having looked into the static model, where book values are used as measures to capture the current standing of real estate companies, the results for the dynamic model will now be discoursed. Using market values, this model reflects how firms are valued in the market; hence, it is relatively more futuristic than the initial model. Table 4 summarizes the dynamic model regression results.

Table 4: Dynamic Model Panel Regression Results

	Model 2 (Wald's P-Value = 0.2109; Ramsey Test = 0.1643)	Naïve Model (R ² = 66.39% ; Dwstat = 1.68560)		Fixed Effects (R ² = 72.30% ; Dwstat = 1.97897)		Random Effects (R ² = 66.39%)

	Breusch-Pagan test stat.		0.05896	FE Model < Naïve Model < RE Model			
	Hausman test stat.		0.74464				

Test statistics indicate a model free from critical assumptions, other than homoscedasticity. Using the

robustness function, interpretations may then be made. It is notable that the coefficients of determination are better under the dynamic model relative to the static model. It is to be noted though that although it appears to be a model with greater capabilities of capturing the real world, p-value for the Ramsey test suggest biasness due to omitted variables. Hence, the static model may still prove to have greater explanatory power. Having verified that the static model is BLUE, we utilized Path Analysis to determine the order of sensitivity of the capital ratio to these determinants in view of creating shareholder value. From this, it can be inferred that a firm adopting the optimal capital structure has a stronger correlation with share price. Also the order of sensitivity of these variable come first with growth opportunity, size, profitability, family firm, non-debt tax shield, and debt tax shield.

CONCLUDING COMMENTS

The property industry has continually driven the Philippines towards achieving economic growth. Being a major contributor to the gross domestic product of the country, many stakeholders have come to benefit and depend on the real estate sector in their everyday living. It is thus imperative to ensure sustainability for this industry. The magnitude contribution of each parameter is further analyzed in the study of arriving at the optimal capital structure. Specifically, the following determinants were looked into: firm size, profitability, growth opportunity, debt tax shields, non-debt tax shields, as well as family ownership characteristic of firms. Overall, this paper intends to analyze how companies' optimal capital structure can ultimately impact shareholder wealth favorably. To get a picture of optimal capital structure drivers in the Philippine real estate industry, as represented by the sample size of thirty-five (35) publicly-listed companies, cross-section panel regression analysis was employed. Path analysis, a method of testing the model and not of model development (Field, 2009), further allowed the researchers to see through the details of correlation and causation. This serves as a useful guide to companies hoping to operate or continuing to be in the range optimal capital structure and a tool to create shareholder value in the most effective way. Regression results provide evidence that all variables propose a significant bearing on companies' choice of debt or equity financing. Dissection of the direct and indirect effects of each exogenous variable demonstrates that each factor stimulates firms in their financing decisions by varying degrees. Findings indicate that growth opportunity encourages firms the most towards engaging in borrowings arrangement. Size, profitability, family firm characteristic and non-debt tax shields are evidenced to drive debt-financing as well, where impact of contributions is ranked correspondingly.

The direct correspondences paint a picture on the ability of the firms to be enveloped by different diversification mechanisms as it expands. Such is buttressed by the trade-off theory where tax arbitrage is evidenced to be perpetrating in the Philippine real estate industry. In line with diversification, real estate industries do not just enter into arrangements that will yield them tax savings; they are demonstrated to resort towards other sources of cheaper financing as well, but not at the expense of eliminating tax savings from debt issuance. From this, it can be inferred that the real estate industry is primarily concerned, not with profitability, but rather with liquidity for expansion purposes. Another finding pertinent to this study is the nature of debt and non-debt tax shields. Analysis of results suggests these two variables to be substitutes of one another. As non-debt tax shields encourage greater debt-financing, debt tax shields push real estate companies towards debt reduction. It is worth noting though that the substitution effect prevalent is not in inversely equal proportions. The impact of non-debt tax shields is significantly greater than the debt reduction influence posed by debt tax shields.

ON THE SCARCITY OF RESEARCH INTO THE INFORMATION ROLES INDIVIDUALS TAKE IN ORGANIZATIONS

Julien Pollack, University of Technology, Sydney

ABSTRACT

Organizations are information processing organisms, admitting information from outside the organizational boundary, then taking action in the world in response to that information. The various ways that employees treat information are key contributors to an organization's ability to respond to external information in a timely and effective way. The role of the gatekeeper has been the subject of a substantial body of research in the knowledge transfer and social network literature. However, there has been a surprising silence in these fields about other information roles that individuals take, and how these contribute to an organization's ability to absorb and process information. Review of the marketing literature has revealed that specific roles have been identified which contribute to the ways that markets respond to new products, and these roles may have analogues within organizations. Review of the systems theory and cybernetics literature also suggests a role that individuals may play in the way that organizations process information. These observations lead to the proposal that research is needed into the different information roles that individuals play in organizations, and how these contribute to an organization's ability to take action in response to a changing environment.

JEL: M100, M500

KEYWORDS: Gatekeeper, Social Networks, Information, Organization

INTRODUCTION

Organizations can be considered information processing entities, taking in information from outside the organizational boundary, and taking action in the world in response to this information. There is an ongoing process where the people who make up an organization perceive something to be of potential relevance, transfer it between each other, and transform it into something more than it was. They individually and collectively interpret the information in light of their personal experiences, the cultural norms of comprehension present within the organization, and whatever information has been encoded in available repositories, all of which contributes to the organization taking action, both internally and externally. Other authors have also regarded organizations primarily as organisms which exist to handle and process information (Daniel, 1982; Macdonald & Williams, 1993), with their primary function being to control the collection, storage, use and flow of information (Macdonald & Williams, 1994, p. 124).

Elements of an information focus on organization can also be seen in Morgan's (2006) brain and organism metaphors of organization, with the former focusing on internal information processing, and the latter drawing attention to the relationship between the organization and to its environment (Müller et al, 2010, p. 2129). The knowledge management literature (Argote et al, 2003), and more specifically the knowledge transfer subset of this literature (e.g. Ceccagnoli & Jiang, 2013; Chang et al, 2012; Klarl, 2014; Patriotta et al, 2013), and the social network analysis literature (e.g. Tushman & Katz, 1980; Zhu et al, 2010) have both investigated individuals' roles in the information flow within organizations, intersecting at investigating the relational and structural factors that affect the process of knowledge transfer. Research contributing to these literatures has often focused on the role of the gatekeeper; an individual who has an unusually large number of internal and external contacts, and who takes an active role in sourcing external information and

ensuring that it can be absorbed and applied internally. However, review of these literatures reveals that few other information roles have been considered, suggesting that our understanding of the various roles that individuals take in the system of organizational information processing may be far from complete.

Organization As a System of Information

When viewing an organization as a system that processes information (Checkland & Holwell, 1998), it is important to account for different levels of abstraction, from the individual, to the team, and the organization as a united whole. From the first of these perspectives, all employees bring external information into the system. Employees come with particular educations and work histories. They bring their experiences from competitors and collaborating organisations. They read articles in the newspaper on the weekend for pleasure, not just for any obvious contribution to their working lives, and are sometimes surprised when unexpected and useful connections are made. While some may question whether much of this has an impact on organizational activity (Macdonald & Williams, 1993, p. 419), these external factors inform each employee's world view. They form a tacit underlay to everything that is interpreted in the workplace. The flow of information may be facilitated by electronic systems and processes, some of which may capture and distill individual's experience, but the knowledge of an organization is not compact, discrete and easily accessible. It is incomplete, often contradictory, and embodied in the knowledge of the employees of that organization (Patriotta et al, 2013, p. 515).

Organizations can be seen as are devices for creating order conducive to the operation of their business (Macdonald & Williams, 1993, p. 417). When an organization becomes habituated towards repeatedly treating particular kinds of information, there is a tendency towards homeostasis. Part of this tendency is embodied in the formalization of communication channels. "Formal mechanisms are boundary-making devices designed to restrict the free flow of knowledge and generate efficiency" (Patriotta et al, 2013, p. 516). Formal mechanisms assist in ensuring that selected information reaches the intended destination, while also creating efficiencies, and reducing the costs and delays involved in information transfer. However, the more proficient an organization becomes at processing and transferring familiar kinds of information, the less capable it will become in dealing with the unfamiliar (Macdonald & Williams, 1993, p. 418). An exclusive emphasis on continuous improvements in information efficiency would only be sustainable if it were possible to assume that the types of information that the organization previously relied upon would continue to be relevant into the future; a problematic assumption on which to hold.

The formalization of communication between groups within an organization may allow for more efficient communication of pre-determined information, but it also creates and reinforces divisions. Tushman and Katz (1980, p. 1072) have identified that as a natural result of a group of people working together over an extended period of time, a localized orientation and linguistic referencing scheme develops in specialized units. This provides information efficiencies. A commonly shared short-hand and set of symbols, provides a common language which can speed communication. However, it also creates impedances for communication with those who do not share the same scheme. A local scheme will facilitate local communication, but impede external communication. The formalised aspects of the system of information within an organization facilitates the development of local communication schema, especially if employees rely on it as a primary means of communication with those outside the local group. These factors lead to an ongoing need for individuals to selectively deviate from standardised information transfer procedures whenever non-standard information is required.

The Gatekeeper

The role of the gatekeeper has been the subject of a substantial body of research. The term 'gatekeeper' has been used from 1947 to refer to an individual who selectively directs information in a similar way to that of gates in electronic circuitry (Macdonald & Williams, 1993, p. 420). The term refers to a person who

sources information from outside an organization, and selectively and effectively applies it within the organization. The gatekeeping role implies more than an ability to find information that may be useful. They must also be sufficiently connected to disparate parts of the organization to understand how it could be applied. "Gatekeepers are those key individuals who are both strongly connected to internal colleagues and strongly linked to external domains" (Tushman & Katz, 1980, p. 1071). A gatekeeper will actively decide to source and obtain information outside their organization, which may be applied to their own, or others', ends (Macdonald & Williams, 1994, p. 123), and the role has been described as one which scavenges useful information from external sources (Macdonald & Williams, 1993, p. 417). From a network perspective, gatekeepers will sit in key positions between network subgroups, and will typically be nodes in a network with a high betweenness centrality, where betweenness centrality is a network measure of an actor's influence in a network (Zhu et al, 2010). To refer to Granovetter's (1973) research on the importance of weak ties, gatekeepers are individuals within an organization who are likely to hold a significantly higher than average number of weak ties to connections both inside and outside an organization, and thus will be placed to effectively spread information throughout a network.

The gatekeeping role is typically described as a two step process. In 1980, Tushman and Katz (Tushman & Katz, 1980, p. 1073) identified that gatekeepers first need to be able to gather and comprehend information from external sources, and then to communicate this information in a way that is accessible to colleagues who are internally focused and can make use of the information. This description of the gatekeeping process, and intermediation in general, appears to have remained quite stable, with the process subsequently being described in 2006 as one of "...the information scanning and gathering function and the communication function..." (Howells, 2006, p. 718), and in 2014 as being "...two core roles, knowledge search and knowledge transfer" (Mitchell et al, 2014, p. 2199). It is perhaps because of this consistent regard for the role's ability to source and disseminate information that would otherwise be unavailable to other actors in an organisation that this role has been considered by many as a vital part of an organization's ability to innovate.

In order to select and source information that could be of relevance to a particular issue faced by their organization, it has been identified that the gatekeeper must be knowledgeable about their area, however opinions vary about the level of expert knowledge that is required to function well in the role. While Allen (1977) is of the opinion that gatekeepers will be highly knowledgeable and skilled specialists, Macdonald and Williams (1994, p. 123) describe the gatekeeper as an expert in establishing contacts. They regard the role as requiring sufficient understanding to recognize what may be valuable, but not necessarily subject matter expertise. However, it is consistently identified that a gatekeeper must be able to translate between disparate coding schemes (Tushman & Katz, 1980, p. 1073); to take information from outside the organization and transform to align with the world-views of the recipients, delivering it in a way that insiders will assimilate and utilize (Morrison, 2008; Mitchell et al, 2014, p. 2199).

It has been suggested that gatekeepers' motivation for passing information on to other members of an organization may be that the timely provision of useful information provides a source of power (Macdonald & Williams, 1993, p. 425). More generally, it has been found that people who occupy structural holes in an organization, positions where there are few other routes through which communication can flow, gain social capital such as higher compensation and more positive evaluations of their performance (Burt, 2004; Schiffauerova & Beaudry, 2012, p. 283). Keller's (1991, p. 9) results also demonstrate that gatekeepers' performance was regarded as higher, and that they tended to report a greater job satisfaction. However, gatekeepers' motivation does not appear to be covetous, as it has also been noted that gatekeepers do not necessarily act to preserve a position of remaining the sole avenue for communication with an outside source. Tushman and Katz' (1980, p. 1080) research has shown that a gatekeepers involvement in projects helps to develop the abilities of the rest of the project team to directly communicate with external sources. This suggests that if gatekeeping is undertaken as a way to gain power, it is the newness and immediate efficacy of the information that is valued, rather than exclusive possession of relationship. Gatekeepers also

provide other benefits. Due to their ability to overcome informational impedance by translating between disparate groups, they reduce interpretive bias and distortion (Tushman & Katz, 1980, p. 1074). In addition, gatekeeping has been identified as an important role that high-level managers must play; one which becomes particularly critical for an organization with a global workforce (Patriotta et al, 2013, p. 515). However, the need for, and benefits from, gatekeepers have been found to be far from ubiquitous.

Tushman and Katz (1980) have linked the benefits of gatekeeper involvement to different project types, finding that gatekeepers only provide significant benefit in projects where there is a significant informational impedance. For instance, in projects where there may be a universally understood language between internal and external actors because of a specialist application area there is less of a role for gatekeepers. In these cases, gatekeepers may actually impede progress. The majority of research into gatekeepers appears to have focused on their role in organizations where there is clear competitive advantage to be found in the ability to rapidly source and apply information from outside an organization. Although this ability could, of course, be suggested to be of benefit to any organization, it would be of particular value in industries where competitive advantage depends more on being at the forefront of technology, than in the efficient application of technology.

For example, R&D performance has been shown to be dependent on a few key individuals who act as gatekeepers (Schiffauerova & Beaudry, 2012, p. 284), with a significant body of research on gatekeepers focusing on R&D and innovation (Allen, 1977; Tushman and Katz, 1980; Katz and Tushman, 1981; Patriotta et al, 2013, p. 517; Schiffauerova & Beaudry, 2012, p. 283); the role of gatekeepers in high-technology firms (Macdonald & Williams, 1993); and product design (Hargadon & Sutton, 1997). Foster et al (2011) provide an interesting study of gatekeepers in the live music industry, where the need to remain constantly aware of a changing market significantly affects performance. Another contrasting study has been provided by Mitchell et al (2014) who have examined the roles that technological gatekeepers and social capital play in how small to medium enterprises in the wine industry access information outside their local clusters. It has been identified that gatekeepers work "...in a markedly different way from the mass of their colleagues. These key employees are most evident - and have been most studied..." (Macdonald & Williams, 1993, p. 419).

The majority of research on gatekeepers has focused on industries where there are clear needs to surmount significant information impedance and to remain au fait with the changing environment, such as R&D and technological innovation. Early studies into gatekeeping in these environments has demonstrated that gatekeepers play a key role, and this appears to have contributed to the popularity of research into this topic, with organizations using the gatekeeper concept as a way to capitalize on communications channels that might span multiple groups (Zhu et al, 2010, p. 153). Perhaps as a consequence of the popularity of research into this role in these industries, there has been little research into industries where gatekeepers are not so obvious. This may potentially be because gatekeeping activities are more common and thus stands out less, or because the benefits of gatekeepers are less easy to identify as significant when compared to those of their colleagues. In addition, there has been comparatively little research that has investigated other comparable kinds of roles.

Comparable Roles to that of the Gatekeeper

A variety of studies have identified roles which are similar to that of the gatekeeper, or have provided further sub-categorization within the gatekeeper role. For instance, Patriotta et al (2013, p. 522) found it necessary to distinguish between the knowledge transfer, auditing and dissemination roles that high-level managers play when acting as a gatekeeper. Furthermore, the study by Foster et al (2001) identified three different roles that gatekeepers took in the live music industry, namely those of selector, tastemaker and co-producer. This emphasizes the roles that gatekeepers may play in shaping the industry itself, by forming unions between venues and some artists rather than others, and thus creating audiences for music that may

otherwise have been inaccessible to the consumer. Gould and Fernandez (1989) have instead focused on brokerage, which bears strong similarities to gatekeeping when it is information that forms the basis of the brokerage agreement. Their review of network configurations has revealed five types of brokerage relations that can result from separating actors into sub-groups that do not overlap:

Coordinator – internal brokerage, where all three actors are members of the same group;

Itinerant broker – the two principals belong to the same group, while the broker is from outside;

Gatekeeper – where the broker decides whether not to allow an outsider access to their group;

Representative – where the broker attempts to establish access for someone from their group with another group; and

Liaison – the broker links two separate groups, without any particular ties to either.

A similar concept to gatekeeping is also raised by Obstfeld (2005), based on social network research. Obstfeld terms this role, ‘Tertius Iungens’ (or ‘third who joins’), and created it in contrast with the ‘Tertius Gaudens’ (or ‘third who rejoices’) concept from structural holes theory indicating one who benefits from conflict between other parties. The ‘Tertius Iungens’ role focuses on connecting people in a social network, and facilitating interaction between people who would otherwise not have the opportunity to interact. This role supports both parties’ participation in knowledge transfer, joining peoples’ experiences and ideas (Patriotta et al, 2013, p. 517). The role bears strong similarities to that of the gatekeeper, although the emphasis in the role of the ‘Tertius Iungens’ seems to focus more internally than the gatekeeping role.

Other studies have interpreted the gatekeeping role in a different way, focusing on the ways that organizations act as gatekeepers in a geographic cluster or in a supply chain (Schiffauerova & Beaudry, 2012, p. 282). One example is Howell’s (2006) research into the information intermediary roles that organizations play in innovation. This research identified ten different functions, only one of which was the combined role of gatekeeping and brokering. However, many of the functions identified in this research were specific to organizations, making it difficult to extend this research to a discussion of the information roles that individuals play in organizations. Readers are referred to the following as other examples of studies that investigate the ways in which organizations act as gatekeepers (Fernandez & Gould, 1994; Burt, 1992; Stuart et al., 2007).

Although studies continue to be published examining gatekeeping in different industries, our understanding of gatekeeping does not appear to have significantly developed from that in studies published in the late 1970’s and early 1980’s. Although studies continue to find the role useful, it appears that the popularity of this role as a subject of research has declined, with Macdonald and Williams commenting in 1994 that “Much less is heard of gatekeepers these days...” (1994, p. 123). In addition, our understanding of any other information roles that individuals play in organizations does not appear to have significantly developed. For instance, after a substantial review of the knowledge transfer and social network literature, Patriotta et al (2013) used the following coding categories in their research: knowledge search; knowledge transfer; knowledge coordination; networks; strong/weak ties; gatekeepers; source/recipient; knowledge re-use; barriers; formal/informal mechanisms; process/practice; boundaries. Of these categories, only ‘gatekeepers’ could be considered an organizational role that individuals take. However, it is unlikely that there is actually only one information role that individuals actually take in organizations. This suggests that there may be other information roles that are not yet being researched.

MARKET ROLES

Some attention to individuals information roles can be seen in the marketing literature, with a particular attention to identifying types of individuals that play a role in the dissemination of information through a market. This field has primarily focused on three roles: opinion leaders; early adopters; and market mavens (Godes et al, 2005, p. 418). Of these, opinion leaders and early adopters have been found to influence others

because of their knowledge or expertise with a specific product. For opinion leaders, their influence has been found to come from knowledge of a specific class of products, while influence for early adopters comes more from their usage of a specific product (Feick & Price, 1987).

Market mavens play a different kind of role in the diffusion of information through the market. Instead of having detailed knowledge of one product class, market mavens are "...individuals who have information about many kinds of products, places to shop, and other facets of markets, and initiate discussions with consumers and respond to requests from consumers for market information" (Feick & Price, 1987, p. 84). The maven's role is network focused, but the role does not just focus on selectively transferring information to those who may find it useful, as a gatekeeping role might. Pomson (2008) has found that a distinguishing characteristic of mavens is that they also add their opinion and assessment to any transferred information. Other distinguishing characteristics of the maven are that they provide information to others across a wide range of products, are interested in changes in the market, and know about new products earlier than their peers (Feick & Price, 1987, p. 93).

Mavens have been the focus of a considerable body of marketing research in the apparent expectation that the ability to identify and connect with mavens will improve an organization's ability to disseminate information to their market. For instance, Walsh et al (2004) investigated mavens' motivation to disseminate information, while Goodey and East (2008) have explored personality traits associated with mavenism. Walsh and Elsner (2012) have quantified the role that mavens play in other consumers' purchasing decisions, and mavens' roles in online and virtual communities has also been the subject of research (Barnes & Pressey, 2012; Laughlin & MacDonald, 2010). The role that mavens play in a market has been consistently established. However, the role that mavens play in the processing of information within organizations is not clear.

Gladwell's (2000) research on social epidemics has extended the maven concept by investigating the interplay between this role and two others, that of the salesman and the connector. Salesmen are people who are particularly skilled at persuading people who are as yet unconvinced about an idea (Davenport, 2011, p. 89). Degen (2010, p. 10) alternatively identifies them as 'influencers', noting that they have a particular skill in winning others over to their point of view. In contrast, the connector is a person with access to many different social groups, bringing people together who might not otherwise have been able to connect (Davenport, 2011, p. 88-9). Pomson's (2008) research into electronically supported social networks has noted that connectors focus on trading their knowledge, both of resources and sources. Although descriptions of the connector role do not focus on the connector's relationship to a group or organization, the role does bear similarity to the gatekeeping role discussed above.

A key factor way in which Gladwell's (2000) research extends these concepts is the emphasis he places on the necessary interaction between these roles in propagating a social epidemic. While a maven may be aware of a new development, they may not either be sufficiently well connected within a social network to disseminate the information, and may not be sufficiently convincing to entice others to act on the information. However, working in connection with connectors and salesmen, a maven's information can be more easily and effectively distributed (Degen, 2010). "Mavens know a lot about a certain thing. Connectors know a large number of people. And salesmen persuade others to adopt a behavior that they themselves believe in" (Craig et al, 2009, p. 190).

Research into the relationship between these roles has not developed to the same frequency as marketing research into mavens, however these roles have been used to investigate the spread of the Occupy Wall St. movement (Davenport, 2011, p. 88), the increasing frequency of research into family businesses (Craig et al, 2009) and economic development programs (Reid et al, 2007). Other research has also developed on these roles. For instance, Pomson's (2008) inductive research into participant roles in an electronic social network found it necessary to add the roles of promoter, provocateur, stoker and good citizen to the maven

and connector roles in order to explain participants' behavior. Hoffmann (2014) also built upon Gladwell's (2000), and others', roles conducting an extensive literature review of these and similar concepts, synthesizing them into three groups of roles with respect to their contribution to product trends:

Inventors: people who design and devise new things, ideas, or behaviors;

Multipliers: people who disseminate new ideas; and

Trend observers: people who research and identify changes in a product or market.

The roles of salesmen and connectors were both included in the category of multipliers, while mavens were included in the category of trend observers. This research was conducted with the intent of identifying a fourth role, trend receivers, people who are able to identify early trends in a product line and may contribute to a long term view of future customer needs. Trend receivers were identified as individuals who see the potentials in a domain, with an interest in they dynamics of change and new influences; a role that was identified to be of particular interest to organizations wanting to anticipate change to a market. Research conducted in the marketing literature has identified roles which contribute to the ways in which markets and social groups respond to new information, with a particularly functionalist perspective; an attempt to understand how a chosen message can be most effectively spread through a population, and how to make this message as influential as possible. It is possible that comparable roles contribute to the ways in which organizations take in information, process it, and take action in response, but there does not appear to be any research which directly examines this possibility.

Organizational Noise

Organization naturally reduces information noise through the creation of formal communication channels. "Systems are characterized by principles of exclusion – difference, disharmony and chaos, are eliminated... Organizations exist by excluding alternatives; they push the noise outside of their boundaries" (Letiche, 2007, p. 197-8). Nonetheless, from an information perspective, organizations remain noisy places. Email, electronic chat and messaging systems, bulletin boards and intranets all facilitate the creation of information noise. Willmer (1977) distinguishes between noise created by internal message loss or corruption, and noise as a result of relevant information not taken in by an organization. However, there is a third kind of perceived noise; that created by access to a profusion of information which may, or may not, be relevant.

Noise is not necessarily a negative influence. Fuchs and Hofkirchner (2005) highlight the importance of von Foerster's (1960) principle of 'order from noise' in the generation of self-organizing systems like organizations. This principle suggests that "...a self-organizing system feeds upon noise..." (von Foerster, 1960, p. 11). It may not always be clear what information is needed to solve a novel organizational problem, and creative solutions can come from the union of between unexpected ideas. However, while some may be able to filter out background noise and extraneous data, this ability will have limits, and those who cannot quickly grasp what is relevant to a changing situation may become lost in the apparent chaos and complexity of an organizational problem (Koskinen, 2013, p. 354).

Formal systems of communication are inflexible. They are unable to filter noise from informal sources, or filter out irrelevant information which has found its way past a formal communication system's selection criteria. This suggests that there is a need for dynamic noise reduction within an organization, actively selecting which information is passed on to other people, so that the recipients can more effectively focus on information that will be relevant to their task at hand. Executive assistants will do this on a regular basis, limiting access to executives to ensure that only relevant appeals to their attention take up their limited focus. Similarly, the consolidation of reports as they move up the organizational hierarchy is a process of filtering out information that is relevant for operational, but not strategic, discussion. This suggests that with respect to the information roles that individuals take in organizations, there is a filtering role which focuses on the dynamic reduction of noise, so that those they pass information to can be more assured of

receiving relevant information, and thus spend less of their time sorting the relevant information from the noise.

DISCUSSION AND CONCLUDING REMARKS

Gatekeepers have been examined extensively in the knowledge management and social network analysis literature, but there has been minimal examination of other information roles that people take in organizations. The marketing literature has examined roles that individuals take in disseminating information through markets, but there is little which examines whether similar roles exist in organizations. However, a brief consideration of how information noise is discussed in the systems theory and cybernetics literature suggests that some people take the role of information filters in organizations. This role does not appear to have been the subject of any significant research, suggesting that our understanding of the information roles that individuals take in organizations, and our understanding of how organizations act as information organisms, remains limited at best.

To return to Morgan's (2006) image of the organization as a brain, we might consider the employees of an organization to be analogous to one of many types of neurons, all connected by a communicative network. Granular research into the behavior of a single type of neuron will be limited in what it can tell us about the behavior of the system. An information perspective on organization should be concerned with the neurons only in so far as they reveal insight about how they operate together to create the emergent behavior of the brain perceiving, thinking, and directing action. Gatekeepers, and their variants, have been studied extensively because they are visible, but in trying to understand how the brain works, it would be absurd to only study the one type of neuron most obvious to our instruments. Further research is needed to examine what other kinds of information roles there are in organizations, how they relate to each other, how they come together to contribute to the organizational processing of information.

PUBLIC OR PRIVATE BANKS? A PERFORMANCE ANALYSIS IN THE EUROZONE

Simona Alfiero, University of Turin
Francesco Venuti, University of Turin

ABSTRACT

The aim of this paper is to develop an empirical research on the nature and consequences of corporate governance on Eurozone banks before and after the crisis of 2007/2008 and the wide changing in the rules and the regulator activity. More particularly, we analyzed the effect of public ownership on banks performance (profitability and efficiency) with respect to privately held banks in the Eurozone. Our results provide quite strong evidence that, coherently with the Agency Theory, publicly traded banks are less profitable and less efficient than the corresponding privately held. No significant changes seem to have occurred on this point from 2005 and 2013.

JEL: M41, G32

KEYWORDS: Banks, Corporate Governance, Performance Measurement, Public Company, Agency Theory

INTRODUCTION

In the last decade, a well-known wide international crisis and the turmoil in financial institutions, that started in 2007 precisely in the banking sector, has affected in some way all the biggest economies in the world and is frequently described as the most serious crisis since the Great Depression (Kirkpatrick, 2008). The crisis in the subprime market (mainly in the US) and the “credit-crunch” phenomenon that followed (liquidity squeeze) is still having nowadays a relevant impact on financial institutions and banks in many Countries. Kirkpatrick clearly stated that “the financial crisis [of the last decade] can be to an important extent attributed to failures and weaknesses in corporate governance arrangements” (Kirkpatrick, 2008). Also the Basel Committee on Banking Supervision (BCBS), in the 2014 revised edition of “Corporate Governance Principles for Banks” clearly stated that “effective corporate governance is critical to the proper functioning of the banking sector and the economy as a whole”.

As a consequence, strictly related to the financial crisis in the banking sector, new and more severe rules have been introduced, both at national and an international level. Among these, probably the most important is related to the Basel Agreements.

THEORETICAL BACKGROUND

The theoretical background for our study, inside the framework of corporate governance, mainly refers to the Agency Theory and the Stakeholders Theory. Both those theories have broad implications in many field of study and have been a topic of significant interest in recent corporate governance literature. The question of why some entities perform better than others has been largely studied, with some important results and findings, even though no definitive evidence has been clearly defined. Many studies have analyzed whether or not (and how) corporate governance elements affect firms performances. Most of the literature investigating the importance and role of corporate governance is focused mainly on industries rather than on the banking industry or financial services sectors. Only recently an increasing attention has been paid on this topic specifically for the banking sector. The Basel Committee on Banking Supervision (BCBS) defined “corporate governance” for banks in the glossary of its 2014 document “Corporate Governance Principles for Banks” as the “set of relationships between a company’s management, its board, its

shareholders and other stakeholders which provides the structure through which the objectives of the company are set, and the means of attaining those objectives and monitoring performance. It helps define the way authority is allocated and how corporate decisions are made”.

Regarding how corporate decisions are made, according to the Agency Theory, there is a potential conflict between stakeholders and managers, which is prominent in all modern companies, no matter their sector of activity. The shareholders (or stockholders), as owners of the companies, are obviously the ‘principals’ that delegate the management of their companies to managers and executives, which are the ‘agents’ (Jensen and Meckling, 1976). Already in 1932, in the well-know first edition of their book, Berle and Means pointed out clearly that in modern companies those who legally have ownership (the shareholders) have been separated from their control by the managers and that the interests of those two “players” may diverge significantly. The owners of a company expect obviously that the managers make decisions in the principal’s interest, but, mainly due to information asymmetry, the agents do not behave in the best interest of the owners, clearly leading to agency problems (Clarke, 2004).

In other words, executives of a company might sometimes take decisions and act to benefit themselves at the expense of the firm’s investors (shareholders). According to the theoretical framework, control of the company ultimately rests with shareholders as they elect the board of directors, who, in turn, hire and fire executives. The mechanism by which unhappy shareholders may react to replace existing management is generally called a ‘*proxy fight*’. But there may be also other ways for managers replacement. For example, companies that are very poorly managed become more attractive for new investors in the market than well-managed firms and consequently acquisitions may take place due to the existence of greater profit potential. More modern managerial theories assessed that firms managers usually have objectives that are not simply financial year profits maximization, but there is a divergence in managers and majority shareholders (or just controlling interest) on one side and minority owners on the other.

Both the managers and the owners have a shared interest in increasing the firms value over time, but divergence may appear in the choice of which variable maximize (sales, revenues, profit, market share, stock market value?), how much profit should be distributed as dividend (or reinvested as retained earnings) and also the definition of the time horizon. In different ways, Baumol (1962), Marris (1964) and Williamson (1983) developed theoretical models that explain how managers seek their own personal prestige and higher company salaries by trying to expand company sales (revenue maximization) and market shares. Moreover, there is a minimum profits that serve as a constraint on the maximization of the company’s revenues. This is the reason why recent literature on corporate governance has shown great attention to the problem of the “separation of ownership and control”, mainly in public companies, in order to promote improvements in corporate efficiency. In order to mitigate the agency problem of the conflict between managers and shareholders, the existing literature proposes several solutions, such as compensation contracts, strong monitoring by the board of directors and managerial equity investment.

Some studies showed that public ownership may provide some help to the agency problem and may facilitate the market for corporate control. The idea is that listed companies benefit from the examination of the public markets and market corporate control and this situation may reduce the agency problems more in public than in private firms (Manne, 1965; Jensen, 1993; Holmstrom and Tirole, 1993; Dow and Gorton, 1997; Gupta, 2005; Edmans, 2009). Anyway, it should be pointed out that, opposed to the US system, in the European Union, private firms face the same reporting requirements as public companies. Thanks to the extensive disclosure requirement for European Companies (and, moreover, for banks) it is possible to benchmark public firms with private ones.

Stakeholders Theory clearly showed the importance of companies accountability to a wide range of stakeholders, that are far more than simply the majority shareholders (Freeman et al., 2004; Brunk, 2010).

Previous empirical studies that have found evidence of the effect of corporate governance on firms performance may be divided in two group. The first set includes studies that consider samples of firms from a cross section of industries, while the other set include all those researches that are linked with certain corporate events (such as leverage buyouts LBOs or Initial Public Offerings IPOs), see for example Edgerton (2011).

As the banking sector is very complex and strictly regulated, both at national and international levels, corporate governance of banks is quite different from that of unregulated and/or nonfinancial firms. Ciancanelli and Reyes-Gonzalez (2000) stated that the agency problem and the owners-manager conflict in banks is far come complex in its intrinsic nature than in other companies. One important reason of the difference with other industries is that, according to the stakeholders theory, the number of parties with a significant “stake” in a bank is higher and complicates the governance (for example, in addition to “traditional” investors, also depositors and regulators have a direct and strong interest in bank performance). For instance, Commercial Banks present a much more complex structure of information asymmetry coming from the presence of strict regulation frameworks. Moreover, regulators may also set rules in order to reduce blockholders’ incentives to monitor the boards of banks. Finally, another point can be find in the fact that banking firms usually present higher leverage than nonfinancial firms and this may also affect governance problems. For a good and more complete review of existing recent literature on banking see Wilson et al. (2010).

Table 1: Ownership and Property Concentration

Ownership	
<i>Private</i> Households, Firms, Institutional Investors, Banks, workers, employees, depositants (Credit unions or Co-operative Banks)	<i>Public</i> Government
Property Concentration	
<i>High</i> Company controlled by (majority) owners (controlling interest)	<i>Low</i> Company controlled by managers and executives

This table synthesize the different possible ownership structures and the degree of property concentration.

Relevance of this Study

The banking system is widely considered as one of the most important elements of all the modern economic systems. Economic growth, industrial expansion, efficient capital allocation largely depend on the efficiency of the financial sector (and banking more specifically). *Theory and evidence* show that when banks and financial institutions effectively and efficiently mobilize and allocate financial resources, through the interest rates, savings and investments are stimulated, more resources are attracted and a positive effect on economic growth and on the entire economic system is quite evident (Levine, 2004). In other words, “*Banks’ safety and soundness are key to financial stability, and the manner in which they conduct their business, therefore, is central to economic health*” (BCBS, 2014). *Conversely, governance weaknesses in banks may convey problems across the banking sector and the economy as a whole.* The increased attention on risk, its management and the responsibilities of different parts of the organization for addressing and managing it, may have weakened the attention on other aspect of corporate governance in the banking sector that may still be relevant and not completely studied and examined. Our study differ from previous studies because:

it focuses only on the banking sector (i.e. only a single industry) and not on a cross section of industries;

it considers the banks of the Eurozone (and not only those of a single Country, as done by other studies). In the Eurozone during the last two decades a great convergence in rules was developed and common capital market settings has been largely adopted, under the supervision of the European Central Bank (ECB); it does not refer only to certain specific corporate events (such as LBOs or IPOs);

it compares the situation before and after the financial crisis of 2007/2009 and the improvement of the new Basel Agreements.

We tested whether, before and after the years 2007/2009, there had been or not a significant change firstly in the relationship between ownership structure and banks performance and secondly between ownership structure and efficiency. We consider the years from 2007 to 2009 as breaking point for two reasons:

The well-known global financial crises that deeply affected financial markets and particularly financial institutions and banks.

No later than January the 1st 2008, all EU banks had to adopt and follow the new set of rules defined as “Basel II”, issued by the Basel Committee and organized on three “pillars”.

RESEARCH QUESTIONS

The aim of this study is to compare private and public Eurozone banks, before and after the financial crisis of 2007/2008, under two specific performance dimensions: profitability and efficiency.

According to the existing and analyzed literature, a privately held company would tend to be more profitable and more efficient than a publicly traded company. This is mainly due, according to the agency theory, to the higher level of separation of ownership and control in publicly traded firms. Some studies suggested that publicly held banks have a “composite” and more articulated objective function and this may affect significantly their performance, because, even if there is a strong majority shareholder, it may be difficult (or very expensive) to control executives with multiple institutional objectives.

Our research questions are:

RQ1: are publicly traded Banks of the Eurozone significantly less profitable and less efficient than similar privately held banks?

RQ2: have significant changes taken place before and after the crisis of 2007, regarding the RQ1?

METHODOLOGY

In order to validate the research questions, we used traditional accounting variables to measure banks performances (according to Oyewo Babajide and Babatolu Ayorinde, 67% of UK Banking industry use Financial variables as measure of performance). More specifically, we used Return on Assets (ROA) to measure profitability. ROA is defined as the ration between net income (after tax) and end-of-the-year total assets. Existing literature frequently analyzed efficiency under two different perspectives: “technical” efficiency and “allocative” efficiency. In our study operating efficiency is measured, according mainly to the first perspective, using the ‘non interest cost to income ratio’ (CtoI). This ratio consider the bank’s overhead as a percentage of its revenue. Banks’ costs include salaries, rent and other general and administrative expenses. We excluded interest expenses, considered mainly investing decisions that do not depend strictly on operational efficiency. This ratio is a quick and easy way to express the bank's ability to turn resources into revenue. Obviously, the lower the ratio, the better it is. An increase in this efficiency ratio may show either an increase in costs or a decrease in revenues.

The research method is a statistical multi-regression analysis to test whether public or private ownership has a significant effect on the bank performance. This analysis was conducted with performance variables (testing for profitability and efficiency) as dependent variables and bank characteristics (among which we also considered publicly vs. privately held ownership) as independent variables. For this purpose, we used the following equation:

$$Y_{i,t} = \beta_0 + \beta_1 \cdot X_{i,t} + \beta_2 \cdot C_t + \beta_3 \cdot Z_{i,t} + \beta_4 \cdot PUB_i + \varepsilon_t$$

where:

$Y_{i,t}$ is the vector of the dependent variable (ROA, CtoI respectively)

$X_{i,t}$ is a vector of banks characteristics (dimension, type of bank,...)

C_t is a vector of variables that controls for location effects

$Z_{i,t}$ is a vector of time-effect variables that control for macroeconomic effects

PUB_i is a dummy variable (1 for publicly traded banks, 0 for privately held)

ε_t is the vector in terms of error.

The vector $X_{i,t}$ controls banks characteristics (total assets, total equity, total cost to total assets, cost to income, funding mix, etc...) that may affect the performance, in order to define more clearly if the ownership structure (public vs. private) has an effect on the banks performance. With (log of) total assets (banks size) we control for scale effects, as public banks tend to be larger than privately held ones. With the ratio of equity to total assets we control for leverage effects. Furthermore, we control location effects with the vector C_t , that defines where the bank is located (i.e. in which Country). The vector $Z_{i,t}$ comprises quite a large number of the most common macroeconomic variables. For the ownership, we distinguish between privately held and publicly traded banks by whether the bank is listed or not (i.e. it issues publicly traded stocks). According to these criteria, we labeled as “listed banks” those whose shares are traded on a main stock exchange in a Country. Finally, we assume that the variable $Y_{i,t}$ is influenced by a stochastic error ε_t with the following notes of assumption:

- 1) $E(\varepsilon_t) = 0$ $\forall t$
- 2) $E(\varepsilon_t \varepsilon_s) = 0$, $\forall t \neq s$ (absence of correlation)
- 3) $E(\varepsilon_t^2) = \sigma^2$, $\forall t$ (constancy of the variance)

Data and Sample

Our sample consists of 3,760 banks from all the 18 Country of the Eurozone. Country origin of the sample is reported in table 2. The primary data source is the latest version of Bankscope (Bureau Van Dijk), that provides a wide set of information and detailed financial statements of over 30,000 banks in the globe. For the EU the comparison of financial statements of both private and public banks is made possible largely because European laws require both public and private banks to report the same financial statements. The data are collected from each national official public supervisor in charge of collecting the annual accounts coming from the officially filed and audited accounts. We collected additional data from official websites of banks, financial institution, ECB, Eurostat, EBA, European Banking Federation and local Central Banks. Some data has also been collected from banks official websites.

RESULTS AND DISCUSSION

In order to analyze profitability, we used ROA in the regression equation, while for the analysis of efficiency, the dependent variable was the previously described ‘non interest cost to income ratio’ (CtoI). The results of the regression analysis are reported in the following table 5-6-7-8. We repeated each regression analysis twice: one with 2013 data and another with 2005 values, in order to check if there has been a break-even among these two periods.

Table 5 and 6 report the results of the multiple regression of ROA for 2013 (table 5) and 2005 (table 6), testing for the effect of the ownership on profitability. Both regressions present an R^2 around 16%, which represent the fraction of the variation in the dependent variable that can be explained by the regression. The F-test of the analysis of variance (ANOVA) shows that at least one of the parameter is linearly related to the response variable.

We find that the coefficient of the PUB variable is significant and is NEGATIVE for both the years. This means that we can state, according to the RQs, that publicly traded Banks of the Eurozone are significantly less profitable than similar privately held banks, both before and after the financial crisis of 2007/2008. All the other independent and control variable are also significant (at 95% confidence), with the exception of the variable Z (macroeconomic effects), but only for 2013. These may suggest that the basic traditional macroeconomic variables considered in the regression (i.e. GDP per person, inflation, unemployment, interest rates), after the crisis may be no longer able to explain significantly the dependent variable (banks profitability) changes.

Table 7 and 8 report the results of the multiple regression of non interest cost to income ratio for 2013 (table 7) and 2005 (table 8), testing for the effect of the ownership on operating **efficiency**. The regression for 2013 reports an R² around 14%, while for 2005 it increases to 16%. The F-test of the analysis of variance (ANOVA) shows in both the regressions that at least one of the parameter is linearly related to the dependent variable. We find that the coefficient of the PUB variable is significant and is POSITIVE for both the periods taken into account. This findings suggest, according to the RQs, that publicly traded Banks of the Eurozone are significantly less efficient than similar privately held banks, both before and after the financial crisis of 2007/2008, as publicly traded banks presents higher operative costs than privately held ones. All the other independent and control variable are also significant (at 95% confidence), with the exception of the variable Z (macroeconomic effects) for both 2013 and 2005.

SUMMARY AND CONCLUDING COMMENTS

In this paper we analyzed whether publicly owned banks in the Eurozone are less profitable and less efficient than privately held ones. According to the Agency Theory and some literature and previous studies on industrial firms we expected lower performance results in publicly held banks. According to our analysis we find quite strong evidence supporting our hypothesis and the existing literature. This relationship seems not to have changed before and after the financial and economic crisis that started in 2007 in the US. Also the new stricter rules (for example Basel Agreements) and the far more pressuring and alert activity of the regulator authorities (for example the “stress test simulations”) seem not to have changed the relationship significantly. Anyway, the significance of the control variable for location effects may suggest that, even inside the Eurozone after more than 15 years of common monetary policy under the activity of the same Central Bank, there are still significant differences in the banking activity from Country to Country. Further development of this model may be applied at the risk-taking attitude of banks. Another possible development may led to considering non only the Eurozone, but the entire 27-EU Countries.

THE DETERMINANTS OF VENTURE CAPITAL FINANCING: EVIDENCED FROM PAKISTAN VENTURE CAPITAL MARKET

Imamuddin Khoso, University of Sindh

Imram Shaikh, University of Sindh

Aisha Memon, University of Sindh

ABSTRACT

This paper empirically examines the determinants of demand for venture capital financing in Pakistan over the period 1992 to 2008. The critical determinants in accordance to their importance are found to be interest rate, the level of stock market development measured by market capitalization to percent of GDP and real GDP growth. In the interaction model of regression, it is found that the positive impact of GDP growth on venture capital demand is reduced in the periods of lowering economic freedom index. The rising index of economic freedom increases significantly the aggregate impact of GDP on demand for venture capital. The most surprising result of this study is that IPO is negatively correlated with the demand for venture capital even though the opposite was hypothesized. The OLS method was applied to test the hypothesis.

KEYWORDS: Venture Capital, Financial Market and Development Economies

INTRODUCTION

The research studies show that venture capital-backed firms outperform their non-ventured counterparts in number of categories like employment growth, sales growth, wages growth, export growth, and R&D expenditure growth. According to (Global Insight: Venture impact 2004) in USA during the period of 2000 to 2003: 'the employment in venture-backed companies grew by 6.5 percent while National private sector employment dropped by 2.3 percent. Venture-backed company sales increased by 11.6 percent, while overall rise in US company sales increased by 2.5 percent'. Moreover, in Europe from 2000 through 2004, the private equity and venture capital financed companies created new jobs at an average rate of 5.4 percent annually. This is eight times the annual growth rate of total employment (i.e. 0.7 percent) in the EU-25 during the same period (EVCA 2005). Furthermore, US venture-backed firms adjusted for size, spend twice as much on R&D as non-ventured backed firms (Global Insight 2004) while in Europe the average R&D expenditure by employee in venture-backed companies is six times higher than the R&D expenditure per employee of the 500 largest companies in the EU-25 (EVCA 2005). In Australia for the period 1993-1996, the employment and sales of venture-backed firms increased by 20 percent and 42 percent respectively compared to 2 percent and 6 percent respectively by the top 100 Australian companies (Coopers and Lybrand Corporate Finance, 1997). Besides, the venture capital has also played a major role in stimulating technological innovation in many of Asian Economies. For example in Singapore, the venture capital is seen as the bridge between the technologies of the USA and Europe and technology transfer to Singapore (Dennis M.Ray 1991). The technological innovation and the growth of venture capital markets are closely interrelated in case of Taiwan (Premus, 1985). The Korean Government has been supporting venture capital firms since 1980s in one of its efforts to develop high technology industries (Joongdoung Rah et al, 1994). The rapid growth also characterizes venture-backed firms in Japan (Suzuki, 1996).

Therefore, in view of ever-increasing importance of venture capital especially for developing this paper focuses on the Pakistan venture capital market and empirically examines the determinants of the demand

for venture capital financing in Pakistan over the period 1992 to 2008. In Pakistan according to SECP (Security Exchange Commission of Pakistan) the venture capital is defined under the venture capital companies and funds rules 2001 as ‘A company which is engaged in financing any venture project, through equity or other investments weather convertible into equity or not and provides managerial or technical expertise to venture projects or acts as a management company for management of venture capital funds’.

There are different vehicles that provide risk capital. The Andrea (2003) has classified the risk capital into formal and informal sources. The professional investors such as business angels (BA) form informal risk capital market, where as institutional investors such as venture capital firms represent formal risk capital market. In Pakistan, under the current regulation of SECP (Security Exchange Commission of Pakistan), it seems that a firm intending to supply risk capital will be required to apply for a license as either a venture capital company or venture capital fund. Therefore, in the next session I focus at venture capital companies of Pakistan as a formal risk capital market and empirically examine the determinants of demand for venture capital financing.

THE DETERMINANTS OF VENTURE CAPITAL DEMAND

The objective of this study is to identify and understand the determinants of venture capital demand in Pakistan. The demand in this case is defined as the entrepreneurs’ willingness to get venture capital financing for their firms and that can provide a desired level of rate of return. Several previous studies have empirically examined the determinants of venture capital from Supply-side as well Demand-side. Jeng and Wells (2000) analyze the determinants of venture capital for a panel data of 21 countries over the period of 1986 to 1995. The analysis of (Douglas, et al, 2002) focuses on the determinants of venture capital investing in Canada in data series from 1977 to 1999. (Andrea, 2003) identifies the driving forces of venture capital activity for a panel data set of 14 European countries over the period 1988 to 2000. (Astrid Romain et al, 2004) develop a theoretical model to define the determinants of venture capital for a panel data set of 16 OECD countries for the period 1990-2000. (Gompers and Lerner, 1998) examine the determinants of venture capital fundraising in the USA over the period 1972-1994. Below, I briefly discuss the potential determinants and their possible impact on the demand for venture capital in Pakistan.

Initial Public Offering (IPO)

The cycle of venture capital investment works well in an environment that offers a better channel of exit. There are many potential ways to exit a venture capital investment such as IPO, Trade Sale and Management Buyout etc. However, the literature shows that an active IPO market is an important determinant to the existence of a well-developed venture capital industry (Black and Gilson 1998). In the exit strategies, VCs and Entrepreneurs consider an IPO as the ideal exit (Wall and Simth, 1997). This motivation of going IPO could be examined in the light of academic theory, and the benefits of all the parties involved i.e. VCs, Entrepreneurs and Suppliers of venture capital. First academic theory suggests that going public reduces the cost of capital (Scott, 1976) and optimizes the capital structure (Modigliani and Miller, 1963) and thus may favor IPO to other exit options. Secondly, for venture capitalists taking the firm to IPO brings a handsome return. That high return, is then passed to investors (i.e. suppliers of venture capital) in order to compensate them for their taking of high risk. According to study conducted by venture economics (1988), a US \$1 investment in a firm that goes public provides an average cash return of US \$1.95 over the original investment for an average holding period of 4.2-year. Meanwhile a US \$1 investment in an acquired firm yields a cash return of only 40 cents over an average holding period of 3.7-year. In addition of this highly rewarding potential return, VCs also view an IPO as a strategic reputation-enhancing move. This move, if successful builds VCs reputation that helps them to raise the additional financing from investors. Finally as also argued by (Black and Gilson, 1998, Jeng and Wells, 2000) that IPO gives the entrepreneurs a call option to regain decision-making control of the firm since VCs give up controlling rights at the time of IPO.

Therefore, I focus at IPO as a preferable route to exit and expect a positive relation to the demand for venture capital. Hence my first hypothesis is:

Hypothesis #1: The rising volume of IPO will have a positive impact on the demand for venture capital financing.

Stock Market Development

A well developed and an efficient financial environment is needed to drive the growth of venture capital industry. Black and Gilson (1998) found a linkage between country's development of financial system and venture capital market. I use the ratio of stock market capitalization to GDP as an indicator of the development of stock market. This ratio shows a share of national output and therefore should positively reflect the liquidity on an economy-wide basis. The authors like Franklin Allen, et al, (2002) argue that the development of stock market (i.e. the market capitalization as a percentage of GDP) may indicate the country's future economic outlook and development of its financial structure and thus may determine the investment opportunities to Venture Capitalists. Therefore:

Hypothesis #2: The growing size of Stock Market capitalization to GDP will have a positive impact on the demand for venture capital financing.

Real GDP Growth

It is well documented that fluctuations in economic growth affect the general level of investment in an economy. Macroeconomic growth positively affects the start-ups of new firms (Audretsch and Acs 1994) and also improves the opportunities to grow for existing SMEs. The increase in activities in new start-ups and growth SMEs, in turn could enhance the demand for venture capital. Therefore, a positive relationship is expected between economic growth (as measured by real GDP growth) and the demand for venture capital. Hence:

Hypothesis #3: The real GDP growth will have a positive impact on the demand for venture capital financing.

R&D Expenditure

Technological opportunities stimulate the venture capital activities (Hellman and Puri, 2000). It is evident from the literature that a key determinant of technological opportunities is knowledge accumulation through expenditure on R&D. The study of (Sean M., et al, 2003) interpreted R&D expenditure as a measure of innovativeness since it measures a nation's sacrifice to resources to achieve future technological change. More recently (Acs and Audretsch, 2005) have suggested the comprehensive ways to measure the technological change of a country. One of such ways is to measure the inputs into the innovation process such as R&D expenditure. Gompers and Lerner, (1998) and Macro Da Rin et al, (2005) have acknowledged the role of R&D in creating innovation that led the development of US venture capital industry at aggregate level. Therefore, I expect that growth in R&D expenditure could spur the innovative activities and thus increase the demand for venture capital to capitalize on those innovative activities. Hence:

Hypothesis #4: The growth in R&D expenditure will have a positive impact on the demand for venture capital financing.

Short-term Interest Rate i.e. One-year

Venture Capital is more than money since it provides value-added services to the investee. However, in Europe the entrepreneurial companies look at venture capital as a primary source of financial survival because they cannot find alternative sources of financing (EVCA, 2002) suggesting credit support as a

major benefit of venture capital (Marco, et al 2005). This situation could be more serious in understanding the role of venture capital market in transition economies like Pakistan. Therefore, the level of the cost of alternative sources of financing such as bank loan could well affect the demand for venture capital.

The findings of (Bygrave et al, 1992, Gompers and Lerner 1998, Douglas J.Cumming et al 2002, Astrid Romain et al 2004) suggest that the short-term interest rate has a positive impact on the demand for venture capital. This could be explained that rising interest rate may make the traditional source of financing more expensive. In such an environment, it is more likely that entrepreneurs prefer to meet their external financing needs with venture capital. Supply of and demand for venture capitals respond differently to rising interest rates and therefore it is difficult to expect the net impact of interest rate on venture capital activity. Hancock and Wilcox (1998, p.988) write ‘...because the interest rate would likely convey information to banks and borrowers not just about the cost of credit but also the expected future returns and risks of credit, it is not straight forward to interpret the coefficient on the interest rate variable’.

This situation occurs especially when one analyzes the equation representing the linear function for the supply and demand of venture capital where interest rate coefficient measures equilibrium specification. In that case the impact of interest rate is either negative or positive depending on the demand price effect and supply price effect (Astrid Romain et al 2004). However, in this study my focus is only on the demand equation of venture capital. Therefore, from entrepreneur’s demand perspective, it is reasonable to expect a positive relationship between interest rate and demand for venture capital. Hence:

Hypothesis #5: The rising short-term interest rate (i.e. one-year) will have a positive impact on the demand for venture capital financing.

Government Tax Relief

There has been a debate on the role, the government can play in the development of venture capital industry (For details see: Sophei Manigart et al 2001, Marco Da Rin et al 2005). The government can spur the activities of venture capital market by directly investing into it or indirectly encouraging the industry for example by making the legal and tax environment favorable. Through worldwide, among the government measures taken in that direction, the reduction in tax rate especially on capital gain seems to be an effective one. Since reduction in capital gain tax is found to have a positive impact on the demand for venture capital (Perez 1986, Poterba 1989, Gompers and Lerner 1998). This may be because an environment with lower capital gain tax rate encourages the entrepreneurs to start their own firms, as they can own the greater portion of their earnings. Some of the government tax relief policies that influenced the venture capital activities are: In USA in 1993, the capital gain tax was reduced from 28% to 14% on investment in small companies held for five years (Gompers and Lerner 1998). Capital gain taxation has been brought lower in several countries of Europe (EVCA, 2003). Among them, UK government initiated venture capital trust (VCT) to provide income tax and capital gain tax relief in year 1995 (Bank of England, 1996), in 1986 the Portuguese government exempted the venture capital corporation from income tax and other taxes during the year of its incorporation and the three following years (EVCA, 1986). In Asia, in 1993 the Government of Singapore (under the section 13 H incentive for venture capital funds) granted a tax relief of up to 10 years (EDB, 1997). The government of Pakistan also took the similar step and (under clause 102G of part of second schedule of income tax ordinance) exempted the profits and gains arising out of venture capital funds from income tax effective from July 1st, 2000. I examine the impact of this policy incentive by using a dummy variable in my regression analysis where it is presented with value of ‘0’ from FY1992 to FY2000 and value of ‘1’ from FY2001 to FY2008. The impact of this policy incentive is expected to be positive. Therefore:

Hypothesis #6: The government tax relief (under the clause 102G of part of second schedule of income tax ordinance) will have a positive impact on the demand for venture capital financing.

The Economic Freedom at aggregate level

The literature shows that a set of elements that make up an aggregate environment could influence venture capital activities across the countries. For example conducive fiscal, legal and regulatory environment (Holger R., 2005) tax and currency exchange environment (Rafiq Dossani, 2003) and most importantly the investor protection and enforcement of contracts and rule of law (Franklin Allen et al, 2002) are found to have influenced the level of venture capital activities across the countries.

Furthermore, the opening of markets and the ability to trade with the world's largest economies is critical for the success of venture capital in any country. These notions contend that the conducive environment in terms of the factors mentioned above, can be an important determinant in defining the level of venture capital activity. Therefore I have made the use of index of economic freedom (EFI) published by the Economic Freedom of the World Network that measures the degree of economic freedom in a country. The important elements captured by the index are reliance on markets, availability of sound money, legal protection of property rights and enforcement of contracts, rule of law, access to judiciary, free trade and market allocation of capital. The rating is based on a zero to ten scale, with ten being the most free and zero the least. In other words, the higher score of index of economic freedom would be indication of an environment that has the greater protection of investor and investee rights, prevalence of rule of law, fair access to judiciary and trade openness, among other factors. Such an environment would create more room for the investment to take place in general. Therefore, it is assumed that rising index of economic freedom will be having a positive impact on demand for venture capital. In application of index value in my regression analysis, I follow the approach of (Astrid Romain et al, 2004) and introduce it in interaction with GDP growth. That is the impact of real GDP growth on the demand for venture capital is composed of fixed component ($\beta_{GDPg\ t-1}$) and a component that depends upon the level of (EFI) over the years i.e. $\beta_{GDPg\ t-1}$

$$t-1 = \beta_c \text{ GDPg } t-1 + \beta \text{ EFI}_i * \text{GDPg } t-1$$

In other way, I argue that rising index of economic freedom would increase the aggregate impact of GDP on demand for venture capital and vice versa. Therefore:

Hypothesis #7: The rising index of economic freedom (in interaction with GDP growth) will have a positive impact on demand for venture capital financing.

MODEL FOR VENTURE CAPITAL DEMAND

$$VCD_t = \alpha + \beta X_{it} + \delta D_t + \varepsilon_t$$

Where:

VCD_t = Venture Capital demand for (t) year.

X_{it} = The variables (i=1, 2, 3...) that affect venture capital demand in (t) period.

D_t = refers to dummy variable to capture the effect of Government tax relief.

ε_t = an error term.

Model 1:

$$VCD_t = \beta_0 + \beta_1 \text{ IPO}_{t-1} + \beta_2 \text{ MKT}_{\text{GDP } t-1} + \beta_3 \text{ GDPg}_{t-1} + \beta_4 \text{ RDg}_{t-1} + \beta_5 \text{ Ir}_t + \beta_6 \text{ GT}_t + \varepsilon_t$$

Model 2: (Without dummy variable)

$$VCD_t = \beta_0 + \beta_1 IPO_{t-1} + \beta_2 MKT_{GDP\ t-1} + \beta_3 GDPg_{t-1} + \beta_4 RDg_{t-1} + \beta_5 Ir_t + \varepsilon_t$$

Model 3: (With interaction)

$$VCD_t = \beta_1 IPO_{t-1} + \beta_2 MKT_{GDP\ t-1} + \beta_3 GDPg_{t-1} + \beta_4 RDg_{t-1} + \beta_5 GT_t + \beta_6 EFI (GDPg_{t-1} * EFI_t) + \varepsilon_t$$

Where:

IPO = The amount raised through Initial Public Offering at Karachi Stock Exchange (KSE). The data is taken from KSE official website.

MKT_{GDP} = Total Market Capitalization of (KSE) as percent of GDP. The data is taken from Pakistan Economic Survey various issues.

GDPg = Real GDP growth. The data is taken from Pakistan Economic Survey various issues.

RDg = Growth rate in Research and Development Expenditure (R&D). The data is taken from Pakistan Economic Survey various issues.

Ir_t = Annual weighted average lending rate of all commercial banks in Pakistan based on stock data. The data is taken from State Bank of Pakistan.

EFI = Economic Freedom Index, which is shown in interaction with real GDP growth. The data is taken from The Heritage Foundation various issues.

GTt = Government tax relief to venture capital investment. It is a dummy variable.

ANALYSIS OF REGRESSION RESULTS

The results of multivariate OLS regression fully support the hypotheses 2, 3, 5, 6 and 7 while hypotheses 1 and 4 are not supported. The most surprising result of this study is that IPO has a negative impact on the demand for venture capital, even though the opposite was predicted. However, there are a few studies like Gompers and Lerner (1998) who could not empirically find the significance of IPO in affecting venture capital activity in USA. I could offer two reasons for this outlier result. First that VCs and entrepreneurs have strong motivation for going public. Therefore, it is likely that venture-backed firms may be brought to IPO prematurely, which sometimes is referred as Grandstanding. Having said that one could consider the scenario generally discussed among analysts that is, 'a venture-backed firm, in expansion or mezzanine stage that needs more equity, may consider a pre-mature IPO, thus pushing forward the IPO date rather having another round of financing from Venture Capitalists. If many firms opt to this scenario, the demand for venture capital would actually fall'. However, I could not accept this reason because to my knowledge there have not been any significant number of venture-backed IPOs in Pakistan during the time series under analysis that actually could have caused the fall of venture capital demand. Secondly, in models 1, 2 and 3 (which show the negative impact of IPO at significant level) the value of adjusted R-squared is 0.699, 0.625 and 0.794 respectively indicating that some portion of variation is left unexplained because of factors not considered in the analysis such as trade sale or Management buyout etc, the alternatives to IPO. The omission of these potential factors due to non-availability of data might have influenced the coefficient of IPO. Despite these reasons, I still believe that further research is needed on this relationship. The impact of stock market development on venture investment is significantly evident. However, the capital market in Pakistan still lags behind the level of development which many other regional country markets (like India, china, Singapore and South Korea) have attained. In Pakistan, the ratio of Market capitalization to GDP ranges from 8.03% to 21.50% with mean value of 12.47% in my data series, which is much lower than generally accepted benchmark of 100%. Stock Market in Pakistan has so far played very limited role in providing an exit mechanism via IPO or OTC to the venture capital investment. In such a case, the preferential way to exit venture investment seems to be trade sale rather than IPO. This could be the phenomenon of developing economies as the limited use of IPO as an exit route is also empirically evidenced in some studies focused at transition economies (Karsai 1999, Szerb L. 2004, David Ahlstrom et al 2006). Therefore, in future research, the alternative exits such as trade sale should necessarily be

incorporated in examining venture capital activity in developing economies. Furthermore, interest rate is found to be one of the most significant and important determinant to venture capital demand. It reinforces the view that in Pakistan venture capital is used more as meeting financing needs than as value-added counseling needs and thus it underscores the need to highlight the importance of venture capital as a potential source of strategic and value-added service provider among the entrepreneurial community in Pakistan. The positive impact of government tax-exemption is evidenced. The total assets of all venture capital companies in Pakistan have grown at an annual compound growth rate of 56% from FY2001 to FY2008 as compared to government pre-tax relief period where total asset based increased at an annual compound rate of 36% from FY1992 to FY2000. The interaction term in model 3, yields highly significant and meaningful coefficient indicating that the aggregate impact of GDP on the demand for venture capital increases as the level of economic freedom of country rises. The (figure 1) shows the aggregate impact of GDP on the demand for venture capital at all the levels of the index of economic freedom.

Table: Regression Estimates: Dependent Variable: Log of total annual venture capital assets. Sample: FY1992 to FY2008.

CONCLUDING REMARKS

The presence of an active venture capital industry in transition economies is necessary for promoting economic, technological and entrepreneurship growth. This paper empirically examines the determinants of demand for venture capital financing in Pakistan over the period 1992 to 2008. The critical determinants in accordance to their importance are found to be interest rate, the level of stock market development measured by market capitalization as percent of GDP and real GDP growth. In the interaction model of regression, it is found that the positive impact of GDP growth on venture capital demand is reduced in the

periods of lowering economic freedom index. The rising index of economic freedom increases significantly the aggregate impact of GDP on demand for venture capital. Surprisingly, contrary to expectation, the IPO is negatively correlated with the demand for venture capital.

In precise, the most important contribution of this paper is that in addition of degree of financial market development and GDP growth, the level of economic freedom (as measured by index of economic freedom EFI) has significantly greater impact on venture capital activity in developing economies and that venture capital market to flourish in developing economies requires certain level of technological opportunity (Astrid R. et al, 2004) the economic freedom as indicated by EFI. Finally, it is hoped that this study would provide a fertile ground for future research in this emerging Pakistan venture capital industry.

ABSTRACT

Mobile Money Transfers between individual telecom users has seen incredible growth in Emerging Markets. With greater attention and infrastructural support from telecom operators and limited regulatory requirements from Governments, Mobile Money is poised for accelerated growth and innovative disruption, with positive expected developmental effects for consumers. Through literature review of related academic articles, company publications and disclosures and institutional practitioner reports, this study will assess the success factors behind expansion of two highly successful mobile money providers: M-Pesa in Kenya and bKash in Bangladesh. Based on the assessment and comparative review of performance, the study will also posit a framework of critical success factors needed for replicable growth of new similar mobile money operators in other emerging markets.

KEYWORDS: Mobile Money, Mobile Payment, Emerging Markets, Developing Countries, Bangladesh, South Asia, Kenya, Sub Saharan Africa, Financial Inclusion, Financial Innovation.

INTRODUCTION

Mobile Money for this article refers specifically to mobile phone based platforms for money transfer between individual mobile subscribers. In recent years, mobile money adoption and usage has seen tremendous growth in developing and emerging markets, especially among the traditionally lower income unbanked populations (Holmes, 2011). The underlying technology enabling the growth of mobile money in developing economies has long existed in more developed economies, where the technology has been primarily used by financial institutions as a tool to generate competitive advantage in targeting convenience seeking affluent consumers.

Since 2005, the same technology is being used in developing countries to make basic financial services available to a wider spectrum of customer segments within Developing country markets. This phenomenon is best exemplified by the tremendous growth and success of *m-Pesa* in Kenya and *bKash* in Bangladesh. The successes of both companies have the potential to yield substantial economic and social benefits for the unbanked in these emerging markets (Porteous, 2006; Weber & Darbellay, 2010)

The objective of this paper is to identify success factors that led to the successful growth and capturing of dominant market share by these exemplar mobile money companies and provide a framework of critical success factors for growth of mobile money operators in other emerging markets. It is important to note however that the successful exemplar companies studied in this effort operated within their own unique

mix of market, regulatory and social factors and had their own unique managerial challenges, experiences and capabilities. This paper neither argues for perfect replication of decisions made by these two companies as a gateway for success nor suggests that a specific mix of conditions are prerequisites to success in other emerging markets. It simply notes the factors that contributed to their success as a useful starting point for practical consideration.

Expanding the use of Mobile Money in other developing or emerging markets has two primary benefits. Firstly, use of mobile money through an ever increasing base of mobile phone users provides a platform that can be leveraged to service the financial needs of the poor (Ivatury & Mas, 2008; Morawczynski, 2009). Given the severely limited reach of banking infrastructure in the developing world, reaching wider number of customers faster and cheaper would reduce cost of delivery of basic financial services, which would help bring greater proportion of the unbanked into the formal economy. Secondly, successful mobile money has the ability to enable and catalyze the development of progressively complex and value adding mobile commerce particularly in the developing world.

LITERATURE REVIEW

Financial Inclusion

Financial Inclusion (FI) is a process which ensures access to appropriate financial products and services which are available at affordable cost to the low income and underprivileged members of the society. This has become an integral part of development policy in many developing countries (Duncombe & Boateng, 2009). FI means to reach out to the demographic which are under-banked populous of a country, and provide them with adequate, affordable and timely financial services such as accounts, credit, and insurance services (EY, 2009). On the other side of the coin there's a concept of Financial Exclusion (FE), which is a result of lacking infrastructural capabilities. To address FE and improve FI in a developing country various approaches and frameworks have been put in place throughout the globe, these include: Microfinance initiatives, policies that require commercial banks to set up a rural branch for a particular number of regular branches, and most recently is the use of Information Communication Technology (ICT) to address issues of affordability and prompt financial service delivery (Anyasi & Otubu, 2009). Innovations in ICT have evolved from ATMs, online banking, e-commerce. In a developing country the transaction costs are marginal compared to say USA, where withdrawal costs vary from \$1.00 to \$3.00. Yet many people belonging to a poor demographic still cannot afford to open bank accounts and are financially excluded (EY, 2009). This promotes insecure cash based economies, exploitative financial opportunists, and loan sharks. It is desired by many people in such an economy to have access to financial services, which in tandem helps reducing poverty. An interesting innovation to emerge after microfinance was the use of mobile phones to access basic financial services, primarily money transfer between individuals via a specialized platform. This service was widely used across different income demographics including those at the Base of the Pyramid (BOP) and thus the concept of Mobile Banking in the context of Emerging Markets was born (Anyasi & Otubu, 2009).

Mobile Commerce or Mobile Banking

The primary actors in the mobile payment services market are mobile payment service providers and their customers. Different stakeholders that play a role in the market include financial institutions, telecom operators and retail merchants who act as the point of sale persons converting cash to virtual cash credits. Other actors in this business typically include vendors of hand-sets, software, networks and other technologies. The power and the interests of these parties impact how technologies and other resources are incorporated into mobile payment services, and importantly how these services are used and offered by the market. Furthermore, mobile payment services compete for the consideration of customers and other parties in competition to physical and electronic payment services. In order to succeed, mobile payment services

have to flexible and offer added value, and be available for other relevant payment environments as well (EY, 2009).

Ivatury and Mas (2008) in their article have argued the how branchless banking can dramatically reduce the cost of delivering financial services to the poor. In the article the author argues that most mobile banking projects are marketed by telecom operators, and are responsible for the outreach of such a program. Concerns are also mentioned regarding quantifying practical risk on the basis of knowing your customer, since mobile banking cannot fully substitute for a human touch.

The poor demographic are a bankable proposition that enable commercial banks to work with economies of scale, using mobile banking regulation one can offer low cost deposits that enable less risky liquidity management than bulk deposits, credit risk and inoperability risk (Astha, 2010). Mobile banking provides opportunities for innovation in the development of products targeted for the poor market segment, yet regulations would help reduce risk levels and allow this particular industry to grow, however the regulations should not minimize the benefits of mobile banking (Astha, 2010).

Malhotra (2011) and Scornavacca and Hoehle (2006) in their research identify how mobile banking operates in developed countries like New Zealand and Germany. They argue mobile banking's utility, cost, security, confidentiality, transaction integrity, knowledge of procedures, are factors that affect success of mobile banking. They've concluded an extremely successful impact of mobile banking on economies of the two countries, and collaboration offered by banks and other financial institutions. The technologies powering this new trend in digital payment are mobile apps and Near Field Communication (NFC). The NFC allows short range communication using magnetic field induction of a RFID (Radio Frequency Identification) of the devices. In Switzerland and some other EU (European Union) economies, mobile payment using NFC has been tested since 2007 and has worked well for these developed countries (Ondrus & Pigneur, 2007). However such advanced technologies being utilized in developed markets are not yet commercially viable to implement in emerging markets due primarily to cost considerations.

It is important to understand important terms and models in mobile banking. Generally mobile money is used to refer to financial activities that are conducted via the mobile phone or other mobile devices. Authors such as Porteous (2006), Weber and Darbellay (2010) have sub classified mobile money into mobile banking (m-banking) and mobile payment (m-payment). The International Finance Corporation (IFC) is a World Bank Group that also defines mobile money as money that can be accessed and used via mobile phone (Jenkins, 2008). The two types of mobile commerce models, m-payment and m-banking, are additive and transformative models. The additive model allows bank account holders to access their accounts, check account balances, transfer funds between accounts or perform other various banking tasks using their mobile phones. On the other hand, the transformative model, the topic of this research, allows unbanked populous to access financial services provided by Mobile Network Operators (MNOs), Micro Finance institutions, and non-bank agencies (Dias & McKee, 2010). As explained before, majority of the rural and poor population in the developing countries does not have the luxury to own bank accounts. Sub-Saharan African countries have one of the biggest unbanked populations in the world, in some cases 80% (Weber & Darbellay, 2010). On the other hand, a large proportion of this populace does have access to basic mobile phones. This provides substantial claim that transformative mobile commerce models have immense potential for the unbanked in these emerging markets (Porteous, 2006; Weber & Darbellay, 2010).

Mobile Money in Emerging Markets

In recent years mobile money has been introduced in several emerging markets. Holmes (2011) argues that certain schemes have already disappeared and the new ones that are coming in are yet to take root. In recent years, two exemplarily successful companies M-Pesa in Kenya, bKash in Bangladesh can be considered to

have done so. In addition to these two, other companies such as Easy-Paisa in Pakistan and MTN in Uganda have also secured notable success.

In the case of M-Pesa, Safaricom and its parent Mobile network operator (MNO) organization Vodafone started this initiative in March 2007 (Jenkins, 2008). In its first 3.5 years post launch, over 70% of households in Kenya and more importantly over 50% of the poor, unbanked and rural populations used the service (Alexandre, 2010). As of October 2014 and more than seven years post launch, M-Pesa has 12.2 million active customers, and 81,000 agent outlets in Kenya. More than half the adult population now uses M-PESA, and the percentage of adults with access to formal financial services today is at 67% whereas in 2009, just 41% of adults had access (Mckay & Mazer, 2014).

M-Pesa uses the transformative model, such as its customer do not require bank accounts, they can simply turn cash into electronic money by agents or dealers associated with Safaricom. They are provided with instructions on how to make payments on their phones using M-Pesa accounts securely, usually the money transfer is protected by a PIN number, and customer support available at all times. Mas and Ng'weno (December 2010) explain three primary factors for M-Pesa's success; they argue the importance of creating awareness and building trust through effective branding, they emphasize customer retention based on good user experience and extensive expansion through retail channels for easy access to customers for cash in/out services, they focus on customer pricing and commission structure to enable customer's early adoption of the service and willingness to pay for it. Plyler, Haas, and Nagarajan (2010) suggest that M-Pesa affects significant economic outcomes of the community members, the study identifies four major effects, i.e. local economic expansion, transaction security, capital accumulation and increased business environment.

Our other exemplar of success bKash is not owned by a MNO like M-Pesa, but is owned primarily by a for-profit Financial Institution, that is itself owned by an NGO. bKash is a specialized company that started in 2011. BRAC Bank (owned by the BRAC Group which is an NGO providing a variety of social services and is one of the largest NGOs in the world) owns 51 percent of bKash shares. Other investors include Money in Motion LLC, IFC (the private sector arm of the World Bank Group) and the Bill & Melinda Gates Foundation (Chen & Rasmussen, 2014). As bKash is not a mobile network operator (MNO), it did not have an existing customer base to which it added mobile financial services and had to acquire each client on its own. bKash that today handles more than 80% of mobile money transactions. In 30 months since launch, its customer base has grown rapidly to 2 million in 2012 to 11 million by the end of 2013 (Chen & Rasmussen, 2014).

Failures Attributed to Mobile Banking rollout in developed economies

Ondrus, Lyytinen, and Pigneur (2009) try to understand why even after a decade of research and trials, mobile payments have failed to achieve the level of integration desired in every day monetary transactions in Switzerland. They utilize three frameworks proposed by researchers, each or them dealing with a different facet to analyze why this was: The first framework is an economic analysis of mobile payment markets. The second one deals with strategic and environmental drivers for success. The third framework focuses on resources and business drivers that are required to condition mobile payment provisioning. Their analysis showed factors from various perspectives that have impeded the growth of this market, mainly issues of trust, security, technology and cultural issues. Dahlberg, Mallat, Ondrus, and Zmijewska (2008) come to similar conclusions they report the ascendancy of using consumer-driven perspectives and applying business-driven models instead of analysis of socio-cultural factors and comparison between mobile and traditional or other electronic payment services. Also similarly Donner (2007) identifies lack of conceptualization of how mobile phones can interact with existing financial networks, and primary research required to overcome that chasm. He also identifies gaps in research related to social perspectives concerning risk, trust, cultural norms, social ties, and other links such as financial, capital and social measures. While these findings are applicable to lack of widespread use of mobile money in developed

markets, it also provides useful lessons of mistakes not to repeat in designing mechanisms for developing and emerging markets.

DISCUSSION ON CRITICAL SUCCESS FACTORS

Key Takeaways from Past Evaluations

For M-Pesa, work done by researchers of the Financial Services for the Poor program of the Bill and Melinda Gates Foundation suggests these overarching success factors (Mas & Morawczynski, 2009):

Strong branding and simple messaging.

Strong focus on user experience and retail agent management (For simplicity, a number of similar but distinct success factors noted in the original work have been clustered under ‘Strong focus on user experience and retail agent management’. These factors include (in order of appearance): Frequent and consistent monitoring of retail agents, scalable agent distribution structure, Easy customer registration systems, simple and transparent retail pricing, free deposits with no minimum balance requirements, and the ability to send money to non-registered customers.)

Balanced growth between customer and retail agents.

As for the newer exemplar bKash, The Consultative Group to Assist the Poor (CGAP) of the World Bank Group suggests the following three overarching success factors which have been instrumental (Chen, 2014; Chen & Rasmussen, 2014).

A specialized organization built to deliver mobile financial services.

A shared vision for scale among a diverse investor group.

An enabling and flexible regulatory environment.

A limitation of the existing literature is that it overwhelmingly focuses on highlighting operational success factors and generally does not mention or downplays the required prerequisite socioeconomic and regulatory and business factors. The latter factors are also critical for success of mobile money platforms. Based on review of the existing academic literature, practitioner articles and on the experience of the authors as development sector practitioners and firsthand observers of the development impact of mobile money, the following section offers a classification framework of necessary success factors.

Framework of Critical Success Factors for Mobile Money Platforms

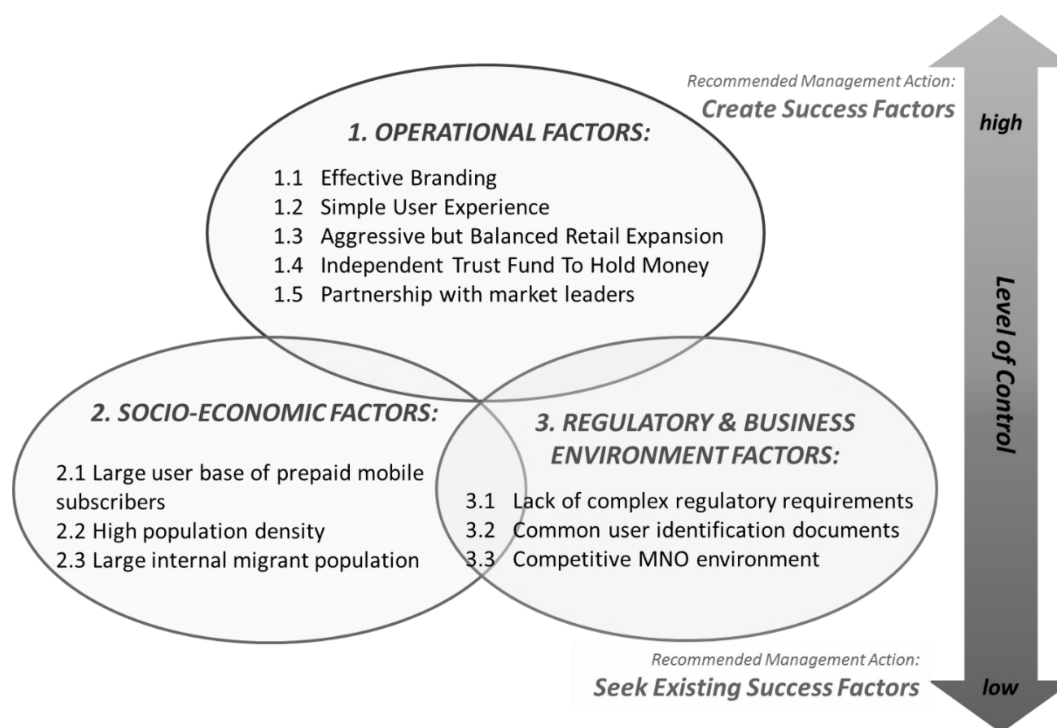

For the purpose of this framework, Success Factors have been classified into three broad categories:

Operational Factors: Linked to operational effectiveness and efficiency. It can be influenced or shaped by managerial focus and appropriate resource allocation.

Socio-Economic Factors: Linked to the attributes of the target market. Limited change or influence possible through managerial focus or resource allocation.

Regulatory and Business Environment Factors: Linked to the competitive environment among MNOs, competitive environment among existing FIs and strength of regulation relating to banking like operations and telecom subsidiaries.

Figure 1: Framework of Critical Success Factors for Mobile Money Platforms in Emerging Markets

Description of Operational Success Factors

Operational Success Factors have received its fair share of focus in existing literature, given that they can be created by management actions.

Effective Branding: Using consistent, intuitive and simply designed promotional materials with aggressive frequency is a common element. Both m-Pesa and BKash have done the following:

Extensively use Above the Line (ATL) communication channels (such as television ads, radio, print, billboard and point of sale ads) extensively to reach a wide audience.

Showcase a simple value proposition such as ‘sending money home to loved ones’ (which both bKash and M-Pesa use).

Both companies *use a distinctive color scheme* (m-Pesa covers all its retail outlets using distinctive green and bKash uses purple with a distinct logo).

Highlight the service as a local innovation (most users in both Kenya and Bangladesh incorrectly believe the service is a local innovation) in order to get favorable local media coverage and free publicity.

Simple User Experience: In order to achieve aggressive growth in markets where significant portions of the population are unfamiliar with financial services and/or uneducated, simplicity and an easy user experience is paramount to success. Both m-Pesa and BKash have done the following:

Design a quick registration process ensures users are typically able to register and send/receive money in under 5 minutes.

Provide payment confirmation by SMS and use 2 step verification (through User PIN codes at point of sale) to ensure adequate security for users.

Use simple retail pricing using flat fees rather than percentage based fees on transfers to ensure customers feel a sense of consistency. No direct fees are typically charged by retail agents, reducing likelihood of extortion or fraud.

Aggressive but Balanced Retail Expansion: Ensuring the right ratio of customers to retail agents is critical to sustainable growth. At the initial stages, a larger number of retail agents relative to customers will be necessary to entice early adopters. But in later stages, retail agents must have sufficient income (by having a sufficiently large pool of customers to serve) from mobile money operations to remain motivated and provide a positive user experience.

Independent Trust to Hold Money: A common query faced by both companies from regulators and the general population (and incidentally by other emerging mobile money operators as well) is whether the platform operator holds the money and what they do with the interest earned. A closely linked concern is whether the money is at risk in the case of default of the platform operator or the parent company.

By ensuring that:

A Trust Fund or separate group of financial institutions holds the money and is responsible for returning to users in the event of operator or parent company default, and

The interest earned is spent for charitable social causes and not counted as revenue mobile money operators can shield themselves from undue scrutiny and negative public exposure.

Partnership with Market Leaders: Early partnership with existing market leaders among both MNOs and FIs is critical to gain easier access to a large user base.

Description of Socio-Economic Success Factors

Without favorable Socio Economic Success Factors, success through creating Operational Success Factors alone is difficult if not impossible. Socio Economic Success Factors are similar to fertile soil for a bountiful harvest- operators should seek out markets with all or most of the below factors and avoid markets with none or few of these factors.

Large user base of Prepaid Mobile Subscribers: Ensures that there is a critical mass of potential prepaid users that can be won over to achieve profitable operations within an acceptable time frame. Prepaid subscribers in emerging markets also happen to routinely visit retail mobile agents given their use of prepaid systems and are more likely to come in related contact with promotion materials. Given that influencing behavior change in favor of adopting mobile money systems among the poor and unbanked is a slow process (Mckay & Mazer, 2014). A wider pool of available prepaid mobile subscribers makes attaining minimum transaction volumes more likely.

High Population Density: Ensures there are a large number of customers for every retail agent employed (which in turn, boosts the agent's profitability and motivation) therefore require employing lower number of agents in a given area. Higher population density also increases cost-effectiveness of any ATL promotional materials, ensuring lower cost of reach per potential customer/user. High population density also leads to greater demonstration effect and word of mouth, where a potential user is convinced to use the mobile money service from watching an existing user.

Large Internal Migrant Population: Country markets with high internal migration rates of labor force have a higher latent demand for mobile money services. As younger workers from rural or semi-urban settings move to urban settings, they leave behind parents and family members who become dependent on regular small sum remittances. As a result, country markets with large internal migrant labor force have the

potential for generating higher volume of transactions, which means higher potential for revenue generation.

Description of Regulatory & Business Environment Factors

Favorable Regulatory & Business Environment Factors are also necessary for successful operations, but are less critical when compared to Socio Economic Success Factors. This is because the adverse effects of an endowment of unfavorable Regulatory & Business Environment Factors can be largely overcome given a favorable mix of the other two factors. Whenever possible, new mobile money platform operator entrants should seek markets with one or more of the below noted success factors:

Lack of Complex Regulatory Requirements: Given Mobile Money's precarious positioning as a subset of both banking operations and mobile network operations, it runs the risk of becoming subject to both types of regulations, usually enforced by two separate regulators which have little coordination. As perfectly demonstrated by the relationship between bKash and the Bangladeshi Banking regulator Bangladesh Bank (Chen, 2014), a friendly regulator that does not burden operators with undue regulations can greatly support growth of mobile money operations. Making the case for less burdensome requirements initially may be easier if the parent company is a significant taxpayer (such as leading MNO operators in oligopolistic markets which tend to be huge VAT and income tax generators for governments) or if investors/sponsors are part of a multilateral development agency that has existing relationships with the government to make the development case for less burdensome regulation.

Common User Identification Documents: Prevalence of government issued uniform identification documents such as birth certificates, voter identification cards, passports and/or national identification cards are extremely valuable for easily processing new users. These documents can also be used for 3 factor verification systems as in the case of m-Pesa which requires the presentation of mobile phone, user PIN and some identification documentation when making payments.

Competitive MNO Environment: Mature telecom markets tend to be oligopolistic in nature, with competition among MNOs to attract new customers, retain existing customers, increase revenue per customer and secure competitive advantage.

If the mobile money platform operator is backed by a financial institution, an existing fiercely competitive MNO environment will allow the operator to play one MNO competitor against another, securing quicker adoption and lower transaction fees, as exemplified by bKash (Chen & Rasmussen, 2014).

If the mobile money platform operator happens to be backed by an MNO in a competitive environment, it will be easier to secure additional resources and management buy-in as management will be more attuned to the need to capture first mover advantage ahead of competitors, as exemplified by m-Pesa (Morawczynski, 2009).

CONCLUSION

Based on this evaluation of the two most successful mobile money platforms in emerging markets to date, the framework of success factors generated is intended to provide a useful management tool to possible new entrants. The framework should be equally applicable to entrants looking to enter markets with no mobile money operators as well as to entrants looking to enter markets with few existing operators. A limitation of this framework is that it does not consider competitive forces, for which it would be useful to utilize alongside the commonly used Porter's Five Forces Framework for a more complete picture.

INFLATION TARGETING AS A POSSIBLE MONETARY FRAMEWORK FOR NIGERIA

Ikechukwu Kelikume, Lagos Business School
Olaniyi Evans, Lagos Business School

ABSTRACT

Volatility in prices is a huge economic challenge, able to engender instability and topple economies. One of the issues facing Nigeria today is the choice among two nominal anchors: exchange rate pegging or inflation targeting. Widely accepted, among central bankers and academics, is the idea that inflation targeting makes a difference with respect to its ability to mitigate the volatility of output and of inflation and cause inflation decline. Consequently, this study examines inflation targeting as a possible monetary framework for Nigeria, using time series data and with the aid of Granger Causality test and impulse response functions. The empirical results show evidence that inflation is highly sensitive to exchange rate and interest rate while economic growth is highly sensitive to exchange rate and inflation in Nigeria. Further, the causation from real exchange rate to economic growth is stronger than the causation from inflation to economic growth, meaning exchange rate determines economic growth in Nigeria more than inflation does. Therefore, inflation targeting will be less preferable to exchange rate targeting in Nigeria as a policy alternative. This unexpected finding has important implications for monetary policy conduct in Nigeria.

KEYWORDS: Inflation Targeting, Monetary Policy, Inflation

INTRODUCTION

Inflation targeting, as an economic policy, is an attempt to steer inflation towards a projected, or "target", inflation rate using monetary tools such as interest rate changes (Coy, 2005). Under the policy, the actions of the central bank become more transparent. Investors, knowing what the central bank projects as the target inflation rate, can easily factor in possible interest rate changes in their investment sets, leading to better economic stability. Many industrialized economies, after experiencing persistent inflation rates for decades, have reduced inflation to extremely low levels recently with the aid of inflation targeting. Inflation targeting frameworks have regularly been adopted in economies suffering from chronically high inflation. Brazil and Chile, for instance, suffered inflation rate of 19 percent and 26 percent, respectively, before adoption of inflation targeting regime. A popular choice since the early 1990s, inflation targeting has gained adherence from more than twenty countries in developed and emerging-market economies. Countries have adopted inflation targeting under varying conditions, ranging from the answer to a currency crisis (e.g. United Kingdom) to a planned switch from a completely different policy regime (e.g. Canada and New Zealand). Likewise inflation targeting has been practiced with varying verve and under diverse institutional arrangements (Bamidele, 2007).

Forged in 1990 in New Zealand, inflation targeting is now in use by the central banks of Canada (Bank of Canada), United Kingdom (Bank of England), Australia (Reserve Bank of Australia), Iceland (Central Bank of Iceland) South Korea (Bank of Korea), Egypt, and Brazil (Brazilian Central Bank) South Korea (Bank of Korea), and Brazil (Brazilian Central Bank) and South Africa (South African Reserve Bank), among others, and empirical evidence shows that it does what its proponents claim (Coy, 2005). Only two countries, in Sub-Saharan Africa, have officially embraced inflation targeting: Ghana and South Africa

(Hajj et al., 2013). Volatility in price and hyperinflation are huge economic challenges, able to engender financial instability and topple economies. One of the issues facing Nigeria today is the choice among two nominal anchors: exchange rate pegging or inflation targeting. Widely accepted, among central bankers and academics, is the idea that inflation targeting makes a difference with respect to its ability to mitigate the volatility of output and of inflation and to bring about a decline in the level of inflation (Hajj et al., 2013). There is an argument that inflation targeting cannot work well in emerging markets, like Nigeria, as emerging markets are deficient of the preconditions for a proper operation of inflation targeting. According to Kadioğlu et. al (2000), the prerequisites for the success of inflation targeting consist of sound economic structure; exchange rate flexibility; central bank independence; the institutional set-up; political commitment; a great deal of transparency and accountability of the Central Bank; absence of fiscal dominance; a single, clear inflation target; a sound inflation forecasting model; virile financial markets. The absence or inadequacy of these prerequisites may pose huge challenges for emerging markets like Nigeria trying to embrace inflation targeting.

Besides, inflation targeting and the exchange rate flexibility have a close relationship. Exchange rate, a vital instrument in an open economy like Nigeria, plays as a transmission channel for monetary policy and simultaneously as an influencer of the real economy. Undue volatility of exchange rate can be injurious to trade and growth. Thus, responding to inflation and exchange rate variability conjointly in the policy function can lead to the risk of tradeoff or compromise between inflation and exchange rate variability. If, for example the central bank sees impending increase in inflation; to tighten the price of tradable goods, interest rates are raised. As soon as the inflation is under control, interest rates are lowered and the exchange rate depreciates. Thus the fall in inflation variability has brought about the rise in the volatility of exchange rate. Exchange rate stability is inconsistent with inflation targeting regime; inflation targeting regime certainly necessitates exchange rate flexibility (Debelle, 2000).

Foreign exchange intervention policy and inflation targeting, according to Brenner & Sokoler (2006), cannot coexist because there is conflict between the two policies. Taguchi and Kato's (2011) assessment of inflation targeting in some East-Asian economies shows that flexibility in exchange rate is a prerequisite to the success of inflation targeting regime. Then again, there are contradictory views that intermediate regimes would be good for inflation targeting. In fact, the case of Chile and Israel show that exchange rate objectives is containable within an inflation targeting regime (Debelle, 2000). Can inflation targeting regime work effectively in Nigeria which employs the exchange rate stability objectives? Bakradze and Billmeier's (2007) study observed that the rising number of countries embracing inflation targeting and its success are inducements for countries that employ monetary or exchange rate targeting to consider a change to inflation targeting. Thus, countries like Nigeria need to consider earnestly such a change now or in the near future, necessitating the question if Nigeria is ready for inflation targeting now, later or maybe never.

Table 1: Monetary Policy Outcomes (2005-2012)

	2005	2006	2007	2008	2009	2010	2011	2012
Inflation, consumer prices (annual %)	17.86349	8.239527	5.382224	11.57798	11.53767	13.7202	10.84079	12.21701
GDP growth (annual %)	5.4	6.211018	6.971709	6.270264	6.934416	7.839739	6.791379	6.531369
Money and quasi money growth (annual %)	22.60363	36.35072	64.41681	53.36007	14.54323	9.968683	13.1423	17.41589
Real Interest Rate	-1.51329	-2.21439	11.76407	4.190484	23.7065	-7.23133	12.41647	14.87001
Domestic credit provided by financial sector (% of GDP)	8.600411	4.909406	16.5753	24.89094	37.77162	30.00878	35.80004	35.61685
Real Exchange rate	100	107	104.8	116.4	109	117.9	119.7	119.8

This table shows the evolution of the monetary policy outcomes in Nigeria from 2005 till 2012. It shows the quantum of monetary policy in Nigeria.

Figure 1: Monetary Policy Outcomes (2005-2012)

This figure shows the evolution of the monetary policy outcomes in Nigeria from 2005 till 2012. It shows the size and trend of the variables, thus depicting the thrust of monetary policy in the recent years.

A look at Table 1 and Figure 1 shows that interest and inflation rates in Nigeria have been on a double-digit value averagely over the period of 2005-2012. In recent years, inflation in Nigeria has been steadily above 10%, except 2007. As well, interest rate has been high, especially prohibitively highest in 2011 and 2012. The real exchange rate against the US dollar soars over the years. In the same vein, the consumer price index (CPI) is not left out in the steady increase. Within the same period, money and quasi money growth has reduced while Domestic credit provided by financial sector (% of GDP) has increased phenomenally. The increase in interest rates, exchange rates, relentless growth in money supply and domestic credit have all accreted, leading to persistent inflation in Nigeria. At this instant, it is crucial to project a workable nominal anchor to keep inflation in check because the present exchange rate pegging seems feckless. Consequently, this study examines inflation targeting as a possible monetary framework for Nigeria. This paper is structured such that Section 2 reviews the literature. Section 3 presents the data and methodology. Sections 4 gives the results. Section 5 gives the conclusion.

LITERATURE REVIEW

Till date, diverse have been the outcome of prior studies on the performance of inflation targeting. The first set of empirical studies finds no significant improvement in the economies between pre- and post-inflation targeting or between the economies of inflation-targeting countries and non- inflation targeting countries (for examples Cecchetti & Ehrmann, 2000; Honda, 2000; Ball & Sheridan, 2005; Berument & Yuksel, 2006). The second set finds meaningful improvement as inflation targeting causes improvement in economic structure and inflationary path (for examples Garcia, 2000; Pétursson, 2004 and so on). Yet, a set of studies, constructing indicators to measure the impact of inflation targeting, evaluates the performance of inflation targeting through disinflation cost and observations of country-specific data (e.g. Pétursson, 2004). Some authors assess the impact of inflation targeting from the perspective of the cost of disinflation (i.e. the ratio of loss in output divided by the fall in inflation). The studies, evaluating the impact of inflation targeting employing the cost of disinflation include Senda & Smith, 2008 Tunali, 2008; Goncalves & Carvalho, 2006 and so on.

All this previous works have shown that the performance of inflation targeting differs across dimensions, countries and over time (Ramos-Francia & Capistran, 2007; Mishkin & Schmidt-Hebbel, 2007). As well, evidence suggests that the credibility of the central bank and the economic structure are factors in the various outcomes of inflation targeting. For instance, Fraga, Goldfajn & Minella's (2003) study demonstrates that inflation targeting is more successful in developed economies compared to emerging market economies in terms of reduced volatility in output, inflation, exchange rate and interest rate. Additional factors shaping the performance of inflation targeting include type of demand or supply shock (Lai & Chang, 2001) and exchange rate (Bleaney, 2000 and Brenner & Sokoler, 2006).

Mthuli Ncube and Eliphaz Ndou (2012), using a Bayesian VAR sign restriction approach, derives the inflation equation to comb for a plausible transmission channel between the inflation rate, real interest rate, exchange rates and real output growth rate. The empirical findings indicate that the real interest rate responds negatively to inflation rate shocks; in the long run the Fisher effect holds. They demonstrate that strict inflation targeting is incompatible with significant output growth. Conversely, a flexible inflation-targeting framework which places importance on real effective exchange rates leads to a significant real output growth. Hajj, Dufrénot, Sugimoto and Wolf's (2013) study examines the monetary policy actions with which Sub-Saharan African central banks have sought to reduce or eliminate the negative consequences of the shocks confronting their economies. Comparing two types of monetary policy regimes: a currency board regime in the CFA zone countries and an inflation targeting policy regime in Ghana and South Africa, they found that both policies are unsuitable for economies exiting from the impacts of negative demand shocks. However, both policies are vital when negative shocks to primary balance arise. Alvaro Angeriz and Philip Arestis (2006), using intervention analysis on structural time series models of ten countries, investigates the empirical aspects of inflation targeting. The outcome shows that if the initial impacts of inflation targeting are taken into consideration, central banks, that have followed this strategy, have been unsuccessful.

Sek (2006) evaluates inflation targeting in three emerging East-Asian economies: Korea, Philippines and Thailand by comparing the changes in the economy between the pre- and post- inflation targeting periods. Applying a bivariate GARCH (1,1) model to study the relationship between inflation and output gap, he detects lower inflation rate in the post-IT period and no significant correlation between inflation and output gap was found. He concludes that inflation targeting has bettered the economies of those countries.

DATA AND METHODOLOGY

Model

After a meticulous review of foregoing studies and refining upon the theoretical postulates explicated above, the two models for this study are expressed as follows:

$$\text{INFLATION} = \alpha_0 + \alpha_1 \text{GROWTH} + \alpha_2 \text{MONEY} + \alpha_3 \text{INTEREST} + \alpha_4 \text{CREDIT} + \alpha_5 \text{EXCHANGE} + \alpha_6 \text{EXPENDITURE} + \alpha_7 \text{OIL} + \alpha_8 \text{TRADE} + \alpha_9 \text{CAPITAL} + \phi \quad (1)$$

$$\text{GROWTH} = \Pi_0 + \Pi_1 \text{INFLATION} + \Pi_2 \text{MONEY} + \Pi_3 \text{INTEREST} + \Pi_4 \text{CREDIT} + \Pi_5 \text{EXCHANGE} + \Pi_6 \text{EXPENDITURE} + \Pi_7 \text{OIL} + \Pi_8 \text{TRADE} + \Pi_9 \text{CAPITAL} + \Omega \quad (2)$$

Where,

INFLATION = Inflation, consumer prices (annual %)

GROWTH = GDP growth (annual %)

MONEY = Money and quasi money growth (annual %)

INTEREST = Real interest rate

CREDIT = Domestic credit provided by financial sector (% of GDP)

EXCHANGE = Real exchange rate

EXPENDITURE = Recurrent government expenditure

OIL = Oil revenue

TRADE = Trade openness

CAPITAL = Gross capital formation

Vector Autoregressive Model

The vector autoregressive model (VAR) is used to analyse the variables' system. Each endogenous variable of the system is a function of the lagged values of the endogenous variables.

The VAR model is as follows:

$$y_t = A_1 y_{t-1} + A_2 y_{t-2} + \dots + A_p y_{t-p} + c + \varepsilon_t \quad (1)$$

Where:

y_t is a vector of n endogenous variables,

x_t is a vector of m exogenous variables,

A_1, A_2, \dots, A_p are matrices of the parameters being estimated

c is the constant term

ε_t is a vector of terms produced by a white noise process with these properties:

$$E[\varepsilon_t] = 0 \quad \forall t$$

$$E[\varepsilon_t \varepsilon'_t] = \begin{cases} \Omega & s = t \\ 0 & s \neq t \end{cases} \quad (2)$$

This shows that the ε 's are serially uncorrelated.

Granger Causality

The Granger (1969) approach is used to investigate how much of the current y is explained by the lagged values of y and if, after adding past values of x we can increase the explanation of the model. Succinctly, we say "x Granger causes y" if the coefficients of the lagged variables of x are statistically significant.

The Granger causality entails the estimation of two regressions like the following:

$$y_t = \alpha_0 + \alpha_1 y_{t-1} + \dots + \alpha_l y_{t-l} + \beta_1 x_{t-1} + \dots + \beta_l x_{t-l} + \varepsilon_t \quad (3)$$

$$x_t = \alpha_0 + \alpha_1 x_{t-1} + \dots + \alpha_l x_{t-l} + \beta_1 y_{t-1} + \dots + \beta_l y_{t-l} + u_t$$

for all the possible values of the series (x, y).

The Granger causality test implies the F Wald test for the joint hypotheses $\beta_1 = \beta_2 = \dots = \beta_l = 0$ for each equation. The hypotheses are expressed as:

H_0 : 'x does not Granger cause y', in one equation, and

H_1 : 'y does not Granger cause x', in the other.

This test statistic can be expressed as:

$$F = \frac{(SQEr - SQEnr)/m}{SQEnr/(n-k)} \quad (4)$$

Where:

m is the number of lagged terms of Y

k is the number of parameters estimated without restrictions,

SQEr is the sum of squared errors in the restraint regression (when H_0 is true) and SQEnr is the sum of squared errors with the unrestricted regression. With m and $n-k$ degrees of freedom, this statistic follows the F-distribution.

Impulse Response Function

Modeled in the framework of a vector autoregression, the impulse response functions are used to describe how the economy responds over time to shocks or exogenous impulses. Succinctly, it is used to describe the reaction of endogenous variables such as inflation, GDP growth, money growth, interest rate, and exchange rate at the time of the shock and over succeeding points in time.

Data Bank

The data covers the year 1980-2012. The values employed in the empirical analysis were mined from the data banks of the World Bank and the Central Bank of Nigeria. They are published on their *sites* www.cenbank.org/documents/data.asp and data.worldbank.org/Indicators. They are Inflation, consumer prices (annual %); GDP growth (annual %); money and quasi money growth (annual %); real interest rate; domestic credit provided by financial sector (% of GDP); real exchange rate; growth rate of recurrent government expenditure, growth rate of oil revenue, growth rate of trade openness and growth rate of capital formation.

RESULTS

Each of the time-series is tested to determine their order of integration, using the KPSS test. Since most of the time series have the same order of integration, we tested and saw they are cointegrated, using Johansen's methodology. Thus, the VAR model is set up in the levels of the data. 2 is the maximum lag length for the variables in the VAR, based on the AIC. The VAR is well-specified; we ensure that no serial correlation exists in the residuals for a reliable result. Straight interpretation of VAR model is very longwinded and can lead to poor conclusions. Instead, this study interprets the Granger causality test and impulse response functions (IRF).

Granger Causality Tests

The Granger (1969) test is employed to test for causality, providing an evaluation of causation from one variable to the other.

From the results in Table 2, the following causalities have been detected:

Causation from MONEY to INFLATION suggesting that the amount of money in the economy determines the quantum of inflation

Causation from the CREDIT to INFLATION suggesting that the amount of credit in the economy determines the quantum of inflation

Causation from the REAL EXCHANGE RATE to INFLATION suggesting that the level of real exchange rate determines the quantum of inflation

Causation from GOVERNMENT RECURRENT EXPENDITURE to INFLATION suggesting that the amount of government recurrent expenditure in the economy determines the quantum of inflation

Causation from INFLATION to ECONOMIC GROWTH suggesting that the amount of inflation in the economy determines the quantum of inflation

Causation from REAL EXCHANGE RATE to ECONOMIC GROWTH suggesting that the level of real exchange rate determines the quantum of inflation

Causation from GROSS CAPITAL FORMATION to ECONOMIC GROWTH suggesting that the amount of gross capital formation in the economy determines the quantum of inflation

The causation from REAL EXCHANGE RATE to ECONOMIC GROWTH is stronger than the causation from INFLATION to ECONOMIC GROWTH suggesting that exchange rate determines economic growth in Nigeria more than inflation. Thus, inflation targeting will be less preferable to exchange rate targeting in Nigeria as a policy alternative.

Table 2: Granger Causality Wald Tests

	Excluded	chi2	df	Prob > chi2
INFLATION	GROWTH	4.0522	2	0.132
	MONEY	12.616	2	0.002
	INTEREST RATE	0.1428	2	0.931
	CREDIT	15.764	2	0.000
	EXCHANGE RATE	17.019	2	0.000
	EXPENDITURE	7.0143	2	0.030
	OIL REVENUE	0.3385	2	0.844
	TRADE	1.3036	2	0.521
	CAPITAL	1.3453	2	0.510
	ALL	91.822	18	0.000
	GROWTH	INFLATION	5.8941	2
MONEY		3.5632	2	0.168
INTEREST RATE		2.154	2	0.341
CREDIT		3.7545	2	0.153
EXCHANGE RATE		6.7108	2	0.035
EXPENDITURE		1.1108	2	0.574
OIL REVENUE		1.2338	2	0.540
TRADE		3.5495	2	0.617
CAPITAL		.96677	2	0.020
All		32.301	18	0.020

*This table suggests that exchange rate determines economic growth in Nigeria more than inflation does. Thus, inflation targeting will be less preferable to exchange rate targeting in Nigeria as a policy alternative. *** and ** denote rejection of the exclusion at the 1 and 5 per cent level.*

The graph on the top shows that Economic Growth responds positively to innovations (i) in its own impulses over the 10 years period and (ii) in real exchange rate over the 10 years period. It responds negatively to innovations (i) in inflation over the 10 years and (ii) in real interest rate over the 10 years. The figure shows that the intensity of economic growth reaction is greater for exchange rate, interest and inflation, than for money and the reaction stays steady and durable. The second graph shows that inflation responds positively to innovations (i) in its own impulses over the first 7 years period and (ii) in money over the first 6.5 years. It responds negatively to innovations (i) in the interest rate over the first 4 years, (ii) in economic growth over the first 3.5 years, and (iii) in the exchange rate over the 5 years. The figure shows that the intensity of inflation reaction is greater for exchange rate and interest, than for money and economic growth and the reaction stays steady and durable. Summarily, the impulse response function shows that inflation is highly sensitive to exchange rate and interest rate while economic growth is highly sensitive to exchange rate and inflation.

Impulse Response Functions

Figure 2: Impulse Response Functions

This figure shows the impulse response functions (IRF) to appreciate the reaction of the inflation and the economy at large to an innovation or impulse of one standard error in its own and in the other monetary aggregates. Only the response of INFLATION and GROWTH to impulses of 1 standard deviation (sd) are included so as to prevent this paper from becoming too large.

CONCLUDING COMMENTS

The paper has examined inflation targeting as a possible monetary framework for Nigeria. Particularly, the paper has focused on the relative causality and responses between economic growth, inflation, exchange rate, interest rate, money and credit. The empirical methodology uses Granger causality and impulse response functions. As to the empirical results of the paper, we have evidence that inflation is highly sensitive to exchange rate and interest rate while economic growth is highly sensitive to exchange rate and inflation in Nigeria. Further, the causation from real exchange rate to economic growth is stronger than the causation from inflation to economic growth, meaning exchange rate determines economic growth in Nigeria more than inflation does. Therefore, inflation targeting will be less preferable to exchange rate targeting in Nigeria as a policy alternative. This unexpected finding has important implications for monetary policy conduct in Nigeria.

AMBIVALENCE AND INTERACTION IN E-LEARNING: A CANADIAN STUDY

Anamitra Shome, Brock University
Huzaiifa Faizan, Brock University

ABSTRACT

This study explored student attitudes towards online learning in the context of an advanced cost accounting course being taught online at a mid-sized Canadian university in an asynchronous online environment. We hypothesized that students enrolled in an online course on advanced cost accounting would exhibit well-defined attitudes (either positive or negative) towards the course and that students enrolled in an online course on advanced cost accounting encouraging online interaction would exhibit well-defined positive attitudes towards the course. Students enrolled in the course were given a voluntary and anonymous survey that comprised of questions relating to the course evaluation, student satisfaction with the course, student attitudes towards the online learning experience, and student opinions regarding opportunities for student-instructor interaction. The results from the 73 respondents were somewhat paradoxical—on the one hand, there seemed to be significant positive (well-defined) attitudes towards the course, while on the other hand, students appeared to perceive no difference between OL and TCL. The results indicate that although students found the course to be satisfying, they are basically ambivalent about traditional classroom learning versus online learning. This finding has implications for the continued push towards e-learning.

INTRODUCTION

The push towards online courses in universities across the world is a strategic attempt to create a market niche in distance education. In the face of increasingly intense competition from "virtual" universities, this is being accomplished by investing in information and communication technologies (ICT) in order to provide opportunities for online learning (Curtis and Lawson, 2001). Several advantages in employing ICT for course delivery are perceived, including opportunities for lowering costs, improving access, and improving the quality of educational outcomes (Kitto and Higgins, 2003). Despite the increased push towards e-learning, do students perceive online courses to be more beneficial than face-to-face ones? Do they perceive them to be less beneficial than F2F ones? Do they even have an opinion? The evidence is still inconclusive. For instance, Siew (2003) found that most students prefer traditional modes of instruction consisting of lectures and tutorials once the novelty of computer-assisted learning wears off. Power and Gould-Morven (2011) noted that despite the fact that online learning (OL) is becoming widely accessible and is often viewed as cutting-edge, it is frequently associated with high rates of student dissatisfaction, isolation, withdrawal, and attrition. They also observe that administrators typically support OL, yet they often seem unable or unwilling to allocate the necessary financial, human, and technological resources to produce high-quality course materials to carry out efficient course delivery, concluding that OL is unlikely to become mainstream or a first choice in education without a major redirection.

Motivated by the objective of exploring student attitudes towards online learning in the context of advanced cost accounting, we conducted a study at a mid-sized Canadian university where students took the course

online. Our results indicate that student performance was reasonably high, and students demonstrated that they had positive reviews toward the course. Additionally, they appear to perceive that the course offered them many opportunities for interaction with the instructor. Despite this, we find that students held an ambivalent attitude towards the online experience. We find this result to be cause for thought, considering the strong push towards online learning in universities around the world and Canadian universities in particular.

LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

There is an extensive body of literature on distance learning that focuses on the advantages and disadvantages of distance learning using ICT-enabled modes of delivery. The benefits for learners include increased understanding, closer engagement with content, learner motivation, collaboration, skills development, increased learning and greater efficiency. Disadvantages include technical problems, learner isolation, and lack of learner motivation, readiness, and contact with the instructor (Coomey and Stephenson, 2001). Student attitudes towards online learning are considered to be an important factor affecting student performance (Ku and Lohr, 2003). There is a significant body of research on student attitudes towards the use of instructional technology as well as online learning. Using measures of learning and student cognitive styles, Federico (2000) found that students with assimilating and accommodating learning styles demonstrated significantly more agreeable attitudes towards varied aspects of network-based instruction than students with converging and diverging learning styles. Ku and Lohr (2003) studied a group of Chinese students enrolled in an online course on instructional design at an American university to ascertain their attitudes towards their online learning experience, and compare them with their attitudes towards a traditional learning environment. The researchers found that although the Chinese students were not very different from their American peers in terms of their attitudes towards the course, they were ambivalent about the online learning experience.

Sanders and Morrison-Shetlar (2001) investigated the attitude of undergraduate students taking a general biology course online at a midsized rural university. They found that the online experience had a highly positive effect on student learning as well as students' problem-solving and critical-thinking skills. Females demonstrated significantly more positive attitudes towards the online experience than males, and accessed the online material more often than males. The researchers did not find any relationship between student attitudes and learning styles. Steele et al. (2002) explored the relationship between learning preferences, attitudes towards computers, and student evaluation of a computer-assisted instructional (CAI) program in the context of a required course in surgery at a teaching hospital. They did not find any relationship between learning preferences, attitudes towards computers, and the evaluation of the CAI program. In contrast to Steele et al. (2002), Drennan et al. (2005) found that student satisfaction is influenced by positive perceptions towards technology and an autonomous learning mode. Their results also suggested that those students who were willing to try new approaches and take risks were more likely to view the technology positively and perceive higher usefulness. Tynan and Colbran (2006) observed similar results in a study on podcasting involving 1,244 law students. They found that the vast majority of the students perceived podcasting (particularly lectures and to a lesser extent tutorials) as having great value and even leading to an alteration in study habits.

Arguing that individual attitudes towards e-learning are important for predicting and improving e-learning usage, Liaw et al. (2007) investigated the attitudes of both learners as well as instructors towards e-learning. Levy (2007) observed that students' satisfaction with e-learning is a key indicator in their decision to drop out from e-learning courses. Dropout students (non-completers) indicated experiencing significantly lower satisfaction with e-learning than students who successfully completed the same e-learning courses. Academic locus of control did not have any impact on students' decision to drop out from e-learning courses. Conole et al. (2008) carried out a series of in-depth case studies using an online survey, audio logs and interviews to investigate two questions: How do learners engage with and experience e-learning; and

how does e-learning relate to and contribute to the entire learning experience. They found that students are immersed in a rich, technology-enhanced learning environment that they select, appropriating technologies to their own personal learning needs. Tang and Austin (2009) suggest that instructors using ICT to deliver courses may benefit from using a mix of different technologies tailored to students' learning needs as well as their attitudes towards different instructional technologies. The findings reported above seem to indicate that the evidence for student attitudes towards and student preferences for online instruction is mixed. While the more recent studies, notably Drennan et al. (2005), Tynan and Colbran (2006), and Tang and Austin (2009) find a positive association between student attitudes towards online or ICT-enabled learning and student performance, older studies, notably Steele et al. (2002), and Ku and Lohr (2003) do not find any such association. This could be a function of the fact that with the passage of time, students' increasing use of ICT has served to foster well-defined attitudes towards it. This paper attempts to provide further evidence on student attitudes towards online learning in the context of an online course on advanced cost accounting taken by Accounting majors at a mid-sized Canadian university. Based on the more recent studies referred to above, we hypothesize that these students will exhibit well-defined attitudes towards online learning:

H1: Students enrolled in an online course on advanced cost accounting will exhibit well-defined attitudes (either positive or negative) towards the course.

The role of interaction in online learning has been widely investigated. Curtis and Lawson (2001) studied students' textual interactions in an OL environment. Although they did find substantial evidence of collaboration, they also found differences between conventional face-to-face instances of collaborative learning and what occurs in an asynchronous, networked environment. Siew (2003) investigated the use of an online assessment tool that provided interactive feedback to students learning linear algebra. The success of the tool was measured in terms of improved pass rate and students' satisfaction in the flexible learning opportunities that the tool offered. Students found the tool to be of significant benefit in succeeding in the course. Dönmez et al. (2010) carried out a study on what motivates learners to succeed in online learning environments. They introduced learner-environment interaction using two different approaches: the reporting capabilities of a learning management system, and a web-based innovative coding environment called hasLOGO. They found that the interaction had beneficial effects.

Lobry de Bruyn (2004) assessed the use of asynchronous computer-mediated communication and the degree of convergence and level of social presence as indicators of developing highly responsive and interactive learning environments in the context of an inquiry-based learning activity, using a case study approach with problem solving and self-directed research. She found that threaded asynchronous online discussions were beneficial to students. Kitto and Higgins (2003) examined how online educational software programs rearticulate student/lecturer relations by using the capabilities of a learning management system to track students' activities online as well as the pages "hit" by students. They find that these capabilities offer instructors the ability to monitor student performance from a distance, thus influencing student performance. Picciano (2002) studied student performance in an online course in relationship to student interaction and sense of presence in the course. He found that the relationship of actual measures of interaction and performance is mixed and inconsistent depending upon the measures employed. In keeping with Moore (2001), who asserted that it is pointless for instructors to use an interactive medium if they do not structure and encourage interaction, we incorporated several ways that students enrolled in the course could engage with the instructor and the teaching assistants as well as with each other. In addition, we strongly encouraged interaction by responding to student queries and comments within 24 hours at the latest (in practice, response time was far shorter). By providing these opportunities for interaction, we hypothesized that students would perceive the online learning experience to be positive and beneficial. This may be stated in terms of the following hypothesis:

H2: Students enrolled in an online course on advanced cost accounting encouraging online interaction will exhibit well-defined positive attitudes towards the course.

METHODOLOGY

Participants

Accounting majors who were enrolled in an online course on advanced cost accounting at a mid-sized Canadian university were asked to respond to a survey asking them for their perceptions of the course.

Instrument

The survey was voluntary and anonymous, and was comprised of two sections. The first section contained ten standard university-prescribed questions relating to course evaluation. One of the most important questions on the survey from the point of view of the university is question 9: overall evaluation of the course, on a scale of 1 = poor to 5 = excellent. This is taken as an indicator of student satisfaction with the course. The second section of the survey contained eleven questions designed to ascertain student satisfaction with the course, student attitudes towards the online learning experience, and student opinions regarding the suitability of the online approach for this particular course.

Course Design

The course itself was designed to be primarily asynchronous, with students not being required to go online at any specific time. Course content was divided into weekly lessons that were released to the students each week according to dates specified in the course outline. Each lesson came with a clear set of instructions that specified the learning objectives of the lesson, the multimedia material associated with the lesson (mainly “concepts” videos in which the instructor explained the concepts relating to the lesson; as well as “walkthrough” videos in which the instructor “walked” the students through the solutions to specific problems and cases from the chapter without actually), as well as the quizzes associated with the lesson. Quizzes were of two types: practice quizzes without any time restrictions that the students could take multiple times and get instant automated feedback on each time; and online knowledge assessment exercises (OKAEs) that were available only for a 24-hour period and could be taken a maximum of two times. No feedback was available for the OKAEs. The midterm and final examinations were held on campus. Students had numerous avenues open to them for interaction with the instructor as well as the support team of teaching assistants. Most of the interaction with the instructor and his support team took place through the online channels provided.

RESULTS

We categorized the statements that the students were responding under three main categories: overall satisfaction with the course; perceived performance in relation to traditional versus online learning, and perceptions regarding student-instructor interaction. Descriptive statistics regarding these variables are presented in Table 1.

Hypothesis 1 posits that students enrolled in an online course on advanced cost accounting will exhibit well-defined attitudes (either positive or negative) towards the course. The hypothesis relates primarily to the first and second categories of questions: satisfaction with the course and perceived performance. We tested this hypothesis using one-sample t-tests for each of the nine variables relating to the hypothesis. The results of the t-tests are presented in Table 2.

Table 1: Descriptive Statistics

Overall satisfaction with the course						
Variable name	Statement	N	Mean	SD	Skewness	Kurtosis
overeval	Overall evaluation of the course	73	3.425	1.178	-0.575	-0.912
achdgoal	I achieved all of the goals I wanted to achieve on this course.	72	3.444	1.509	-0.396	-1.134
Perceived performance in relation to traditional vs online learning						
Variable name	Statement	N	Mean	SD	Skewness	Kurtosis
corsform	The format of the course (traditional classroom versus online) would have made no difference to my overall grade on the course.	72	2.500	1.289	0.284	-0.653
perfbetr	I found that the online lectures helped me perform better on the course than I would have done in a traditional face-to-face classroom setting.	72	2.750	1.536	0.219	-1.259
notaswel	I would not have performed as well as I did on this course had it been offered in a traditional classroom setting.	71	2.859	1.323	0.076	-0.656
somebetr	I would have performed somewhat better on this course had it been offered in a traditional classroom setting.	72	3.111	1.295	-0.052	-0.546
muchbetr	I would have performed much better on this course had it been offered in a traditional classroom setting.	71	2.859	1.323	0.076	-0.656
tradgoals	I would have achieved all my goals had this course been offered in a traditional classroom setting.	71	2.803	1.316	0.105	-0.640
failgoal	If I failed to achieve all my goals, it was primarily because this course was offered online.	71	2.324	1.584	0.688	-1.057
Perception regarding student-instructor interaction						
Variable name	Statement	N	Mean	SD	Skewness	Kurtosis
dintmiss	I did not miss the classroom interaction with the professor because of the many ways I could reach him.	72	2.890	1.570	0.099	-1.360
diddmiss	I missed the classroom interaction with the professor.	72	3.580	1.590	-0.578	-1.176
openways	There were several avenues open to me to interact with the professor.	70	4.310	1.123	-1.413	1.098

In terms of satisfaction with the course, *overeval* (overall evaluation of the course) the mean score is 3.425 (on a scale of 1 = poor to 5 = excellent). The t-statistic for this variable is 3.081 ($p < 0.05$), indicating that students experienced strong overall satisfaction with the course. This finding provides support for hypothesis 1, which posits that students will have clearly defined attitudes about the course. The second variable relating to satisfaction with the course (*achdgoal*) concerns the achievement of students' goals for the course. The mean score for this variable is 3.444, while the t-statistic is 2.498 ($p < .05$). This result indicates a significant level of agreement with the statement, thus providing strong support for hypothesis 1. Our second category of variables addressed students' perceptions of performance as a function of the format of the course, traditional face-to-face versus online instruction. This is the largest category, comprising of seven variables. The first variable, *corsform* seeks to capture students' overall attitudes towards online learning as opposed to classroom learning. The mean score for this variable is 2.500, and the t-value is -3.291 ($p < 0.05$). The results for this variable indicate strong support to hypothesis 1 which posits that students will hold clearly-defined attitudes towards online learning. The second variable in this category is *perfbetr*. The mean score for this variable is 2.750, and the t-value is -1.381 ($p > 0.15$). The results for this variable indicate that students do not agree with the statement on the whole, demonstrating a negative attitude towards online learning. However, the results are not strong enough to be supportive of the hypothesis that students hold clearly-defined views on e-learning. The third variable in this category is *notaswel*. The mean score for this variable is 2.859 and the t-value is -0.897 ($p > .20$). The results indicate that students on average disagree with the statement, yet the disagreement is not strong enough to provide support for hypothesis 1.

Table 2: Results of Hypothesis Testing

Overall satisfaction with the course					
Variable name	Statement	N	Mean	t-value	Sig. (2-tailed)
overeval	Overall evaluation of the course	73	3.425	3.081	0.003
achdgoal	I achieved all of the goals I wanted to achieve on this course.	72	3.444	2.498	0.015
Perceived performance in relation to traditional vs online learning					
Variable name	Statement	N	Mean	t-value	Sig. (2-tailed)
corsform	The format of the course (traditional classroom versus online) would have made no difference to my overall grade on the course.	72	2.500	-3.291	0.002
perfbetr	I found that the online lectures helped me perform better on the course than I would have done in a traditional face-to-face classroom setting.	72	2.750	-1.381	0.172
notaswel	I would not have performed as well as I did on this course had it been offered in a traditional classroom setting.	71	2.859	-0.897	0.373
somebetr	I would have performed somewhat better on this course had it been offered in a traditional classroom setting.	72	3.111	0.728	0.469
muchbetr	I would have performed much better on this course had it been offered in a traditional classroom setting.	71	2.859	-0.897	0.373
tradgoals	I would have achieved all my goals had this course been offered in a traditional classroom setting.	71	2.803	-1.262	0.211
failgoal	If I failed to achieve all my goals, it was primarily because this course was offered online.	71	2.324	-3.597	0.001
Perception regarding student-instructor interaction					
Variable name	Statement	N	Mean	t-value	Sig. (2-tailed)
dintmiss	I did not miss the classroom interaction with the professor because of the many ways I could reach him.	72	2.890	-0.600	0.550
diddmiss	I missed the classroom interaction with the professor.	72	3.580	3.113	0.003
openways	There were several avenues open to me to interact with the professor.	70	4.310	9.788	0.000

The fourth variable under this category is *somebetr*. The mean score for this variable is 3.111, the t-value is 0.728 ($p > .20$). The results indicate students' lukewarm acceptance of this statement, but do not provide strong support for hypothesis 1. The fifth variable under this category is *muchbetr*. The mean score for this variable is 2.859, the t-value is -0.897 ($p > .20$). The results indicate students' lukewarm disagreement with this statement, but do not provide strong support for hypothesis 1. The sixth variable under this category is *tradgoals*. The mean score for this variable is 2.803, the t-value is -1.262 ($p > .20$). As in the case of the preceding variable, the results indicate students' lukewarm disagreement with this statement, but do not provide strong support for hypothesis 1. The final variable in this category is *failgoal*. The mean score for this variable is 2.324, the t-value is -3.597 ($p < .05$). This result indicates that student strongly disagree with the statement, indicating a well-defined positive attitude towards the course. The results provide strong support for hypothesis 1.

Hypothesis 2 posits that students enrolled in an online course on advanced cost accounting encouraging online interaction will exhibit well-defined positive attitudes towards the course. The three variables that address this hypothesis are *dintmiss* (I did not miss the classroom interaction with the professor because of the many ways I could reach him), *diddmiss* (I missed the classroom interaction with the professor) and *openways* (there were several avenues open to me to interact with the professor). The mean score for *dintmiss* is 2.890 and the t-value is -0.600 ($p < .50$). This variable seeks to capture whether students perceived that the course offered several avenues for interaction with the instructor. Results show that students on average neither agree or disagree with the statement, indicating a certain ambivalence about

this aspect of the course. The next variable in this category, *diddmiss* (I missed the classroom interaction with the professor) again seeks to ascertain whether students perceived that the course offered several avenues for interaction with the instructor. Interestingly enough, although this variable is basically the same as *dintmiss* (albeit worded differently with reference to available options) the mean score for this variable is 3.580 and the t-value is 3.113 ($p > .05$). The results indicate that on average, students disagree significantly with the statement, thus demonstrating that they thought the interaction offered to them through the online course was adequate. This result is paradoxical in view of the results for *dintmiss*. The third variable in this category, *openways* (there were several avenues open to me to interact with the professor) again seeks to capture students' perceptions of the interaction component of the course. The mean score for this variable is 4.310 and the t-value is 9.788 ($p > .05$). This result strongly indicates that students perceived that there were many opportunities available to interact with the instructor. Although inconsistent with the results for *dintmiss*, the result is consistent with that for *diddmiss*. Although the results of this hypothesis are paradoxical in context, there is support in relation to the hypothesis itself.

CONCLUDING COMMENTS

This paper reports on a study conducted with students at a mid-sized Canadian university who were taking a course on advanced cost accounting that was being offered for the first time in an online format. The results do provide some support for the hypothesis that students have well-defined attitudes towards online learning. Students rated the course highly, indicating a positive attitude towards OL. In addition, they indicated significant disagreement with the statement that they failed to achieve their goals because the course was offered online. Taken together, these results indicate that students perceived the course positively, in turn indicating a positive attitude towards OL. However, the results relating to the other variables tested indicate a lack of support for hypothesis 1. The results are somewhat paradoxical—on the one hand, there seem to be significant positive attitudes towards the course, while on the other hand, students appear to perceive no difference between OL and TCL. The results indicate, therefore, that although students found the course to be satisfying, they are ambivalent about traditional classroom learning versus online learning.

VALUE OF NOT-FOR-PROFIT SECTOR IN AUSTRALIA: A NOTHERN TERRITORY PERSPECTIVE

Abhishek Shukla, Charles Darwin University

ABSTRACT

Not-for-Profit-Sector in Australia has emerged as a large and diverse sector covering activities and services including health, social services, education, arts, sports, human rights and culture. Despite its significance, it is hard to get an accurate snapshot of the contribution of this sector. It has escaped detailed academic scrutiny in the past few decades since its emergence. Traditional economic measures often don't capture some of the most important work undertaken by this sector and hence are found inadequate. This paper attempts to identify key value indicators of the Not-for-Profit-Sector in an attempt to evaluate the economic and non-economic contribution from a Northern Territory perspective. Employing impact mapping and analysing data from detailed focus group discussions with industry leaders and top managers, this paper identifies immediate, short term and long term impacts of activities of Not-for-Profit-Sector. In this process, several unintended measures were also identified which have, in the past, been ignored by earlier studies.

INTRODUCTION

This paper assesses the contribution of the Not for profit sector (NFPS) in the Northern Territory, Australia. NFPS is generally addressed by many different names such as “third sector”, “voluntary sector” and “social economy”. It is very diverse and boundaries defining the sector are fuzzy. They deliver services to their members, clients or to the community through operations in multiple fields, for example in welfare, education, sports, arts, culture and emergency services, building or maintaining community endowments such as biodiversity, cultural heritage and artistic creations, advocacy and/or political activities. Also, they are envisaged as organizations promoting redistribution, reciprocity and/or cooperative spirit.

This research paper aims to comprehensively measure the contribution of NFPS to the Northern Territory, Australia. More specifically, it determines appropriate measures to evaluate the sector's contribution to the Northern Territory. In order to conduct a thorough evaluation of NFPS, this project has been organized into three stages. They are as follows:

Stage I – Identification of variables to appropriately measure NFPS in the Northern Territory.

Stage II – Capturing value of NFPS.

Stage III – Impact assessment of NFPS in the Northern Territory.

This paper focuses on Stage I. It is therefore necessary to adopt a broad definition of NFPS as those comprising the following features:

Practice non-distribution of profits to members of the organization

A formal governance structure independent from government

Have an autonomy in decision-making and

primarily work through voluntary participation by members (Salamon and Anheier 1997; ABS 2012).

In addition to identification of variables to measure the contribution of NFPS to the Northern Territory, this paper also contributes to the development of a questionnaire to help determine economic and social value of the sector's contribution to the Northern Territory as required by latter stages.

LITERATURE REVIEW

Measuring the contribution of NFPS holistically has several challenges. These include:

- difficulty of measuring intangible contributions
- producing comparable results
- possibility that measurement may encourage organisations to focus on activities which are easier to measure rather than those which deliver the greatest social benefit and lastly
- expense of undertaking measurement.

To fully assess the contribution of the sector, measures should include economic, social, cultural and environmental costs and benefits accruing at the individual, group or broader community level.

These challenges emphasise the importance of developing a commonly agreed framework which:

- can be used, or adapted for use, by any organisation within the NFPS (including those that lack the resources to undertake comprehensive measurement or evaluation)
- is sufficiently rigorous to enable meaningful comparisons to be made between not only organisations within the sector, but also with organisations in other sectors.
- recognises that not all contributions may be quantifiable.

In responding to these challenges, a framework was needed that is flexible enough to acknowledge the diverse activities, organisational forms and unique contributions made by not for profit organizations. This research used Impact Mapping (IM) to determine the contribution (value) of NFPS in the Northern Territory. IM is a strategic planning technique which provides a logical structure through which the operational decisions of not for profit organizations can be traced to their outcomes. Input and output measures generally provide insights into activities which when aggregated provide scale and scope of the sector. Explicitly identifying links between the resources used by the sector, activities undertaken and the subsequent results of those activities (impact) would provide a reliable framework for measuring contribution of the not for profit sector.

METHODOLOGY

Interest in measuring the contribution of the not-for-profit sector has been prompted by the sector's increased share in economic activity and increasing appreciation of the social benefits it delivers. At the same time there is an increasing demand by Not for Profit Sector to measure its contribution in order to improve organisational performance and demonstrate the merit of their activities to philanthropic and government funders.

In 2005, Northern Territory Council of Social Service produced (NTCOSS) a series of fact sheets which described the sector in such ways as employment and volunteer numbers and compared the sector to other industries. These facts sheets were updated in 2011. While this information has been useful, it doesn't take the next step in researching the social and economic impact of the NGO sector in the NT.

Two focus groups were conducted to identify a comprehensive set of measures for conducting valuation of input, activities and output as per the impact mapping framework. Organisations were selected to attend the focus group sessions from an NGO list supplied by NTCOSS to CDU. Participants were from a board range

of organisations including AOD, disability, housing, legal and child and family sector. Large, medium and small organisations were also included along with indigenous and mainstream organisations and other peak bodies. While we were only able to run focus groups in Darwin, organisations with a reach across the NT were included.

A total of 21 managers and CEO's from various not for profit sector in the Northern Territory participated over two different sessions. These focus groups provided collective ideas for the improvement of existing measures and also helped in identifying missing variables. In addition, focus groups also provided insights into the not for profit sectors through in-depth conversations with relevant participants.

Impact Mapping of Not For Profit Sector

The aim of this stage of project is to identify a comprehensive set of measures for conducting valuation of NFPS. There were four distinct levels at which analysis for measuring contribution of NFPS was done as per Impact Mapping. They are:

Objectives-The first step of Impact Mapping is to determine primary and secondary objectives of an organization. This includes analysis of the vision and mission of the organization and determination of its key goals in service delivery.

Inputs-Information was sought on the processes by which activities are delivered and the types of resources used. Input based measures are a necessary initial step in the evaluation of contribution of the not for profit organizations in the sector.

Outputs-Outputs are defined as the intended results of not for profit activities. In the context of this study, outputs try to capture the full benefits to the recipient over and above the market evaluation. They may relate to behaviour, skills, knowledge, attitudes, values, condition, or other attributes as well (United Way of America, 1996, p. 2).

Impacts-Assessing impacts is the most important level in terms of measuring contribution. It encompasses the causal relationship between objectives, inputs and outputs. A proper assessment of impacts include determination of immediate, short term and long term consequences of investing inputs to generate outputs as per the objectives of the organization.

RESULTS

Each of the above levels was discussed at length at two focus groups. Results and their analysis are discussed below:

Objectives: After two focus group meetings, the following were identified as objectives of the Not for Profit Sector in the Northern Territory:

- Advocacy
- Policy Development / Monitoring
- Direct Services
- Education and Awareness
- Community Development
- Early Intervention / Prevention
- Sector Development

There was a consensus at the focus group that all identified objectives are important and should be accounted for when measuring the value of the NFPS. However, not all objectives were considered primary

for each organization. Hence two further tests were done to identify most important objective (categorical analysis) and to order identified objectives in terms of priority for NFPS (rank analysis).

Categorical Analysis

In addition to listing objectives, respondents were asked to split the above objectives into Primary, Secondary or Unrelated categories based on their individual organizations. This was done to get an understanding of the importance of each identified objective. Findings are plotted in the table 1.

Table 1: Categorical Analysis of Objectives

Objectives	Respondents							
	A	B	C	D	E	F	G	H
Advocacy	S	P	P	P	S	S	S	P
Policy Development/ Monitoring	S	P	P	S	S	S	S	P
Direct Services	P	P	Unrelated	P	P	P	P	Unrelated
Education and Awareness	S	P	S	P	P	P	P	S
Community Development	P	S	S	S	S	P	P	S
Early Intervention/Prevention	P	S	Unrelated	P	S	P	P	Unrelated
Sector Development	S	S	S	S	S	Unrelated	P	S

Legend: A-H: Respondents P: Primary Objective S: Secondary Objectives

Table 1 suggests that Direct Services and Education & Awareness were the two most important objectives. They were followed by Early Intervention/Prevention and Advocacy. Sector Development was the least prioritized objective by the two focus groups.

Rank Analysis

A confirmatory rank analysis was undertaken to identify the order of objectives based on their importance to the organization. Respondents were also asked to rank listed objectives based on their importance. Results are shown in Table 2.

Results were confirmed with Direct Services ranking at the top of list of objectives. Direct service delivery either to people outside the organisation (such as “social support for children, parents and wider community” or “emergency services”) or to members (this may include the “opportunity to participate in worship” through a religious organisation or the “benefits of providing education sessions” to train employees) was the primary objective of most organizations in the NFPS.

It is not surprising to note that sector development was the least favoured objective. Most organizations were more focussed on direct services with clients and saw sector development (including their own internal development) as a secondary objective.

Table 2: Rank Analysis of Objectives

Objectives	Respondents								Rank
	A	B	C	D	E	F	G	H	
Advocacy	5	2	2	4	3	5	6	2	4
Policy Development/ Monitoring	6	4	1	5	7	6	7	1	6
Direct Services	1	1	M	1	1	1	1	M	1
Education and Awareness	4	3	3	3	2	3	2	3	2
Community Development	3	6	4	6	4	4	3	5	5
Early Intervention/Prevention	2	5	M	2	5	2	4	M	3
Sector Development	7	7	5	7	6	7	5	4	7

Legend: M: Missing Information

Inputs: After two focus group meetings, the following were identified as key inputs (resources) of the Not for Profit Sector in the Northern Territory:

- Volunteers
- Government funding
- Independent funding/non-government funding
- Sales
- Donations
- Staff
- Assets & Equipment
- Intangible resources
- Networking (Informal)
- Partnership (Formal)
- Taxation Benefits

After agreeing upon the above input categories, respondents were asked to rank them on a Likert scale from 1 to 5 (1 = Most Important; 3 = Neutral; 5 = Not Important). Results are shown in Table 3.

Government Funding and Staff were identified as the two most important resources for Not for Profit Sector in the Northern Territory. Intangible resources (standard deviation: 0.535) came in next followed by informal networking.

Standard measures of input (resources) like Sales, Assets and Equipment and Independent Funding were a lot lower in rank. This confirmed a widely held view that NFPS is different in its resource base to other sectors of the economy and relies very heavily on Government and people who work for them.

Besides the inputs listed in Table 3, sector and corporate knowledge was one extra input suggested post focus group discussions. It doesn't appear as an individual item in Table 3 as it is possibly included within the input "Staff". However it is important to explicitly measure tacit or implicit knowledge within organizations combined with experience of staff members with respect to the pace of change of the sector. Hence sector knowledge is believed to be a crucial input variable in the evaluation of NFPS.

In the determination of the contributions of NFPS, all of the above inputs need to be assessed.

*Outputs-*After two focus group meetings, the following were identified as key outputs of the Not for Profit Sector in the Northern Territory:

- Counselling/ Mediation
- Case Management
- Training and Professional Development

Community Development/Capacity Building
 Accommodation
 Collaboration
 Advocacy
 Funding Administration
 Policy Development
 Governance

Table 3: Rank Analysis of Inputs

Inputs	n	Mean	Std. Dev.
Volunteers	8	2	1.31
Government Funding	8	1	0
Independent Funding/non-government Funding	8	2.63	1.19
Sales	8	2.75	1.58
Donations	8	3.50	1.07
Staff	8	1	0
Assets and Equipment	8	2.13	0.84
Intangible resources	8	1.50	0.54
Networking (Informal)	8	1.75	0.71
Partnership (Formal)	8	2.25	0.89
Taxation Benefits	8	2.00	1.31

The above outputs were agreed upon unanimously and no further analysis was required for identified outputs. Researchers felt that all of the identified outputs are equally important in the determination of the value of NFPS and hence ranking was not required.

Impacts-After two focus group meetings, the following were identified as key impacts of the Not for Profit Sector in the Northern Territory. Impacts were classified into the following two broad categories:

Internal impacts – It refers to the combined effect of objectives, inputs and outputs on the organization itself. Most organizations evolve over a period of time and they adapt their internal offerings, work processes and service delivery through interplay of three levels of impact mapping. It's important to take this into consideration when we are determining the value of NFPS as a whole.

External impacts- It refers to the influence of objectives, inputs and outputs on the environment in which the organization operates. As organizations evolve, they impact on their working environment, both positively and negatively through what they are trying to achieve. This is an important determinant in evaluating value of NFPS.

In addition to these two categories, impacts as reported by participants of the two focus groups were split into three time periods, namely – Immediate, Short Term (less than 12 months) and Long Term (more than 12 months).

Internal Impacts-Internal impacts are pictorially represented in Figure 1 and explained below in Table 4

Table 4: Immediate, short term and long term internal impacts

		Internal Impacts		
		Immediate (innermost circle)	Short term (centre circle)	Long Term (outermost circle)
Intended →		Improve management	Networking	
		Research development	More volunteer participation	
		Self-advocacy	Changing services to fulfil evolved expectations	
		Employee support	Strengthen organizational capacity	
Unintended →			Training staff	Better qualified staff throughout NT
			Make plans to reach new goals	
			Change in office time	

External Impacts- External impacts are pictorially represented in Figure 2 and explained below in Table 5

Figure 1 and 2 contains three concentric circles with the following descriptions:

The innermost circle represents “an immediate time period” which is usually defined from time zero to 6 months.

The centre circle represents “short term period” which is usually defined between 6 months and 1 year

The outermost circle represents “long term period” which is usually defined to be over 1 year.

An analysis of Figure 1 and 2 shows that organizations in NFPS of NT not only generated intended impacts from their objectives and outputs but also produced some unintended benefits. Internal and external impact generated from three levels of impact mapping shows considerable planned and unplanned changes in the organization (as listed in a tabular form in Table 4 and 5).

In order to measure the value of the NTFS in NT, it is important to accurately measure impact of organizations on the sector (external) and on organizations themselves (internal) in the sector. Internal and external impacts as captured through Table 4 & 5 and Figure 1& 2 is a major improvement on existing models of evaluation because it captures the dynamic nature of the impacts.

Questionnaire development should incorporate all elements of internal and external impact as identified. Measurement of the NFPS will be quantified for immediate and short term time periods and this will highlight the need for the unquantifiable long term policy impacts.

Figure 1: Immediate, Short Term and Long Term Internal Impacts of NFPS

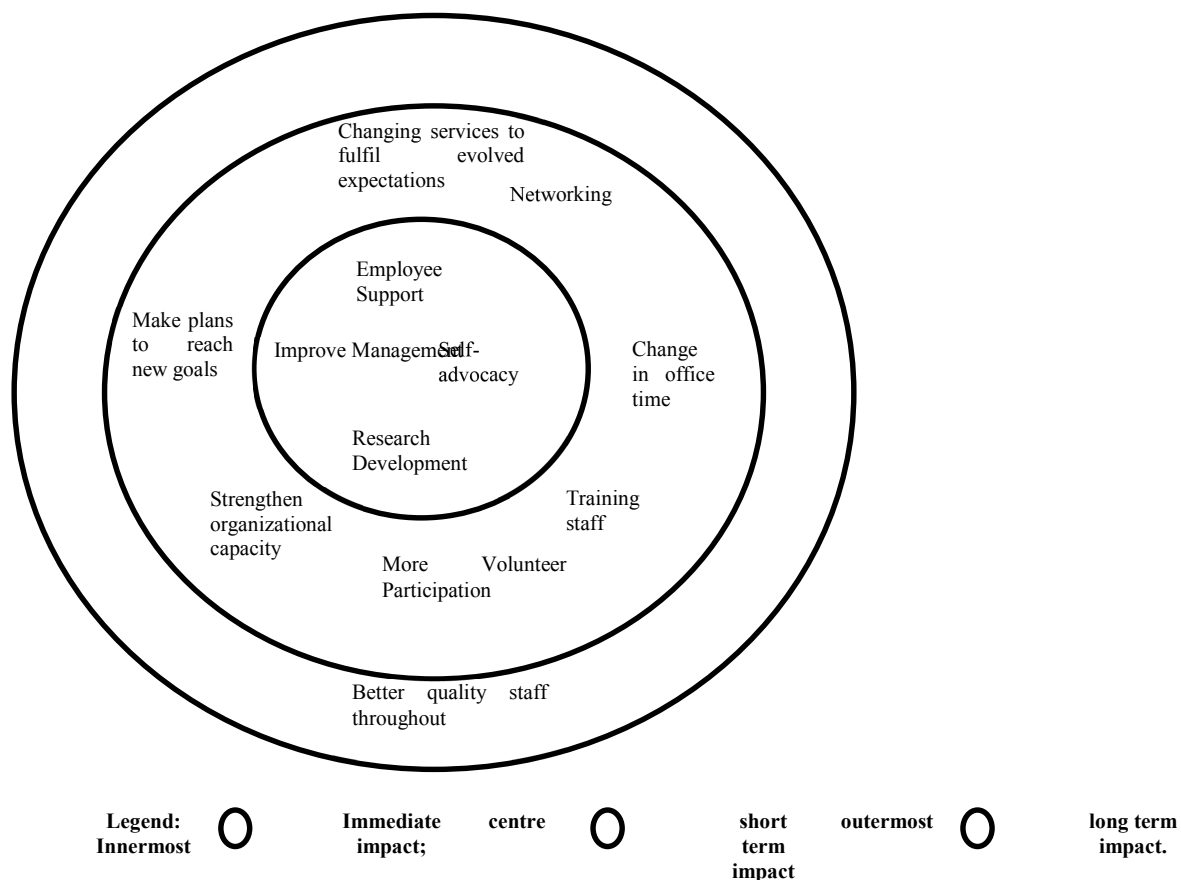

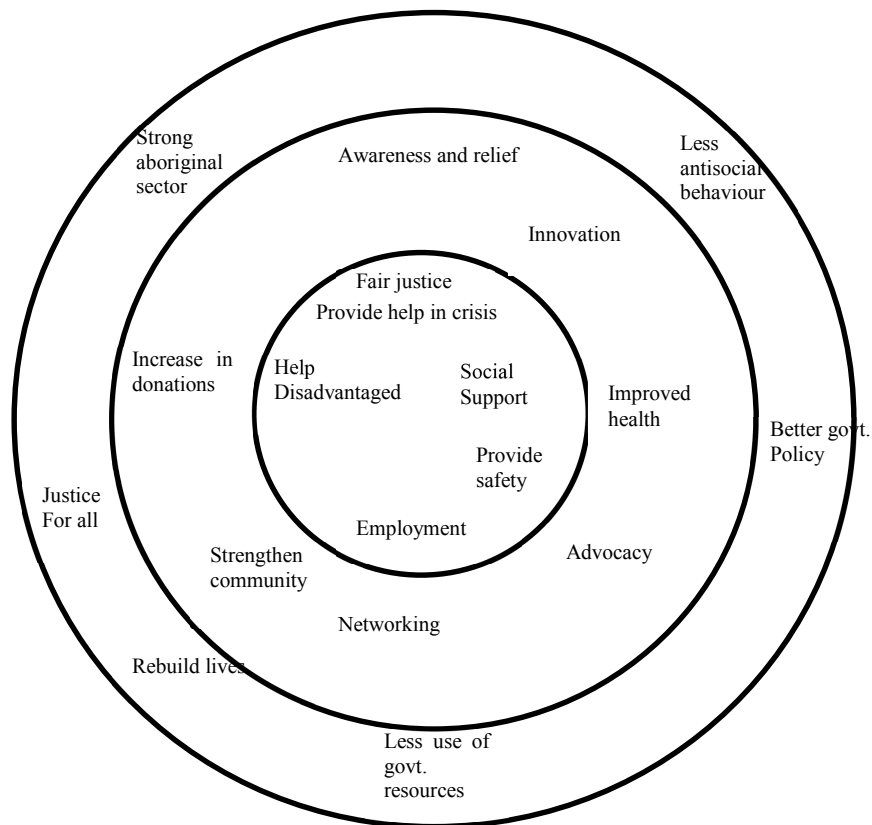

Table 5: Immediate, short term and long term external impacts

	External Impacts		
	Immediate (innermost circle)	Short term (centre circle)	Long Term (outermost circle)
Intended	Help disadvantaged Safety for children and women Provide accommodation Employment for community Education sessions for families, parenting and life skills Provide help in crisis	Awareness and relief Increase in donations Networking	Change of Perception Less use of Government resources Les anti-social behaviour Strong Aboriginal Sector Justice for all
Unintended	Fair Justice Social Support	Improved Health Strengthen community Innovation Advocacy	Better government policy Rebuild lives

Figure 2: Immediate, Short Term and Long Term External Impacts of NFPS

TOWARD AN INTEGRATIVE MODEL OF THE ADOPTION AND IMPLEMENTATION OF MANAGEMENT CONCEPTS

Dag Øivind Madsen, Buskerud and Vestfold University College

ABSTRACT

The adoption and implementation of management concepts has in recent years attracted much interest in management studies. Based on a synthesis of previous contributions, this paper aims to propose an integrative model of the adoption and implementation of management concepts. The model distinguishes between three key phases: (1) the pre-adoption phase, (2) the adoption phase, and (3) the post-adoption phase.

JEL: M10

KEYWORDS: Management Concepts, Adoption, Implementation

INTRODUCTION

The adoption and implementation of management concepts has in recent years attracted much interest among management scholars (e.g. Abrahamson 1991; Abrahamson 1996; Sturdy 2004). This interest has been sparked by observations of widespread adoption and diffusion of management concepts and ideas such as Total Quality Management, Knowledge Management, Corporate Social Responsibility and The Balanced Scorecard (Rigby and Bilodeau 2013; Røvik 2007; Van Hes and Verweel 2006). Researchers have focused on different issues related to adoption and implementation of management concepts. These issues range from how organizations and managers come into contact with new concepts and ideas (Madsen 2014a; van Rossem and van Veen 2011), the motives and rationales driving adoption decisions (Daniel, Myers and Dixon 2012; Sturdy 2004), to how concepts are implemented as practices in organizations (Røvik 2011). However, since the adoption and implementation of management concepts is still a relatively new research area, extant contributions are still somewhat fragmented and loosely connected. Hence, the purpose of this article is to synthesize current research in this area, and to propose an integrative model which takes into account the different phases in the adoption and implementation of management concepts. The paper is structured in the following way: The next section provides a brief overview and evaluation of the extant literature on the adoption and implementation of management concepts. Next, the integrative model is proposed and outlined. The paper ends with a conclusion and a discussion of limitations.

LITERATURE REVIEW

This section provides a brief overview and evaluation of the extant literature on adoption and implementation of management concepts. The section is divided into three parts, with each part covering one of the key phases in the adoption and implementation of a management concept: (1) the pre-adoption phase, (2) the adoption phase, and (3) the post-adoption phase.

The Pre-Adoption Phase

The pre-adoption phase can be defined as the phase where organizations are exposed to and become aware of new concepts. In other words, it is the phase preceding the adoption decision. The pre-adoption phase has received relatively little attention in previous research. To this point, van Veen, Bezemer and Karsten

(2011: 161) noted that “...hardly any theoretical and empirical work has been done on how managers get to know these concepts, and for what reasons they develop more or less interest in a specific concept (and not others)”. However, there are some exceptions (e.g. Alvarez, Mazza and Pedersen 2005; Madsen 2014a; Powell, Gammal and Simard 2005; van Rossem and van Veen 2011). For example, researchers have noted that before managers can make a decision about whether to adopt or reject a management concept, they have to become aware of, learn about, and develop an interest in the concept (van Rossem and van Veen 2011). Previous research has shown that the so-called ‘management fashion arena’ (Clark 2004b; Jung and Kieser 2012; Madsen and Slåtten 2013) plays an important role in the pre-adoption phase. Managers are exposed to new concepts and ideas as a result of interaction with a variety of fashion-setting actors, e.g. consultants, management gurus and conference organizers (Madsen 2014a).

For example, managers may be exposed to new concepts as a result of consuming management literature (Alvarez, Mazza and Pedersen 2005), contact with consultants (Heusinkveld and Benders 2012b; Jung and Kieser 2012), professional networks (Newell, Robertson and Swan 1998), software firms (Klincewicz 2006), direct contact with spokesmen (Powell, Gammal and Simard 2005) or current users (Madsen 2014a). Hence, managers encounter management concepts via different channels, networks and routes. Managers are not passive recipients in the pre-adoption phase, but actively seek out places where management concepts are presented and discussed (Madsen 2014a).

The Adoption Phase

The adoption phase is defined as the phase where an organization makes the decision whether to adopt or reject a management concept. In other words, this phase focuses rather narrowly on the adoption decision. In extant research the primary focus has been on explaining the motives and rationales driving adoption or rejection of management concepts. Researchers have aimed to obtain a window into the decision-making process of adopters, by exploring the driving forces behind adoption, the relative importance of economic and social pressures, and the role of internal and external agents (e.g. the management fashion arena) in influencing adoption decisions.

Traditionally, the adoption and diffusion of innovations was explained using primarily rational-choice arguments (Rogers 1995). However, the emergence of the sociologically inspired neo-institutional theory shifted the focus toward social and institutional explanations (DiMaggio and Powell 1983; Meyer and Rowan 1977). Drawing on elements from both neo-institutional theory and the literature on the diffusion of innovations, Abrahamson (1991) introduced the theory of management fads and fashions, which can be seen as a departure from conventional rational-choice explanations of adoption behavior. Abrahamson’s (1991) ‘fads and fashions’ framework can be used to analyze the motivations and rationales underlying the adoption or rejection of management concepts. Abrahamson separates between four perspectives: (1) efficient-choice, (2) forced-selection and (3) fad, and (4) fashion. The ‘efficient-choice’ perspective indicates that the organization adopts a concept because it is seen as useful for attaining the organization’s goals (e.g. correct a performance gap). The ‘forced-selection’ perspective indicates that the organization is coerced into adopting by an external actor (e.g. government agencies). The ‘fad’ perspective indicates that the organization is imitating the behavior of other organizations within its organizational field. Finally, the ‘fashion’ perspective involves the influence of external fashion-setting actors such as consultants or management gurus.

Hence, in Abrahamson’s (1991) framework both intra-organizational and extra-organizational pressures influence adoption decision-making. In addition, social and institutional pressures (e.g. fashion-setters and inter-organizational imitation) may be just as influential in driving adoption as efficiency-related pressures. In other words, Abrahamson takes into account the roles of (1) rational versus non-rational motives and (2) internal versus external influences in shaping adoption behavior.

In another important contribution, Sturdy (2004) distinguishes between six categories of motives driving the adoption of management concepts and ideas: (1) rational, (2) political, psychodynamic, (4) dramaturgical, (5) cultural, and (6) institutional. Sturdy considers both explicitly rational and various ‘semi-rational’ or irrational motives. Hence, Sturdy takes into account that organizations and managers may be influenced by various types of economic, cognitive, rhetorical, social, political, and cultural factors when making adoption decisions. These factors may stem from sources internal (e.g. psychological) or external (e.g. cultural and institutional) to the manager or organization.

In more recent contributions, researchers have looked more closely at how these motives and rationales shape actual adoption decisions in organizations. For example, Rautiainen (2009) finds that the rational versus non-rational dichotomy (the ‘polar view’) is too simplistic. Instead, Rautiainen (2009) finds that the motives are intertwined. In a similar vein, Daniel, Myers and Dixon (2012) applied Sturdy’s typology in the context of the adoption of management practices. These authors find ‘complex relationships’ between different motives and rationales. The motives and rationales work in interplay and are not mutually exclusive. For example, an adoption decision may partly be a rational response to an actual performance problem, but cultural factors may also be at play at the same time.

The Post-Adoption Phase

The post-adoption phase is defined as the phase subsequent to the adoption decision where organizations attempt to implement the concept as a practice. Røvik (2011) argues that this phase has received relatively little attention in previous research. Instead, adoption has been treated as a dichotomous variable, i.e. an either-or-decision. A consequence of this narrow focus on the adoption decision is that we know little about what happens to a management concept after it has been adopted by an organization (Ansari, Fiss and Zajac 2010; Røvik 2011). Røvik (2011) argues that researchers should focus more on what happens in the post-adoption phase, as organizations employ different types of ‘handling mechanisms’ when dealing with management concepts and ideas. This means that management concepts may have organization-specific trajectories (Heusinkveld and Benders 2012a). For example, while a concept may become institutionalized and have long-term impact on an organization, it can also become marginalized, stowed away, and lay dormant for a period of time (Røvik 2011). Understanding the post-adoption evolution and trajectory of management concepts is important as management concepts are not ‘wholesale products’ which are applied in an uniform way.

Instead, they are variable entities which are interpreted and understood in different ways. Many commentators have noted that management concepts have considerable ‘interpretive space’ (Benders and Van Veen 2001; Clark 2004a; Giroux 2006). Others have noted that management concepts may function as ‘boundary objects’ (Star and Griesemer 1989), meaning that they are malleable and plastic ideas which are mobilized vis-à-vis organization-specific issues, resulting in organization-specific translations (Hansen and Mouritsen 2005). Since management concepts tend to have both ‘interpretive space’ and ‘boundary concept’ characteristics, organizations interpret and use them in different ways (Madsen 2014b). Therefore, management concepts may have different trajectories both within an organization (Heusinkveld and Benders 2012a; Røvik 2011) and at the inter-organizational level, e.g. in a population of organizations (Madsen and Stenheim 2014).

Evaluation of Extant Research

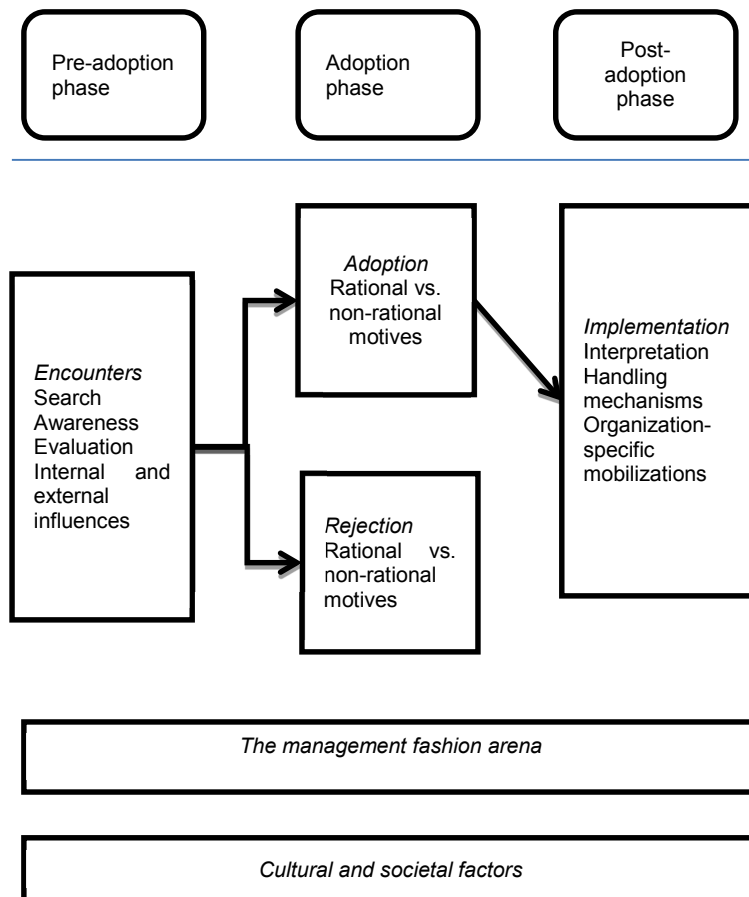

The review has shown that there is an emerging body of research on the adoption and implementation of management concepts. In particular, researchers have come a long way in terms of understanding the motives and rationales driving the adoption of management concepts, which in this paper is referred to as the adoption phase. However, considerably less attention has been devoted to the pre-adoption phase where

organizations are exposed to and learn about new concepts, and the post-adoption phase where concepts are interpreted, translated and implemented as practices in organizations.

Toward an Integrative Model

Based on a synthesis of the literature reviewed above, an integrative model is proposed (see Figure 1). The model takes into account that there are three key phases in the adoption and implementation of management concepts: (1) pre-adoption, (2) adoption, and (3) post-adoption.

Figure 1: Integrative Model of the Adoption and Implementation of Management Concepts

This model shows the three key phases in the adoption and implementation of management concepts.

The model shows that in the pre-adoption phase organizations and managers encounter management concepts as a result of interactions with actors from the management fashion arena (Madsen 2014a). As managers are exposed to new management concepts they have to make cognitive evaluations of the concept (van Rossem and van Veen 2011). Managers are only likely to adopt the concept if they perceive that the benefits outweigh the costs. Internal and external influences play important roles in this phase, as managers are influenced by actors within their own organization and extra-organizational actors such as consultants and spokesmen. Various cultural and societal factors also play a role, and managers are more likely to consider concepts which fit with local norms and cultural-cognitive frameworks (Perkmann and Spicer 2008) In the adoption phase organizations decide whether to adopt or reject the management concept. Both rational and non-rational motives may drive adoption or rejection (Abrahamson 1991; Sturdy 2004).

In this phase organizations are influenced by external factors such as the management fashion arena (Jung and Kieser 2012; Madsen and Slåtten 2013), and various types of cultural and societal factors which may shape adoption behavior (Sturdy 2004). Finally, in the post-adoption phase organizations have to interpret and 'handle' (Røvik 2011) management concepts with considerable 'interpretive space' and 'boundary object' characteristics. This may lead to organization-specific translations and mobilizations of the concept in practice (Hansen and Mouritsen 2005; Madsen 2014b). Organizations are influenced by fashion-setting actors in this phase, e.g. consultants who assist organizations with implementation (Heusinkveld and Benders 2012b). In addition, cultural and societal factors (e.g. local business culture) may shape how concepts are interpreted and translated.

CONCLUSIONS

The purpose of this paper was to synthesize current research and propose an integrative model which takes into account the different phases in the adoption and implementation of management concepts. The literature review showed that most of the research carried out to date has focused on the adoption phase. There is considerably less research on the pre-adoption phase. The same is to a certain extent true of the post-adoption phase. However, it appears that the post-adoption phase is getting more attention in current research, as it is becoming widely recognized that management concepts are interpreted and applied in diverging ways. The model proposed in this paper has several limitations. Since the adoption and implementation of management concepts and ideas is still a relatively new research area, not all phases are well understood. As noted, there is still relatively little research on the pre-adoption and post-adoption phases, as well as limited evidence on the role that external factors (e.g. culture and society) play in these processes. Hence, the model is only a starting point and should be revised taking into account emerging developments in this research area.

TAXATION AND THE NIGERIAN ECONOMY: (1994-2012)

Emmanuel Ezeji Chigbu, Federal University of Technology
Charles Odinakachi Njoku, Federal University of Technology

ABSTRACT

The study investigates the impact of taxation on the Nigeria economy for the period 1994 -2012. The dependent variables used in the model includes: gross domestic product (GDP) as a parameter for measuring economic growth, inflation and unemployment. The objective is this study is to determine how taxation affects these macroeconomic variables. To avoid spurious results, the data set collected from the central bank of Nigeria statistical bulletin and federal inland revenue services was subjected to augmented dickey fuller unit root test, which reveals that the variables are stationary. The cointegration test also reveals that the variables are cointegrated and long run relationships exist between the variables. The results of the statistical analysis reveal that positive relationships exist between the explanatory variables (custom and excise duties, company income tax, personal income tax, petroleum profit tax and value added tax) and the dependent variables (gross domestic product, unemployment). But, the individual explanatory variables have not significantly contributed to the growth of the economy; also the explanatory variables have not significantly contributed to the reduction of the high rate unemployment and inflation in Nigeria for the period under review. Study recommends total restructuring of the tax system in the country and the provision of basic amenities (good roads, steady power supply, internal security, etc) which will encourage individuals and corporate organizations to honor their tax obligations in Nigeria.

JEL: H20, O10, E24

KEYWORDS: Economic Growth, Unemployment, Taxation, Inflation, Economic Development.

INTRODUCTION

The primary aim of taxation is usually to generate revenue capable of financing government expenditure at all levels of government. The importance of taxation to any government cannot be over emphasized. Chigbu, et al (2012) explained that Taxes are levied on individuals, groups, business or corporate bodies, by constituted authorities for funds used by state in the maintenance of peace, security, economic growth and development and social engineering for the benefit of the citizenry. Taxation as a major source of revenue has made it so important for researchers to establish a link between taxation and economic growth of the country.

This research work examines the link between taxation and economic development in Nigeria for the period 1994 to 2012. It investigates how the value added tax introduced in the country in May 1993 and other types of taxation in operation in Nigeria like the personal income tax, petroleum income tax, company income tax custom and excise duties have affected the Nigerian economy. Attempts will be made to evaluate their impacts on the Gross Domestic Product, inflation and unemployment in the country. Government increases tax during recession period and decreases tax during economic boom. Taxation is also used to promote other objectives like equity, close the gap between the rich and the poor and to address social and economic concerns. Taxation as a fiscal policy instruments affects the macro economic variables of the economy, as it affects the level of aggregate demand in the economy, it affects income distribution thereby reduces the gap between the rich and the poor in the country. Taxation reduces the purchasing power of individuals thereby serving as an inflationary measure. Anyafo (1996) also affirms that a good tax system should be able to stimulate employment, control inflation and enhance economic growth. Tax

is also used as a measure to discourage the consumption of those goods and services considered to be harmful or non essential commodities.

Appah (2004) defined tax as a compulsory levy imposed on a subject or upon his property by the government to provide security, social amenities and create conditions for the economic well-being of the society. In his own view, Bhartia (2009) argues that a tax is a compulsory levy payable by an economic unit to the government without any corresponding entitlement to receive a definite and direct quid pro quo from the government. Wikipedia defined tax as a financial charge or other levy imposed upon a taxpayer (an individual or legal entity) by a state or the functional equivalent of a state such that failure to pay is punishable by law.

Anyafu (1996), defined taxation as a compulsory payment by individuals and organizations to the relevant inland or internal revenue authorities at the federal, state and local government levels. All the definitions of tax center on the fact that it is a major source of revenue that finances government expenditure at all levels. It is believed that the tax system of a nation determines who bears the burden of payment and how the tax collected should be spent. Anyafu (1996) maintained that a good tax system should be able to stimulate employment and enhance economic growth in the country. However, the use of tax as an instrument of fiscal policy to achieve economic growth in most developing countries like Nigeria cannot be reliable because of dwindling level of revenue generation and the country's mono dependence on oil revenue.

According to Engen and Skinner (1996), a number of recent theoretical studies have used endogenous growth models to stimulate the effects of a fundamental tax reform on economic growth. These studies conclude that reducing the distorting effects of the current tax structure would permanently increase growth. Advocates of tax cuts claim that a reduction in the tax rate will lead to increased economic growth and prosperity. Others claim that if we reduce taxes, almost all of the benefits will go to the rich, as those are the ones who pay the most taxes.

Gustavo, et al (2013) opined that an understanding of the public policies that can be effective in improving economic growth performance is critically an important issue at the national and international levels. The general well-being of the population and reduction in poverty level are related to economic growth and development. And the issue of potential growth is at the heart of recent discussions on stabilization policy. Different public policies are being applied to boost growth and to reduce poverty in different regions of the world, but fiscal policies have become the most common and relevant instruments in the heart of policy-makers (Tanzi and Zee, 1997).

United Nations (2005) suggests that, to achieve the Millennium Development Goals (MDGs), low-income countries (LICs) are required to increase their domestic revenues by around 4 percent of the GDP. To meet the MDGs, OECD countries have been urged to raise their level of aid to LICs to about 0.7 percent of their Gross National Income, but this can't be compared with potential tax revenues (Worlu and Nkoro 2012). The infrastructural developments demand a lot of resources and funding. In many rich countries, tax constitutes 30-40 percent of the GDP (Golit, 2008 and TJN, 2012).

Despite the revenue generated from tax at all levels of government in Nigeria, the majority of the population still wallow in abject poverty, majority of the population live below (\$1) one US Dollar per day. The gap between the rich and the widens day by day. The country is still ranked among the economically less advanced states. Again, unemployment is one of the macro economic problems facing the country. This problem increases day by day. Consider the recent failed employment test conducted by the Nigeria Immigration Service (NIS), where over twenty unemployed youths lost their lives in their attempt to partake in the employment test in various states of the country. Over 6.5m Nigerians applied for 4500 vacant positions in the Nigeria Immigration Service.

Objectives of The Study

The main of this study is to examine how the various types of tax in operation in Nigeria have affected economic growth of Nigeria (using GDP as a proxy for economic growth) from 1994 to 2012. Other objectives include to examine the effect of taxation on inflation in Nigeria and to determine the effect of taxation on unemployment in Nigeria.

LITERATURE REVIEW

According to Chigbu (2012) for the government to achieve macroeconomic objectives of price stability, full employment, external balance and sustainable economic growth and development in the long run, the government must have sound fiscal and monetary policy instruments in place. Taxation and government expenditure are the fiscal policy instruments of the government while the monetary policy instruments include: reserve requirements, discount rates and open market operations. This study focuses on taxation as a fiscal policy instrument and how it affects the economy. This section reviews the related literature necessary to explain the relationship between taxation and economic development.

Custom and Excise Duties (CED)

These are the oldest forms of indirect tax which dated back to the 19th century. Custom duties are commodity taxes imports and exports. According to Ayodele (2006), custom duties are the highest yielding indirect tax. The tax is administered by the Nigerian Custom Services (NCS). It is believed that duties on imports are against the principle of comparative cost thereby restricts the full development of international trade. Import duties are also used in protecting infant industries in the country. The burden of export duties are passed on to the foreign country in form of increased prices. The burden of import duties fall on the consumers of the goods and services that it is levied on.

Excise duties are commodity taxes levied on goods manufactured within the country. This indirect tax does not only serve the purpose of raising revenue for the country but also to discourage the consumption of certain goods (Fasoranti 2013). Who bears the burden of excise duties depend on the type of commodity taxed. Excise duty on luxuries is borne by the rich, while excise duty on necessities is borne by the poorer people (Anyafu 1996).

Company Income Tax (CIT)

This is also known as company profit tax or corporation tax. Company income tax is a tax on the profit made by companies. It was introduced in Nigeria in 1961 and administered by the Federal Internal Revenue Services. Since enactment, the law on CIT has passed through series of amendment. The rate of CIT varies according to operation and size of turnover per annum. According to Onaolapo, et al(2013), Companies condemn this Company taxes on profit as it is seen as a penalty for success without compensation for failure. Company taxes are designed to collect revenue from firm's economic profit. The tax is on the net accounting profit: gross profit less administrating, operating and interest expenses. The revenue from company income tax has been low due to tax concessions, rebates and tax holidays allowed to newly established companies. Tax evasion and tax avoidance are also responsible for this low yield (Ebiringa and Emeh 2012).

Petroleum Profit Tax (PPT)

This is a tax levied on the profit of oil companies. According to Akintoye and Tashie (2013), Petroleum profit tax is singled out because of the significance of oil in the Nigerian public revenue performance. The petroleum profit tax act 1959 no 15 imposes with effect from January 1st 1959, a tax on the profits from

the mining of petroleum in Nigeria. This is to take care of economic rent on the land used for mining. The PPT is applicable to upstream operation in the oil sector i.e. production of crude oil and gas and sale of these as primary products to downstream operations (Ayodele, 2006). It is the most important tax in Nigeria in terms of its share of 95% of government revenue and 70% of total foreign exchange earnings. The major problem of this source of revenue is the fluctuation resulting from price fluctuation of crude oil process in the world market. The operation of the petroleum profits tax was extended to the companies engaged in liquefied natural gas operations under PPT amendment no.3 Decree 1979 No 95.

Personal Income Tax (PIT)

According to Akintoye and Tashie (2013), Personal income tax is tax paid on one's personal income as distinct from the tax paid on the firm's earnings. In an incorporated firm, the owners (shareholders) pay taxes on both their income (salary or dividend from the firm) firm's income (profits). In partnerships and sole-ownerships, the tax is paid only once on the firm's profits. Personal Income Tax Rate in Nigeria is reported by the Federal Inland Revenue Service, Nigeria. The Personal Income Tax is a tax collected from individuals and is imposed on different sources of income like labor, pensions, interest and dividends. Revenues from the Personal Income Tax Rate are an important source of income for the government of Nigeria (Anyafu 1996).

Empirical Review

Adereti , et al (2011), in their study on Value added tax and economic growth in Nigeria, using the regression model revealed that a strong positive relationship exists between value added tax and economic growth in Nigeria within the period under review (1994-2008). Onaolapo et al (2013) investigated the Effect of Petroleum Profit Tax on Nigerian economy, the study covered the period between 1970 and 2010. Their study revealed that Income from a nation's natural resource has a positive influence on economic growth and development. They recommended that Government should transparently and judiciously account for the revenue it generates through PPT by investing in the provision of infrastructure and public goods and services. Chigbu et al (2012) in the empirical study on economic growth and taxation using the Granger Causality approach concluded that taxation is a very important instrument of fiscal policy that contributes to economic growth of any country.

Anyanwu (1997) in his study of the effects of taxes on Nigeria Economic Growth (1981-1996) reveal that companies' income tax positively and significantly affects GDP, also customs and excise duties significantly affects economic growth in Nigeria. While petroleum profit tax positively and insignificantly affects Nigeria's GDP. The same is true of other direct taxes (capital gains and stamp duties). However, all direct taxes positively and significantly affect Nigeria's GDP.

Ergete & Dahlby (2012), in their study "The Impact of Tax Cuts on Economic Growth: Evidence from the Canadian Provinces" revealed that a negative relationship exist between taxation and economic growth in Canada. The finding concludes that reducing corporate income tax 1 percentage point raises annual growth by 0.1 to 0.2 points. Jens Arnold et al (2011) based their research on 21 countries and their findings reveal that Corporate taxes most harmful to economic growth, followed by taxes on personal income, consumption, and property. Progressivity of PIT harms growth. A 1 percent shift of tax revenues from income taxes (both personal and corporate) to consumption and property taxes would increase GDP per capita by between 0.25 percent and 1 percent in the long run. Corporate taxes, both in terms of the statutory rate and depreciation allowances, reduce investment and productivity growth. Raising the top marginal rate on personal income reduces productivity growth. Karel and Ravn (2012) studied the exogenous changes in personal and corporate income taxes and how they affect USA economy. The study revealed a negative relationship existing between the dependent variable and the explanatory variables. They concluded that A 1 percentage point cut in the average personal income tax rate raises real GDP per capita by 1.4 percent in

the first quarter and by up to 1.8 percent after three quarters. A 1 percentage point cut in the average corporate income tax rate raises real GDP per capita by 0.4 percent in the first quarter and by 0.6 percent after one year.

To the best of our knowledge we are not aware of any study yet on the effect of taxation on these macroeconomic economic variables: economic growth, inflation and unemployment in Nigeria. This research work seeks to fill this gap in our study.

RESEARCH METHODOLOGY

This study makes use of time series data sourced from the CBN statistical Bulletin, Economic and Financial Review and Annual Reports and Statement of Accounts of the Central Bank of Nigeria (CBN), the Federal Office of Statistics (FOS) and the Federal Inland Revenue Services Statistics. The macroeconomic data cover gross domestic product (GDP), unemployment and inflation as the dependent variables and Company Income tax, Petroleum profit tax, Value added tax, Custom and Excise Duties and Personal income tax as the explanatory variable for the period 1994 -2012 in Nigeria.

Model specification :All data collection for the purpose of the study were evaluated, cross checked, compared and critically analyzed.

To explain the relationship between taxation and economic growth in Nigeria, the model is specified below:

$$\begin{aligned} \text{GDP} &= f(\text{PIT}, \text{VAT}, \text{PPT}, \text{CED} \text{ and } \text{CIT}) && \text{(i)} \\ \text{GDP} &= B_0 + B_1 \text{CED}_t + B_2 \text{CIT}_t + B_3 \text{PIT}_t + B_4 \text{PPT}_t + B_5 \text{VAT}_t + U_t && \text{(ii)} \end{aligned}$$

The a priori expectation is $B_1, B_2, B_3, B_4, B_5 > 0$

To explain the relationship between taxation and Unemployment in Nigeria, the model is specified below:

$$\begin{aligned} \text{UNP} &= f(\text{PIT}, \text{VAT}, \text{PPT}, \text{CED} \text{ and } \text{CIT}) && \text{(iii)} \\ \text{UNP} &= B_0 + B_1 \text{CED}_t + B_2 \text{CIT}_t + B_3 \text{PIT}_t + B_4 \text{PPT}_t + B_5 \text{VAT}_t + U_t && \text{(iv)} \end{aligned}$$

The a priori expectation is $B_1, B_2, B_3, B_4, B_5 < 0$

For the relationship between taxation and inflation, the model is specified below:

$$\begin{aligned} \text{INF} &= f(\text{PIT}, \text{VAT}, \text{PPT}, \text{CED} \text{ and } \text{CIT}) && \text{v} \\ \text{INF} &= B_0 + B_1 \text{CED}_t + B_2 \text{CIT}_t + B_3 \text{PIT}_t + B_4 \text{PPT}_t + B_5 \text{VAT}_t + U_t && \text{(vi)} \end{aligned}$$

The a priori expectation is $B_1, B_2, B_3, B_4, B_5 < 0$

Where; GDP = Gross Domestic Product

INF= Inflation Rate

UNP= Unemployment Rate

PIT= Personal Income Tax

VAT= Value Added Tax

PPT= Petroleum Profit Tax

CED= Custom and Excise Duties

CIT= Company Income Tax

B_0 = Intercept of the relationship

B_1, B_2, B_3, B_4 and B_5 = Measure of the slope

U = Error term/stochastic variable.

Test for Stationarity: To avoid spurious regressions which may arise as a result of carrying out regressions on time series data, we first subject the data to stationarity test by using the Augmented Dicker Fuller(ADF) tests.

The ADF test was done with the following hypothesis:

H0: Variable contains unit root and hence is non-stationary.

H1: Variable does not contain unit root and hence is stationary

The decision rule was that: If the calculated ADF Test statistic is greater than the MacKinnon critical values, reject the null hypothesis of non-stationarity and accept the alternative of stationarity, otherwise accept the null hypothesis of non stationarity.

Co-Integration Tests: Theoretically, it is expected that a regression involving non-stationary time series may produce spurious results. Co-integration tests prove that the combination of stationary and non-stationary variables has a long-term relationship. In this study the Johansen Test for Co-integration test on the residuals were used.

PRESENTATION AND INTERPRETATION OF RESULTS

Empirical findings are discussed under the following sub-sections: result of the stationarity (unit root), Johansen Co-integration test, regression result. The result of the Stationarity (unit root) test using the Augmented Dicky-Fuller Test is summarized below:

Table 4.1: Result of Stationarity (Unit Root) Test:

VARIABLES	ADF-STATISTIC	CRITICAL VALUES @ 5%	ORDER OF INTEGRATION
CED	-5.319475	-3.052169	Stationary at first difference
CIT	-5.393648	-3.065585	Stationary at second difference
PIT	-6.057888	-3.081002	Stationary at level
PPT	-4.212838	-3.052169	Stationary at first difference
VAT	-4.977828	-3.081002	Stationary at second difference
GDP	-3.408241	-1.964418	Stationary at first difference
INF	-5.884434	-3.081002	Stationary at level
UNP	-5.042325	-3.052169	Stationary at first difference

The Table shows the result of the Unit Root Test

Table 4.2: Johanson Co-Integration Test Result (Dependent Variable: GDP)

Hypothesized No. of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical Value	Prob.**
None *	0.999710	138.4981	33.87687	0.0000
At most 1 *	0.866420	34.22191	27.58434	0.0061
At most 2*	0.696616	25.86048	21.13162	0.0331
At most 3 *	0.577436	14.64406	14.26460	0.0435
At most 4 *	0.274474	5.454601	3.841466	0.0195

The result of the Augmented Dicker Fuller (ADF) unit root test for stationarity indicates that PIT and INF variables are stationary at level, CED, PPT, GDP and UNP are stationary at first difference while CIT and VAT are stationary at second difference. Therefore, study rejects the null hypothesis and concludes that there is no unit root in the variables.

Table 4.3: Johanson Co-integration Test Result (Dependent Variable: Inflation)

Hypothesized No. of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical Value	Prob.**
None *	0.999829	211.5801	69.81889	0.0000
At most 1 *	0.858117	64.17377	47.85613	0.0007
At most 2 *	0.651386	30.97694	29.79707	0.0364
At most 3	0.516575	13.06253	15.49471	0.1125
At most 4	0.040675	0.705925	3.841466	0.4008

Table 4.4: Johanson Co-Integration Test Result (Dependent Variable: Unemployment)

Hypothesized No. of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical Value	Prob.**
None *	0.999490	224.4828	69.81889	0.0000
At most 1 *	0.983105	95.59128	47.85613	0.0000
At most 2	0.612094	26.21887	29.79707	0.1223
At most 3	0.443207	10.12001	15.49471	0.2716
At most 4	0.009687	0.165475	3.841466	0.6842

The cointegration test result in table 4.2 above shows that there are at most five cointegrating equations in the model, in table 4.3 above the result indicates that there are at most three cointegrating equations in the model, while table 4.4 shows that there are at most two cointegrating equations in the model. These results show that there exists a long run equilibrium relationship between the dependent variables and the explanatory variables, allowing us to conclude that the variables are cointegrated.

Regression Results

Table: 4.5. Least Square Result. Dependent Variable: GDP

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-3849963.	6688549.	-0.575605	0.5747
CED	41212.20	121370.4	8.339557	0.0096
CIT	-83831.50	509379.3	-0.164576	0.8718
PIT	-0.368572	0.822064	-0.448350	0.6613
PPT	-3.347833	104.0264	-0.032183	0.9748
VAT	47.94912	60.86303	6.787820	0.0049
R-squared	0.620213			
Adjusted R-squared	0.474141			
F-statistic	4.245939	Durbin-Watson stat		1.943918
Prob(F-statistic)	0.016497			

From table 4.5 above, the equation is estimated below:

$$\text{GDP} = -3849963 + 41212.20\text{CED}_t - 83831.50\text{CIT}_t - 0.367\text{PIT}_t - 3.348\text{PPT}_t + 47.949\text{VAT}_t$$

In table 4.5 above, the negative intercept of B0 in the equation above, indicated that when the independent variables explained in the model are zero, Gross Domestic product is expected to be -N3,849,963m. From the result also, Custom and Excise duties, and Value added tax met the apriori expectation of the model, they increases the Gross Domestic Product. While Company Income tax, Personal Income tax and Petroleum Profit tax did not meet the apriori expectation of the model so, they reduce the Gross Domestic Product.

Table: 4.6. Least Square Result. Dependent Variable: Unemployment

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	35171.40	36446.28	0.965020	0.3521
CED	-272.8958	661.3541	-0.412632	0.6866
CIT	5220.776	2775.636	1.880929	0.0826
PIT	0.003864	0.004479	0.862658	0.4040
PPT	0.019538	0.566846	0.034469	0.9730
VAT	0.115223	0.331646	0.347429	0.7338
R-squared	0.934086			
Adjusted R-squared	0.908735			
F-statistic	36.84562	Durbin-Watson stat		2.137544
Prob(F-statistic)	0.000000			

From table 4.6 above, the model equation is estimated below:

$$UNP = 35171.40 - 272.9CED_t + 5220.78CIT_t + 0.00364PIT_t + 0.0195PPT_t + 0.11522VAT_t$$

The positive intercept of B0 in the equation above indicates that when the independent variables are zero, Unemployment is expected to be 35171.40 units. Only Custom and Excise Duties met the apriori expectation, while Value Added Tax, Company Income Tax, Petroleum Profit Tax and Personal Income Tax did not meet the apriori expectation.

Table: 4.7. Least Square Result. Dependent Variable: Inflation.

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-14084.84	32165.87	-0.437881	0.6687
CIT	0.977762	0.500273	1.954458	0.0725
VAT	0.408866	0.292696	1.396896	0.1858
PPT	149.2390	583.6817	0.255686	0.8022
PIT	-0.004535	0.003953	-1.147148	0.2720
CED	-2284.905	2449.653	-0.932746	0.3680
R-squared	0.988558			
Adjusted R-squared	0.984157			
F-statistic	224.6286	Durbin-Watson stat		1.635406
Prob(F-statistic)	0.000000			

$$INF = -14084.84 - 2284.905CED_t + 0.97776CIT_t - 0.00454PIT_t + 149.24PPT_t + 0.40887VAT_t$$

In table 4.7 above, the negative intercept of B0 in table 4.7 above, indicates that when the independent variables are zero, Inflation rate is -14084.84units. Custom and Excise Duties (CED) and Personal Income

Tax (PIT) met the apriori expectation, while Company income tax, Value Added Tax and Petroleum Profit Tax did not meet the apriori expectation.

Discussion of Results

Durbin Watson Stat. values of 1.94, 2.14 and 1.64 in tables 4.5, 4.6 and 4.7 respectively, illustrate the absence of auto-correlation.

In table 4.5 above, the coefficient of determination (R^2) from our results is given as 0.62. This implies that 62% of the variations in the growth rate of the GDP of Nigeria are accounted for by the included explanatory variables of Custom and excise Duties, Company Income Tax, Personal Income Tax, Petroleum Profit Tax and Value Added Tax. The adjusted coefficient of determination (adjusted R^2) is given as 0.4741. This means that precisely 47.41% of the variations in the growth rate of the Gross Domestic Product of Nigeria are accounted for by the included variables, after the co-efficient of determination has been adjusted to make it insensitive to the number of included variables. The statistical test for significance of the individual parameter estimates (i.e t-statistic) using 95% confidence interval indicates that only Value Added Tax T.stat. 6.788 (Prob.0.0049) and Custom and Excise duties (t. stat. 8.3396 Prob. 0.0096) are statistically significant in explaining the changes in economic growth in Nigeria, at 5% level of significance, while other variables (Company Income tax, Personal Income Tax and Petroleum Profit Tax) are not statistically significant and have not significantly contributed to economic growth in Nigeria for the period under review.

In table 4.6 above, the coefficient of determination (R^2) with 0.93 values, implies that 93% of the variations in Unemployment in the country are accounted for by the included explanatory variables of Custom and excise Duties, Company Income Tax, Personal Income Tax, Petroleum Profit Tax and Value Added Tax. The adjusted coefficient of determination (adjusted R^2) value of 0.91, means that 91% of the variations in Unemployment in Nigeria are accounted for by the included explanatory variables, after the co-efficient of determination has been adjusted to make it insensitive to the number of included variable. The t. stat. test for the significance of the individual included explanatory variables indicate that all the included explanatory variables (Custom and Excise Duties, Company Income Tax, Personal Income Tax, Petroleum Profit Tax and Value Added Tax) are not statistically significant in explaining the variations in the dependent variable. These explanatory variables have not significantly contributed in reducing the rate of unemployment in Nigeria.

Table 4.7 above reveals the coefficient of determinant (R^2) as 0.99, meaning that 99% of the variations in Inflation in Nigeria are accounted for by the explanatory variables included in the model. So 99% relationship exists between the dependent variable (inflation) and the independent variables (Custom and Excise Duties, Company Income Tax, Personal Income Tax, Petroleum Profit Tax and Value Added Tax). The adjusted coefficient of determination (adjusted R^2) is given as 0.9842. This means that precisely 98.42% of the variations in the growth rate of the Gross Domestic Product of Nigeria are accounted for by the included variables, after the co-efficient of determination has been adjusted to make it insensitive to the number of included variables. The t. stat. test for the significance of the individual explanatory variables at 5% significance level, reveals that Custom and Excise Duties (T. stat. -0.932746 Prob.0.3680), Company Income Tax (T. Stat. 1.954458 Prob. 0.725) , Personal Income Tax (T. Stat. -1.147148 Prob. 0.2720) , Petroleum Profit Tax (T. Stat. 0.2557 Prob.0.802) and Value Added Tax (T. Stat.1.3969 Prob. 0.186) are not statistically insignificant in explaining the variations in the model.

CONCLUSION AND RECOMMENDATION

The purpose of this study is to examine the impact taxation on economic growth, Inflation and Unemployment in Nigeria using the time series data for the period 1994 to 2012. In other to achieve this,

three econometric models were developed and analyzed using Eviews statistical package version 7.2. The results of the analysis reveal that in the first model, value added tax and custom and excise duties are statistically significant and have significantly contributed to economic growth in Nigeria while Personal income tax, company income tax, petroleum profit tax are not statistically significant and have not significantly contributed to economic growth in Nigeria.

The results of the analysis also indicate that the explanatory variables (Custom and excise duties, company income tax, personal income tax, petroleum profit tax and value added tax) have no significant effect on both unemployment and inflation in Nigeria. Therefore research concludes that taxation in Nigeria have not significantly impacted on economic growth, unemployment and inflation. This research is in live with the views of Karel and Ravn (2012) and Jens Arnold et al (2011). Based on these findings, study recommends the following:

Government should ensure that taxation is properly managed in a manner that will accelerate economic growth, reduce inflation rate and generate employment in the country. There is also need for the Nigeria government to restructure the tax system to meet the demands of the 21st century. There should be adequate provision of infrastructures and basic amenities like: electricity good water good roads etc as this will enhance people's compliance in tax payment.

EDUCATIONAL MANAGEMENT ADMINISTRATION & LEADERSHIP: WORKPLACE PREDICTORS OF U.S. SECONDARY SCHOOL TEACHERS' INTENT TO LEAVE

Sukkyung You, Hankuk University of Foreign Studies, Seoul, Korea

ABSTRACT

The subject of teachers' intentions to leave has recently captured the attention of researchers and practitioners. This paper reports on a study that examined the workplace predictors of teachers' intentions to leave for teachers in different career stages. Structural equation modeling was used to assess the plausibility of a conceptual model specifying hypothesized linkages among secondary school teachers' perceptions of workplace predictors, satisfaction and commitment, and teachers' intent to leave. Using the USA Schools and Staffing Survey (SASS) data set, two mediational models were tested, one reflecting partial mediation and the second representing full mediation. Results indicated that the workplace variables had significant meaningful indirect effects on teachers' intent to leave through three mediators: job satisfaction, work commitment, and career commitment. Furthermore, the effect of administrative support on work and career commitment was uniform and significant for teachers in the three career groups. Some differences across the three teacher career groups were discussed.

KEYWORDS: Administration, Teachers, U.S., Intent to leave, Career stages

INTRODUCTION.

Using the Schools and Staffing Survey (SASS) data set, this study sought to examine teachers' intentions to leave in three career groups/stages: novice, mid-career, and veteran. It specifically sought to examine whether particular workplace conditions (e.g., administrative support, teacher autonomy/discretion, and student disengagement) were predictive of teacher turnover for secondary school teachers in these career groupings. Therefore, the research questions to be answered in the study were:

Which dimensions of perceived workplace conditions for secondary school teachers (e.g., administrative support, teacher autonomy/discretion, and student disengagement) have significant direct and/or indirect effects on teachers' intent to leave? Are there group differences that exist across three career groups (i.e., novice, mid-career, and veteran)?

Do teachers' mediating or intervening variables (i.e., work commitment, career commitment, and job satisfaction) serve as important mediators between workplace conditions dimension(s) and teachers' intent to leave? Are there group differences that exist across three career groups (i.e., novice, mid-career, and veteran)?

METHOD

The main question addressed in this study involves ascertaining the effects of different workplace condition variables on teachers' intent to leave among secondary school teachers who are in different career stages. The method section is divided into four parts. Firstly, the sample choice is outlined and demographic information is provided about the samples. Secondly, the dependent variables (outcome variable and

mediating variables) are discussed. Thirdly, a factor analysis is utilized to identify the independent variables. Finally, the fourth section presents the plan for analysis and hypothesized mediation models to be tested.

Sample

The data for this research came from the National Center for Education Statistics (NCES) national database of teachers included in the 2007–2008 SASS database. The SASS collects information about elementary and secondary schools and the staff who work in them. SASS is a coordinated set of questionnaires sent to a random sample of public and private schools, their principals, a subset of the teachers, school library staff, and the public schools' districts. In selecting our sample, we refined the original data set, selected an initial sample, and then selected a sub-sample of three career groupings.

The data for this study consisted of a nationally representative sample of secondary public and private, full-time and part-time teachers derived from the 2007–2008 SASS database. The initial data set of more than 38,240 public school teachers was reduced to include only the full-time teachers who worked more than 10 hours a week. The group was further reduced to include only those teachers who taught (a) in a secondary level school and (b) in a regular program school. Secondary level school was defined as any graded school, which did not contain grades Pre-K through 6. This definition of secondary by the NCES meant that both junior high level and senior high level schools could be included in the sample. The school program type refers to the educational focus of the school, with possible programs including regular, vocational, alternative, and special education programs. Including only those teachers who indicated that their students were 'secondary' level made a final reduction. The resulting data set included 17,125 teachers.

For the present study, a smaller sub-sample was selected from this final set of 17,125 teachers. The larger sample was divided into three groups according to overall teaching experience, similar to Rosenholtz and Simpson's (1990) operational definition of teacher career stages (i.e., novices, less than 5 years; mid-career, 5–10 years; and veterans, 11 or more years).

RESULTS

Initially, means and standard deviations were computed for the independent and dependent variables. With regard to commitment, mean scores of career commitment were slightly higher than those of work commitment.

Respondents, on average, are prone to 'probably would become a teacher' (value close to 4) with the statement, 'If you could go back to your college days and start over again, would you become a teacher or not?' Further, on average they 'somewhat agree' (value close to 3) that they have positive administrative support (e.g., such things as being evaluated fairly, having principals whose behavior toward staff is supportive).

With regards to student disengagement, mean values (between 2 and 3) correspond to teachers' views that these student issues are between a 'minor' (2) and 'moderate' (3) problem in the school. Further, they indicate, on average, that they 'somewhat disagree' (value of 2) that they have intent to leave (e.g., if they could get a higher paying job they'd leave teaching as soon as possible).

There are apparent group mean differences in all variables that support our grouping of teacher based on career stages. For career commitment, the novice group showed significantly higher mean scores compared to both the mid-career and veteran groups. However, for job satisfaction, the veteran group showed significantly higher mean scores compared to both the novice and mid-career groups.

DEBT REPAYMENT CAPACITY OF LOCAL GOVERNMENT SECTOR. THE CASE OF POLAND DURING THE 2008-2013 ECONOMIC SLOWDOWN PERIOD

Krzysztof Kluza, Warsaw School of Economics (SGH)

ABSTRACT

The crisis which began in 2008 had a negative impact on the financial condition of local governments across the European Union. In Poland, the debt of the local government sector increased from 2.3% of GDP in 2008 to 4.2% of GDP in 2013. The growing indebtedness influenced the scope of countercyclical policies of local governments. At present, such policies appear as hardly sustainable in the context of future debt repayments and the required deleveraging process. The paper shows simulations concerning the ability of local governments to service their accumulated debt. In a moderately optimistic scenario when there is no new borrowing, over 25% of local governments will need more than 15 years to repay their existing debts. Although in 2013 the financial indicators showed sufficient space for debt servicing for 95% of local governments, the sector remains highly vulnerable to future adverse scenarios. The use of random sampling computational algorithms (Monte Carlo method) applied to the local government financial ratios based on free operating cash flow and net debt confirms the sector's negative credit risk exposure. Even modestly adverse scenarios show that ca. 20% of local governments will reach alarmingly low levels of their debt service indicators in the near future. The larger municipalities appear to be the local government subcategory with the highest credit risk exposure.

KEYWORDS: local governments, local government risk, debt repayment capacity, Monte Carlo method

INTRODUCTION

The crisis which began in 2008 had a negative impact on the financial condition of local governments (LGs) across the European Union. Their debt/GDP ratio grew from an average of 5.5% in 2008 to 7.7% in 2013. The adverse economic environment influenced in a negative way the financial standing of LGs and their ability to provide public services. This situation may hinder future economic growth from three basic perspectives: investment demand decrease, fiscal consolidation negative side effects and growth of credit risk and financial costs. Several pieces of research shows that LGs' spendings have relatively high productivity (Blöchliger, Égert 2013), (Fredriksen 2013) and thus effectively support economic growth. However, the historically high levels of LG investments became no longer sustainable – in relation to GDP they already dropped from 2.0% in 2009 to 1.6% in 2013, i.e. the lowest level since 2005. In addition, the current situation may require the implementation of stricter fiscal consolidation policies. The debate on how to implement fiscal consolidation to favour long-term growth is ongoing. The impact of fiscal policy tightening on growth is analyzed in (Barrell et al. 2012). It shows the possible adverse impact of fiscal consolidation on growth in the short-term horizon. Macroeconomic risks associated with deleveraging, including their impact on consumption, are modelled in (Eggertsson, Krugman 2012). There is also indicated a risk that increased productivity can reduce output in the case of the deleveraging process. Flaws of the fiscal austerity model for municipalities as a response to the crisis are shown (Peck 2014) and (Donald et al. 2014).

The economic slowdown also worsened the risk profile of local governments (Vammalle, Hulbert 2013). Since 2010, the local government sector in the European Union countries has experienced an overall decrease of its productivity, accompanied by a relative deterioration of its financial standing (Kluza 2014). This research further investigates the consequences of economic slowdown on the LG ability to service their current debt burden. Firstly, it conducts analysis of the financial standing of Polish LGs from the corporate finance perspective. That includes the calculation of ratios based on free operating cash flow, which are seldom considered by public sector entities. The constructed risk measures are based on (Palepu et al. 2004) and (Jajuga 2009). The research also presents assessment of existing debt repayment capacity of LGs in Poland. The second part of this paper is devoted to simulations of risk profile changes under specific scenarios. The modelling is conducted with the use of the Monte Carlo method, developed by Metropolis and Ulam (1949). Monte Carlo simulations are useful tools in finances. They are employed inter alia for estimating the value of real estate investments (Kelliher, Mahoney, 2000), risk of investments projects (Pawlak, 2012), valuation of companies (Białas 2012), credit risk assessment (Chyliński, 1999) as well as public sector policies evaluation (CP Yeh et al. 2014). The method involves random sampling of variables representing probability distributions for particular financial parameters. In this research it allows us to measure future changes of debt repayment capacity for LGs and their vulnerability to certain parameters.

METHODOLOGICAL NOTES

The analysis encompasses all local governments (LGs) in Poland, i.e. 2,809 entities: rural boroughs (RB), municipal-rural boroughs (MRB), municipal boroughs (MB), towns with county rights (TWCR), counties and provinces. All data about Polish LGs used in this research comes from the BESTI@ system run by the Ministry of Finance of Poland. Calculations for the Monte Carlo method were conducted with Microsoft Excel 2010 and Microsoft Visual Basic for Applications 7.0.

Financial Standing of Local Governments in Poland

During the recent economic slowdown, the debt of the local government sector in Poland increased from PLN 28.8 bn in 2008 to PLN 69.2 bn in 2013 with an annual growth rate (CAGR) of 19%. In relative terms it grew from 2.3% of GDP in 2008 to 4.2% of GDP in 2013. This was a result of systematic factors such as a slowdown of revenue growth combined with an increased amount of carried out commissioned tasks as well as individual policies of each entity in both cost management and implementation of environmental and infrastructural projects. Polish local governments implemented vast countercyclical policies. Their direct investments amounted on average to 13% of total investment in the Polish economy in the 2008-2013 period. However, the peak stage of investment spending took place in the 2009-2010 period with their 3.2% share in GDP. In 2013 LG investments dropped to 2.1% of GDP, the lowest for the last eight years. This trend confirms that former sizable investment policies of LGs appeared to be unsustainable in the context of servicing the accumulated debt burden.

Higher debt is typically associated with increased credit risk. The standard approach to evaluate LG sector risk is by using the gross debt to total revenue ratios. However such an approach delivers little information on debt repayment capacity. For the purpose of the LG financial standing assessment, two alternative indicators are proposed in this paper. They take into account the operating flows in LGs. They could be calculated using official budgetary reports presented by LGs. a. EBITDA / Gross Interest (EBITDA/GI ratio) Note, that in the case of LGs, EBITDA (Earnings before Interest, Taxes, Depreciation and Amortization) is equal to EBIT (Earnings before Interest and Taxes) since LG reporting in Poland is based on a cash basis. The typical warning signal is generated if this indicator is below the value of 2.0 for a given entity. Values below 1.0 show alarmingly low debt service capacity, approaching Ponzi-schemes. FOCF / Net Debt (FOCF/ND ratio) In this indicator, the net debt should include only interest bearing liabilities. FOCF (Free Operating Cash Flow) is the equivalent of operating surplus as defined in par. 242 of Public

Finance Law excluding accumulated historical budget surpluses, if any. For financially sound entities this indicator should amount to at least 20%.

Table 1: The Financial Standing Ratios for the Local Government Sector

	2008	2011	2013
EBITDA/GI	13.76	4.94	5.96
% of LGs with EBITDA/GI below 2.0	5%	16%	5%
FOCF/ND	1.75	0.27	0.31
% of LGs with FOCF/ND below 0.2	7%	36%	21%
Net debt / total revenues	7.7%	29.3%	30.3%

The indicators in Table 1 show that the worst financial situation of Polish LGs was in 2011. Although in 2013 there was some improvement of indicators based on operational surpluses, yet the free resources of LGs were systematically reduced as the net debt grew, and in 2013 for the first time it exceeded 30% of their revenues. In addition, the improvement between the years 2011 and 2013 was to a large extent the effect of a drop in market interest rates. In 2011, the average WIBOR 1M rate amounted to 4.37% compared to 3.04% in 2013, which had a direct impact on EBITDA/GI ratios.

The financial standing of LGs strongly differs between LG subcategories as presented in Table 2 below. Notably, the rural boroughs, which hold relatively low debt as well as adequately large operating surpluses to service it, have the best risk profile. Data shows that TWCR have the worst financial standing among LGs from the perspective of debt service capacity. Their ND/R ratio already reached 40% in 2013 and their average FOCF/ND ratio is dangerously low – for the last four years it has fluctuated around the 20% level. As a result, more than half of TWCR do not exceed the 0.2 threshold regarded as a safe level for the FOCF/ND ratio. Moreover, 17% of TWCR have an EBITDA/GI ratio below 2.0.

Table 2: Financial Standing Changes – Break Down By Local Government Subcategories

	2008	2011	2013	2008	2011	2013
	TWCR (65 entities)			RB (1571 entities)		
EBITDA/Gross Interest	10.39	3.42	4.33	24.06	7.84	10.05
% of LGs with EBITDA/GI below 2.0	3%	22%	17%	3%	14%	2%
FOCF/Net Debt	0.90	0.18	0.21	11.58	0.44	0.59
% of LGs with FOCF/Net Debt below 0.2	5%	62%	57%	5%	32%	15%
	MB (241 entities)			Counties (314 entities)		
EBITDA/Gross Interest	14.10	4.46	5.57	6.69	5.23	5.71
% of LGs with EBITDA/GI below 2.0	8%	22%	10%	15%	12%	9%
FOCF/Net Debt	2.15	0.25	0.30	1.58	0.39	0.35
% of LGs with FOCF/Net Debt below 0.2	8%	44%	31%	13%	25%	26%
	MRB (602 entities)			Provinces (16 entities)		
EBITDA/Gross Interest	14.33	5.05	6.50	32.77	7.52	7.20
% of LGs with EBITDA/GI below 2.0	4%	20%	5%	0%	6%	0%
FOCF/Net Debt	1.54	0.27	0.34	<i>no ND</i>	0.43	0.35
% of LGs with FOCF/Net Debt below 0.2	8%	44%	26%	0%	12%	12%

The accumulated debt may be repaid by LGs either with operational surpluses or sale of fixed assets. The analysis of LGs' financial reports and long-term financial plans reveals that numerous LGs will not be able to fully repay their debts within a 15-year time horizon based on their current historical financial flows. In the very optimistic scenario it is assumed that each entity will spend its total annual operating surplus and proceedings from sales of fixed assets on debt repayments and, in addition, it will not borrow any new debt. In the more realistic scenario, it is assumed that 40% of these resources will be spent on debt repayment and there will be no new borrowing. For both scenarios, the annual operating surpluses and sales of assets are calculated as an average from the 2011-2013 values. Even in the very optimistic scenario regarding budgetary policy of individual entities, it turns out that 112 LGs will require more than 15 years to repay

their gross debts – see Table 3. This group is over-represented by the counties. Switching to the more realistic scenario (with 40% of free financial resources spent on debt repayment), reveals that over 600 Polish LGs, including 50% of towns with county rights, would not be able to repay their debt in the 15-year horizon.

Table 3: Minimal Period Required to Repay Existing Debt - the Moderately Realistic Scenario (40% of Annual Operating Surplus and Proceedings From Sale of Assets Spent on Debt Repayment and No New Borrowing)

	no. of LGs	below years	3	3-5 years	5-10 years	10-15 years	15-20 years	above years	20
MB	241	7%		10%	33%	20%	13%		17%
MRB	602	10%		10%	28%	20%	13%		18%
RB	1571	19%		14%	29%	17%	9%		12%
TWCR	65	2%		5%	18%	25%	23%		28%
Counties	314	14%		9%	27%	16%	11%		23%
Provinces	16	6%		0%	44%	38%	13%		0%
Poland	2809	15%		12%	29%	18%	11%		15%

Monte-Carlo Simulations of Debt Service Indicators

The above analyses show that several local governments have a relatively constrained financial standing at the end of 2013. The important question is how their situation may change with different future economic scenarios. Simulations of changes in the financial standing of local governments may be carried out with the Monte Carlo method. A detailed description of the method and its vast applications can be found, for example, in Hendry (1984). In short, the method, instead of solving a numerical problem, is based on estimating a solution with the use of a random variable. The variable is chosen n times in a series of independent drawings. With the increasing number of repetitions, an obtained solution tends to be an effective estimator of a mean of simulated phenomenon. The random numbers used in simulations should reflect a relevant distribution consistent with the properties of the analyzed process.

In this research, triangular distributions of variables were implemented in the simulations. Such distributions are preferred in simulating many phenomena in finance and risk areas due to their natural easiness of reflecting scenarios for which there are predicted both the asymmetric changes of variables and the most likely outcome (Chyliński, 1999). A triangular distribution is a continuous probability distribution with a probability density function shaped like a triangle. It is defined by three values: the minimum value (min), the maximum value (max), and the peak value ($mode$), where $min \leq mode \leq max$. For the purpose of conducting the simulations, the inverse function of the cumulative distribution function is used. It has a form as follows:

$$F^{-1}(P) = \begin{cases} min + \sqrt{P(max - min)(mode - min)} & , \quad P < \frac{mode - min}{max - min} \\ max - \sqrt{(1 - P)(max - min)(max - mode)} & , \quad P \geq \frac{mode - min}{max - min} \end{cases}$$

In the simulations P is drawn randomly from the $\langle 0, 1 \rangle$ uniform distribution. In the case of the Monte Carlo method it is also important to determine the adequate number of iterations. The method assesses the estimation error based on the number of iterations. So using the equation for the total error: $\varepsilon = \frac{3\sigma}{\sqrt{N}}$, where σ is the standard deviation of the random variable and N is the number of repetitions it is possible to derive the minimal required number of repetitions for a specific error level.

The distributions analyzed in this paper are generally within the range $\langle 80\% \cdot \text{mode}; 140\% \cdot \text{mode} \rangle$. That brings the required number of iterations to $N = 49$ for 5% expected value error, $N = 308$ for 2% expected value error or $N = 1230$ for 1% expected value error. To find an acceptably small value for the number of iterations there were conducted goodness of fit tests (χ^2) between the 5000-iteration distribution and other distributions. The results of the tests, presented in Table 4, demonstrate that 50-iteration distribution is close to significant difference from a model distribution (5000 iterations): p -value 7.77%, thus it does not have the properties of a desired triangular distribution. Increasing the number of iterations to 100 significantly increases certainty that the obtained distribution is not statistically different from the model distribution (p -value 22.24%). As a result, all simulations of local government financial ratios were conducted with 100 drawings of the random variable.

Table 4: The Results of Goodness of Fit Tests (χ^2) Between the Model Distribution (5000 Iterations) and Distributions Obtained With Smaller Number of Iterations

5000-iteration distribution compared to:	χ^2 statistics	p -value
50-iteration distribution	15.52	7.77%
100-iteration distribution	11.84	22.24%
200-iteration distribution	7.70	56.45%

Note: all analyzed distributions have the same parameters, i.e. $\text{mode} = 100$ and the range: $\langle 80\% \cdot \text{mode}; 140\% \cdot \text{mode} \rangle$. Degrees of freedom = 9.

The Monte Carlo simulations were run for four financial categories: operating revenues, operating expenses (excl. debt service expense), debt service expenses, cash and cash equivalents (balance sheet category). Based on the simulation results, the ratios of $EBITDA/GI$ and $FOCF/ND$ were calculated for the *next* year. The simulated financial categories are independent from each other. In practice, some indirect dependence takes place between operating revenues and operating expenses, as decision makers take into consideration operating deficit among other key indicators during a budgeting process. However, the interdependence of these two categories is not strict since usually a larger proportion of expenses is fixed (in nominal terms or as indexed categories) compared to revenues, which are more flexible and subject to current managerial and political decisions.

Table 5 shows assumptions for each scenario. The basic scenario is relatively conservative, leading to an improved financial standing of local governments compared to the previous year. Other scenarios assume more relaxed spending policy of local governments, although the growths of expenses are also relatively modest, within realistic ranges.

Table 5: Scenario Assumptions for Monte Carlo Simulations

	1. Basic Scenario			2.A Scenario			2.B Scenario		
	<i>min</i>	<i>mode*</i>	<i>max</i>	<i>min</i>	<i>mode*</i>	<i>max</i>	<i>min</i>	<i>mode*</i>	<i>max</i>
Operating revenues	-10%	100	20%	-10%	100	20%	-10%	100	20%
Operating expenses (excl. debt service expenses)	-10%	100	20%	-10%	100	25%	-10%	100	33%
Debt service expenses	-10%	100	5%	-10%	100	5%	-10%	100	5%
Cash and cash equivalents	-20%	100	10%	-20%	100	10%	-20%	100	10%
	3.A Scenario			3.B Scenario					
	<i>min</i>	<i>mode*</i>	<i>max</i>	<i>min</i>	<i>mode*</i>	<i>max</i>			
Operating revenues	-10%	100	20%	-10%	100	20%			
Operating expenses (excl. debt service expenses)	-10%	102	20%	-10%	102	28%			
Debt service expenses	-10%	100	5%	-10%	100	5%			
Cash and cash equivalents	-20%	100	10%	-20%	100	10%			

* $\text{mode} = 100$ denotes using as a mode the value from the previous year for the given financial category; $\text{mode} = 102$ denotes using as a mode the value from the previous year increased by 2%. Note: *min* and *max* parameters are presented as % difference from mode value.

In addition, all scenarios assume a decrease of debt service costs, which reflects the current cycle of interest rates drops in Poland. The simulations for the scenarios in Table 5 were conducted for each local government in Poland. As a result 2 809 000 observations were obtained (for ratios *EBITDA/GI* and *FOCF/ND*).

The summary of simulation results is in Table 6. There are presented proportions of local governments which exceed warning levels for *EBITDA/GI* and *FOCF/ND* indicators. The warning levels of 2.0 and 0.2 for *EBITDA/GI* and *FOCF/ND*, respectively, are typical thresholds which, in the case of commercial entities, indicate high risk of non-repayment of the existing debt. However, in the case of public sector entities, which by definition do not face market risk and have legislative instruments to secure additional revenues, these levels are rather of an indicative nature, showing the overall financial strength of the sector. Thus, as it is presented in Table 6, even with modestly negative scenarios, like Scenario 2B and 3B, there will be created noticeable financial strains in ca. 40% of local governments.

The alarming levels for *EBITDA/GI* and *FOCF/ND* ratios amount to 1.0 and 0.1 respectively. As the Monte Carlo simulations show such levels may be crossed by 10%-20% of local governments, depending on the scenario. Comparing this with the current proportion amounting to ca. 2%-4%, the analysis indicates the potential for a deep credit risk deterioration of the local government sector in Poland. Comparison between the *EBITDA/GI* ratio distribution reveals that e.g. for the 20th percentile the *EBITDA/GI* ratio is more than 2.5 times lower in Scenario 2B and 3B than in the basic scenario. This indicates a high vulnerability of local governments with a currently weak financial standing to any adverse changes in their budgets. The adverse changes may be caused by, for example, interest rates increases, future macroeconomic slowdown, growth of local unemployment, increased local migrations or similar and quite likely events.

Table 6: Results of Monte Carlo Simulations for All Local Governments

% of all LGs	EBITDA/GI				FOCF/ND			
	ratio below 1.0	hitting the 1.0 barrier*	ratio below 2.0	hitting the 2.0 barrier*	ratio below 0.1	hitting the 0.1 barrier*	ratio below 0.2	hitting the 0.2 barrier*
Initial situation (real data for 2013)	1.4%	-	4.7%	-	4.8%	-	21.0%	-
1. Basic scenario	1.4%	1.4%	4.3%	4.7%	4.8%	6.1%	20.2%	25.6%
2.A Scenario	3.6%	10.0%	9.0%	17.8%	9.7%	17.4%	28.4%	35.2%
2.B Scenario	12.5%	22.2%	53.4%	62.3%	23.4%	59.9%	43.2%	70.7%
3.A Scenario	4.0%	4.4%	10.4%	11.1%	10.6%	13.3%	29.7%	35.4%
3.B Scenario	13.8%	39.1%	23.5%	48.9%	25.0%	47.0%	44.0%	60.8%

* This ratio indicates % of entities which have in their ratio simulated distributions at least one observation below the indicated ratio level. Although the average value of a given ratio for such entities may be above the warning level, there exists a perceptible probability that a specific scenario may end up for them with falling below the warning level.

The weakest financial standing is exhibited by TWCRs. These major municipalities are highly vulnerable to even mildly negative scenarios such as Scenario 2A and 3A. One third of them may have the analyzed indicators at alarming levels, regardless of the simulated scenario, and in the future they will require implementation of austerity plans or similar budgetary policies. Although this category consists of only 65 entities out of 2809 local governments, it covers 33% of Poland's population and 35% of all local government revenues. Thus financial troubles of the towns with county rights may create systemic problems for the whole public sector.

INVESTMENT BEHAVIOR OF INTERNATIONAL CAPITAL IN ASIA

Tzu-Yi Yang, Ming Chi University of Technology
Yu-Tai Yang, Army Academic (Department of Aircraft), R.O.C.

ABSTRACT

Many studies on the international capital investment behavior have proved the existence of investment behavior and positive feedback trading of international capitals in either theoretical or empirical analyses. However, most researches have not tested the characters of investment behavior, but simply used statistics analysis to determine if the investment behavior exists. As those studies failed to probe into the actual causes behind such behavior, they hardly contained the linkage between the theory and empirical evidence. This study is based on the definition of herding brought by Bikhchandani and Sarma (2001) and targets Asian countries for sampling with a six-year period of sampling international capitals. We aim to discuss if there are “Buy high, sell low” (or “Buy previous winners, sell previous losers”), “positive feedback trading,” and “investment behavior” in the global international capitals. We also explore the possible factors behind these phenomena.

KEYWORDS: International Capital, positive feedback trading, herding,

INTRODUCTION

Against the backdrop of freer international financial markets and more liquid global cash flows, the international capital behavior has left a significant impact on a country's economy and finance, leading to both positive and negative results. On the positive side, international capitals could spur a country to institute more sound and open economic policies and practices while helping the country to boost financial liberalization and globalization. However, the liquid and fast-moving nature of international capitals could also cause financial problems to some degree in a country or region. For example, the 1994's Mexican financial crisis and 1997 Asian financial crisis both were directly or indirectly linked to the behavioral pattern of international capitals. Therefore, study of the liquid nature of the international capitals should be placed on the forefront of current financial researches. Previous research has focused largely on international capitals' negative side, probably because those negative results exert a much more significant impact on a country's financial market than do their positive results.

This paper, based on Bikhchandani and Sarma's (2001) definition of investment behavior, aims at describing two different models and at discussing if there are positive feedback trading and investment behavior in global international capitals. It also makes a preliminary analysis on the trend of international capitals in globally emerging markets, with special attention to Asia's emerging markets.

This paper covers not only whether there is “positive feedback trading” or “investment behavior” in international capitals, but also a probe into the real causes of investment behavior. The results of the present study could provide investors with information on stock returns and foreign-exchange fluctuation in mutual-fund behavior, information that will help them decide on their own portfolios and investment patterns. Even the relevant authorities could take the study results into consideration in decision-making. The paper consists of a literature review, data description and analysis, and an empirical research.

LITERATURE REVIEW

Devenow and Welch (1996) indicated that in addition to financial data, agency policies and information learning would also provide some insight on international capital behavior. They found the rational investment behaviors in financial markets include information acquisition, investment decisions, banking management, information level, investment behavior, market-efficiency hypotheses, and non-rational investment behavior. In the aspect of financial theories, Devenow and Welch consider how to incorporate rational herding information that could swiftly affect market prices. Although there is mutual-fund investment behavior in the research papers of Borensztein and Gelos (2003), not all international capitals have apparent herding effects. For example, open-ended international capitals show more obvious investment behavior than do their close-ended counterparts. We, the authors of the present study, adopt the momentum strategy, also called “Buy high, sell low” strategy, in measuring investment behavior. Thus, we could see various methods to prove the existence of herding behavior

Several empirical studies regarding mutual-fund statistical methods, such as Froot, O’Connell and Seasholes (2001), suggest that a stable fund flow does not guarantee a continuous return. As the factors that affect fund flow are based on the previous return, the price sensitivity of regional stocks has a positive and massive impact on overseas fund inflow. What’s noteworthy here is the fact that price seems to have consistency with the persistence of a fund flow and that the interruption in fund flow could have an impact on its future return. Meanwhile, the authors of the present study divided a total of 44 countries into five major areas when analyzing whether a correlation exists between the stock markets in the divided regions and international capital behavior. We used the analytic method of variance to test the correlation between fund flow and return and found that the inflow of global funds could predict future returns in the emerging markets.

Asia’s emerging markets see the greatest significance among the global markets. Kim and Wei (2002) adopted the dynamic-trading model, the performance model, and the LSV-stock-return model and incorporated four dimensions (i.e., Korea’s offshore, domestic, single, and institution investors), three periods (i.e., steadiness, pre-Asian-financial-crisis and during-Asian-financial-crisis) and Korea’s stock and international capital data to probe into its difference through dynamic-effect and herding-effect models. The results showed that both dynamic effect and investment behavior had significance. Moreover, the investment behavior in either individual investors or institutional investors in overseas markets is more apparent than that in domestic markets. However, herding models using the change in stock portfolio held by single investors to prove the herding effect could only come up with unilateral results. The analysis of fund inflow should not cover only a single country’s stock market, but should probe its behavioral patterns on the basis of the overall fund flow. Thus, Kim and Wei could only prove that there is international capital investment behavior in Korea’s stock market, failing to identify the overall herding effect. Borensztein and Gelos (2003) indicated in their research that the investment behavior in open-ended international capitals is more prevalent than that in close-ended international capitals and that the investment behavior of global international capitals in larger emerging markets is more common. Meanwhile, emerging-market funds have a momentum strategy, i.e., “Buy high and sell low.” Therefore, mutual-fund investment behavior in the emerging markets seems more significant. That, in part, is why the present study is based on the 13 Asian emerging markets in an effort to identify herding effects from overall fund flows.

DATA DESCRIPTION AND ANALYSIS

These data of global fund flow and destination are sourced from Emerging Portfolio.com Fund Research (EPFR). The database, which includes 10,000 global investment companies, emerging markets, and American funds (including offshore and domestic registered funds), could trace the cross-boarder fund flow of stocks and bonds. The total assets under management totaled 5 trillion US dollars. Most of the

international strategic managers, investment managers, and academic research institutions use the data as a tool to study and analyze the emerging market and international financial issues.

This paper collected those data of stock markets and foreign exchange markets of each country from the sources of InfoWinner database under Infotimes, Taiwan Economic Journal and Data Stream, IFS and IMF database under International Monetary Fund. We also collected the data of the foreign exchange markets in 13 Asian countries from charged IMF database. As the service of IMF database is not provided for academic research, we went to great lengths negotiating with them to obtain their approval for using these data, which cover the member nations under IMF, macroeconomic indicators, and international economic statistic data. Those databases would be sufficient to provide data resources of all financial researches (excluding those conducted in Taiwan).

The present targets the data of stock markets in 13 Asia's emerging countries, except for Japan and Vietnam. Japan is not included in the Asian emerging markets and Vietnam does not provide stock market information in the above database, with its international capital flow less than 1% of total and not being the initiating countries of Asian financial crisis. The data collection started in January 1996 and ended in October 2004, spanning the daily data of pre-, during-, and post-Asian financial crisis. Then the daily information was calculated as monthly average data. These data include changes in the outflow of international capitals in each country, monthly moving average of share prices and foreign exchange rates. The fact that these data were all from the same period ensures consistency in all the data of research samples.

THE EMPIRICAL STUDY

This section mainly probe if there is a “Buy high, sell low” phenomenon and investment behavior in the global mutual-fund behavior in the 13 Asia's emerging markets. We compare the models in the three major categories: the data of overall international capitals in the 13 Asian countries during the Asian financial crisis. The empirical analysis in this research contains: (1) assessment of the fluctuation of stock returns and foreign-exchange rates using the fluctuation model of global international capital flow, along with introducing Model I and Model II, (2) analysis of the connections between stock returns and foreign exchange rates fluctuating against the global mutual-fund flow. The following is the empirical process of our research.

Model I: This is mainly to discuss the positive feedback trading effect of stock returns and foreign exchange rates fluctuating on international capital flow. It uses the impact of change in stock return and foreign exchange rate fluctuations during the $t-1$ period or even the $t-3$ period of international capital flow, which is the so-called the correlation behavior (fundamental driven) of “Buy high, sell low” or “Buy low, sell high.” A positive α coefficient would indicate the existence of positive feedback trading effect:

$$KI_{i,t} = \alpha_0 + \sum_{i=0}^3 \beta_i StockR_{t-i} + \sum_{i=0}^3 \gamma_i ExchR_{t-i} + \varepsilon_i \quad (1)$$

KI represents variation in international capital flow

Model II: This is based on the autocorrelation of international capital flow to probe the herding effect of international capital inflow. According to Bikhchandani and Sharma's (2001) definition of international capital investment behavior, herding effect is the degree of a “copycat” behavior of a person who observes others' behavior.” Thus, the capital inflow in the current period has actually reflected the condition of other international capital flowing into the country in the $t-1$, or even $t-2$, period. A positive α coefficient would indicate that the inflow or outflow of the international capital in the current period is actually based on the mutual-fund behavior in previous periods. This is exactly the herding phenomenon.

$$KI_{i,t} = \alpha_0 + \sum_{i=1}^2 \alpha_i KI_{t-i} + \sum_{i=0}^3 \beta_i StockR_{t-i} + \sum_{i=0}^3 \gamma_i ExchR_{t-i} + \varepsilon_i$$

(2)

The empirical analysis of international capital flow into Asia's emerging markets is needed. Did the international capital jointly flow into Asia's emerging markets in the wake of the 1997 Asian financial crisis? We need to use models to verify the behavior's trend and pattern. One thing, no doubt, is clear: the total volume of international capitals into Asia is gradually increasing. This is mainly caused by the fact that the economic growth in the Asia's emerging countries, such as Korea, China, and Vietnam, is relatively higher than those in the other regions, and this growth is attractive to foreign investors. Although the inflow of foreign investment could boost Asia's economy, the massive withdrawal of foreign money could result in a serious financial crisis. Our main purpose in studying mutual-fund behavior is to find out how to prevent the recurrence of such crisis in Asia.

We use Models I and II to see if there is a significant relationship between the macroeconomic indicators of the 13 Asian countries and mutual-fund behaviors. Especially in model II, the study incorporates the autocorrelation coefficients of international capital inflow and outflow, in order to identify the real investment behavior through this model. The results of our regression analysis find that 55% of the total volume of international capitals into the stock markets and foreign exchange markets in Asia's emerging countries does create some kind of impact (see Table 1). In Model I, we discover the "Buy high, sell low" positive feedback trading effect in the international capitals in the stock markets of Asia's emerging countries from the current period to the return period (t+1) or (t+3). Such correlation is quite significant. On the contrary, this positive feedback trading effect sees no significance in the fluctuation of the foreign exchange rate. In other words, the investment strategies of international capitals mainly focus on Asia's stock returns, which have the positive feedback trading effect.

Following our understanding of the positive feedback trading effect of international capitals on stock market returns, we should further use Model II to test if there is international capital investment behavior in this part. The results in the test of autocorrelation of international capital flow show that such behavior would have an impact on other investors and would attract their attention or precipitate their "copycat" behavior either in the period (t+1) or period(t+2). This would be defined as the existence of investment behavior, with high degree of significance.

Meanwhile, the present study spans over the entire period of the Asian financial crisis. Thus, we classify the 13 Asia's emerging countries at one time to conduct further study. First, we divide the entire sample into the countries affected by the financial crisis and those not affected by the crisis and further divide the two major groups into pre-, during-, and post-financial crisis to explore the linkage between international capital behaviors in different time periods and different impacts. In this paper, pre-financial-crisis refers to the period from January 1996 to June 1997, a total of 17 months; during financial crisis goes from July 1997 to December 1998, a total of 18 months; and post-financial crisis from January 1999 to November 2004, a total of 70 months. Countries affected by the financial crisis refer to those suffering from dire consequences, such as the Philippines, Thailand, Indonesia, Korea, and Malaysia. The rest are those countries not seriously affected. Therefore, this research is classified by pre, during, and post-financial crisis, and by the countries involved and not involved in the financial crisis. We also employ the empirical models of investment behavior and positive feedback trading effect to explore the connection of international capital behaviors.

In the empirical results presented in Table 2, we found positive feedback trading phenomenon in stock returns in the both groups of countries-- involved and not involved in the financial crisis. However, this kind of classification fails to identify investment behavior, which could possibly show less significance

under such circumstances. Thus, this study continues to discriminate by the time factor between those countries involved in financial crisis and those not involved.

In Tables 3 and 4, we could easily see that the results are way different from those in Table 4. First, in those countries not involved in financial crisis -- Bangladesh, India, Hong Kong, China, Taiwan, Singapore, Sri Lanka, and Pakistan-- we could see stock returns showing high significance in those countries not involved in the financial crisis. We also found that most investors regarded returns as their major consideration but were less concerned with the changes in currency exchange rate, probably because such changes did not provide as much attractive return as the stock market did. On the other hand, our study finds no investment behavior in those countries not involved in financial crisis before or after the crisis, probably because these enhanced their information transparency and reduce their investment behaviors indirectly.

Table 1: The regression analysis of EPFR and 13 Asia's emerging countries

*Instruction: 1. The dependent variable is the variation of international capital flow; figures in parentheses represent t values; 2. *, **, *** represent 10%, 5%, and 1% significant level respectively. 3. A negative EXCH value represents the appreciation of the currency exchange rate.*

CONCLUSION

In view of the empirical analysis presented in the preceding section, only positive feedback trading effects or investment behavior would appear, again in specific conditions (as in Tables 3 and 4). Anyhow, the empirical purpose in this study is to ascertain if these behaviors could contribute to economic development and to see if we could bring up suggestions to the practitioners.

To portfolio managers and investors, funds are basically managed by fund managers who intend to make returns so as to attract more funds under their management. These managers, however, should have an in-depth understanding of the fund's nature. The positive feedback trading effect is a positive occurrence for portfolio managers as it could make countries come up with effective countermeasures during a financial crisis so as to profit from investment behaviors. However, there is both a positive side and a negative side in investment behavior. Portfolio managers should think correctly as investment behavior often results from the time lag of market information acquisition making the portfolio managers unable to make appropriate investment decisions. When following others' investment behavior, the followers could make a profit if the direction is right; otherwise, they would suffer losses. Therefore, given the fund investment behavior,

portfolio managers should engage in prudent thinking. The individual investors also have to understand the risks of fund investments and to make sure if the country, or period, in which they pour money has the problem of poor information transparency.

Briefly, the present study is intended mainly to explore the behavioral phenomena of global capitals. Our empirical evidence suggests the existence of both positive feedback trading effect and investment behavior, although it has failed to particularly dig into the factors that lure international capitals.

NAVIGATING THE PUBLISHING PROCESS

Terrance Jalbert, The University of Hawaii-Hilo

ABSTRACT

GETTING AN IDEA

1. Maintain a running list of your ideas.
2. Every time you have a few minutes, go to your list and ask yourself, in the next 30 minutes how can I advance one of these ideas.

RESEARCH PARTNERS

Selecting a Partner

1. There are advantages to working on your own.
2. Select someone with the right characteristics
 - a. Hard Worker
 - b. Willing to do their share of the work
 - c. Someone with time to conduct research
 - d. Intelligent
 - e. Mutual Interests
 - f. Cooperative
 - g. Likely to reciprocate
3. Good research partners are hard to find. Don't abuse a good research partner.

Working with a Partner

1. Start only one paper at a time with a new research partner.
2. Be patient with your research partner. They have a life and due to births, illnesses and other life events, they may not be on your schedule.
3. Recognize on some projects you will do most of the work. On others, your partner may do most of the work.
4. Use caution when selecting one of the professors from your Ph.D. program as a research partner.

How Many Authors on a Paper?

1. Two or three authors are good.
2. Four authors is not good but can be ok.
3. More than four authors looks bad.

WRITING YOUR MANUSCRIPT

Writing your Manuscript

1. Use only Microsoft Word to type your document.
2. Using free Word clones causes significant problems in the publication process.
3. Files created in another program and copied or saved as a Microsoft Word file cause significant problems in the publication process.
4. Unless the journal specifically requests otherwise, use the standard Microsoft Word equation editor.
5. Use only Microsoft spreadsheets and Microsoft
6. drawing programs.
7. Back up your files on a daily basis.

Organizing your paper

1. Organization
2. Abstract

3. Introduction
4. Literature Review
5. Data and Methodology
6. Results
7. Concluding Comments

Title

1. Descriptive and no more than 15 words.
2. Write a strong title
 - a. Strong Words:
 - i. Empirical, Evidence
 - b. Weak Words:
 - i. Analysis, Case
 - ii. Use Key Words from your Discipline
3. Think about what will look good on your vita.

Abstract

1. General Introduction to your paper
2. The goal is to precisely communicate to the reader what the paper is about.
3. Not more than 200 words
4. Do not use acronyms
5. Generally do not cite other papers in the abstract

Introduction

1. A brief introduction to the problem being addressed.
2. Include some summary statistics of the magnitude of the problem.
3. One paragraph discussion of the general state of the literature.
4. What you are going to do in the paper to advance the literature.
5. A few lines indicating how the remainder of the document is organized.

Literature Review

1. As a general rule do not cite magazines.
2. Use scholar.google.com
3. Narrow your literature review down to those articles that directly relate to the issue you are addressing in your paper.
4. Make sure that everything that you cite in the text is included in your reference section.
5. Make sure that everything you reference is cited in the body of the text.

Data and Methodology

1. Where the data was obtained from?
2. Time period covered in the analysis?
3. Frequency of the data observations?
4. Variables that the data were collected for?
5. Summary statistics.
6. Hypotheses that are being tested.
7. For regressions, specify the equation being estimated in the text of the document.
8. For Surveys indicate
 - a. Questions included in your survey? (Consider including the survey instrument as an appendix to the paper)
 - b. When was the survey conducted?
 - c. Where was the survey conducted?
 - d. What was the response rate?
 - e. What are the total number of usable observations?

- f. Did you receive human subject research permission from your University?

Results

1. Make sure to introduce each table and figure you present in the text of your document.
2. Walk the reader through the results.
3. Select an observation in your table and explain that observation to the reader.
4. Incorporate data into MS Word tables.
5. Segregate your data when possible to get additional results,
 - a. by gender, age, country, region, year, industry, before and after a crises.

Tables

1. Don't create small one or two line tables.
2. Include information directly in the document text.
3. Combine several small tables into a single table with multiple panels.
4. Do not use exponential notation (3.2E-5).
5. Display appropriate precision
 - a. 0.0021, 1.134, 10.22, 100.6, 1,049.1, 10,432

Table Description

1. Make sure to include a 3-6 line description below your tables. The reader should be able to understand what is contained in the table without referring back to the text of the document.
2. This description is not to replace the discussion in the text, but to supplement the discussion in the text.
3. Redundancy is ok in this case.
4. Example of Table Description

*This table shows the results of the regressions on CEO compensation using data from 2004. The estimated equation is: $CEO\ Compensation = a + b_1(CEO\ age) + b_2(years\ with\ company)$. The first figure in each cell is the regression coefficient. The second figure in each cell is the t-statistic. ***, ** and * indicate significance at the 1, 5, and 10 percent levels respectively.*

Concluding Comments

1. Reiterate the goal of your paper.
2. Briefly describe the test methodology and data.
3. Briefly summarize your major findings.
4. Discuss how managers might benefit from the results.
5. Discuss any limitations of your work.
6. Provide suggestions for future research.

Acknowledgements

1. Do acknowledge anyone that has helped you with the paper.

Colleagues, Administrators, Funding Agencies, Assistants, Reviewers, Editors.
It is a nice courtesy to the reviewers and editor.
2. It subtly communicates to colleagues the journal is peer reviewed.
3. Few people will be insulted if you acknowledge them but should not have.
4. Many will be insulted if you do not acknowledge them but should have.
5. Acknowledgments-Make sure to indicate that any remaining errors are the authors responsibility.
6. If someone has contributed substantially to your paper consider making them a co-author on the paper rather than just acknowledging them.

Biography

1. Your biography should indicate your employer, your publication history, contact information and any other important information.

Tom Tetertall, Ph.D. is Professor of Management at the University of East Hawaii. He is also an arbitrator for the Human Ethics Commission. His research appears in journals that include: Diversity Review, Management Styles, and Latino Business Review. He can be contacted at: University of East Hawaii, COB, 400 W. 2nd St., Kauai Hawaii, 96333, USA, email: tomt@NHI.edu.

2. Do not make your biography excessively detailed.

FORMATTING

1. Editors are looking for papers that are high quality. But they also look for papers that will not add an excessive burden to their work load.
2. They look for authors that will be pleasant to work with on revisions and in the publication process.
3. A properly formatted and written paper communicates to the editor that you will be pleasant to work with, thereby increasing your chance of publication.
4. Check the journal style guidelines to make sure you have the paper formatted properly.
5. Be sure figures and tables are editable in Word
6. Anything created or imported as an image is problematic.
7. Anything that is scanned needs to be recreated.
8. Make sure that figures and tables are legible.
9. If you are unable to edit it in MS Word it should be recreated.
10. When copying from Excel into word make sure to use the “Paste Special”, “Paste as Chart” Command so it can be edited in MS Word.
11. Avoid one-sentence paragraphs.
12. Avoid one-paragraph sections.
13. If you have subsections underneath a main section, start the main section by indicating how the subsections are laid out.
14. Bullet lists do not appear well in journals.
 - a. Longer lists should be placed in a table. Then reference the table in the text of the document.
 - b. Shorter lists should be incorporated directly into the text.
15. Make sure your references are formatted according to journal guidelines.
16. Do not use text boxes
17. Do not use section breaks.
18. Do not use text levels

WRITING QUALITY

1. Use the grammar checker in MS Word.
2. Use an advanced writing editor:
 - a. Stylewriter **
 - b. Whitesmoke.
3. Write in third person active voice when possible.
4. Give it to a friend to read.

WORKING WITH THE EDITOR

Submissions

1. Leave your document set for 1-2 weeks between completion and submission. Give the document a final read before submission.
2. Indicate in your submission correspondence that the paper is not under review elsewhere and has not been published elsewhere.
3. Never EVER submit a document to two journals simultaneously.

Correspondence

1. Don't ask the editor every week for a status update. (every 2-3 months is sufficient)
2. If you are close to a tenure or promotion decision, do let the editor know. Editors are human and will commonly try to get the review completed prior to the promotion decision date.
3. Use submission numbers in all correspondences.
4. Be courteous when corresponding with the editor.
5. Publishing is to a certain degree political. Be willing to review papers for the journal.

Reputation

1. Our industry is small. Editors remember if you were especially easy or especially hard to work with.
2. Your reputation is very important, so make sure you leave the best possible impression, even if your paper is rejected.

Nonresponsive Editors

1. After 3 months, ask if there is any additional information you can provide.
2. After 6 and 9 months request that the editor send a reminder to the reviewers.
3. After 1 year send the editor a status check email.
4. After one year and two weeks, if the editor has not responded, send them a letter withdrawing your paper from publication consideration and try elsewhere.

REVIEWER AND EDITOR COMMENTS

1. Respond to revise and resubmit requests as quickly as possible, but take sufficient time to complete the requested changes.
2. Set the revised manuscript down for a week and reread the paper before submitting it.
3. Do not send the exact same version back to the editor without having addressed the concerns of the reviewers.
4. Do not respond rudely.
5. Prepare a document that indicates how you have addressed each of the reviewers concerns.
6. Your document should review each change that the reviewer has requested and your response to each request individually.

Reviewer Comment: In your data section please indicate the number of observations.

Author Response: Thank you for your suggestion. We have incorporated a sentence indicating the number of observations on page 22 as follows. "The data included 2,436 usable observations."

7. In the event that you are not able to address a reviewers concern. Explain carefully why you are not making the changes, and request the reviewers understanding. Acknowledge the issue in the paper and note it as a limitation, or area for future research.

ACCEPTANCES

1. Make sure to read the page proofs carefully.
2. Pay any fees due. Publishing is expensive, but it is a necessary evil. You have invested a great deal of your time in the research, the publication fee is a small part of your total investment in the project.
3. Expect some time between acceptance and publication.

REJECTIONS

1. Rejections happen.
2. Don't be discouraged by a rejection. Rejections are part of the process.
3. Make any changes that the editor and reviewers suggest and submit the paper to a different journal.

ELECTRICITY SECTOR RESTRUCTURING AND POWER SUPPLY RELIABILITY IN NIGERIA

Ado Ahmed, Abubakar Tafawa Balewa University (ATB), Bauchi, Nigeria
Bala Suleiman Dalhat, Abubakar Tafawa Balewa University (ATB), Bauchi, Nigeria
Malo Mangai Josiah, Abubakar Tafawa Balewa University (ATB), Bauchi, Nigeria

ABSTRACT

The public sector has for long monopolised the supply of infrastructure services in Nigeria. It is also true that the public sector has become unable to sufficiently provide for the infrastructure needs of the Nigerian economy leading to huge deficit and self provision by consumers especially businesses. The deregulation of the industry therefore provides the means for private participation. Could this opening lead to power supply reliability that the business sector dearly needs? The research assesses perception of firms' management on the opening up of the electricity market on power supply reliability. We adopted survey method to collect data from manufacturing firms in Enugu, Onitsha, Lagos, Port Harcourt and Kano representing the major industrial and commercial centres of the country. Simple linear regression model was used in data analysis and hypothesis testing. The result indicates that the IV (ESR) has significant influence on the DV (PSR) with a p value of .004. The model explains about 33% of variation in the DV. The paper therefore recommends for improvement in the prevailing investment climate in the country as a way of boosting private sector participation that could result in power supply reliability to the Nigerian economy.

KEY WORDS: Private Sector Investment, Power Supply Reliability, Manufacturing Firms, Investment Climate

INTRODUCTION

Private sector is gradually becoming active today in the infrastructure sub-sector of developing and transition economies. Government investment in the electricity sector has failed to guarantee power supply adequacy and reliability which are important ingredients for national economic development. Unreliable power supply in Nigeria just like in many other African economies has negatively impacted on the living standard of the people, has increased costs of doing business and worsens the poverty situation of Nigerians (Adenikinju, 2005; Iwayemi, 2008; Adoghe, Odigwe and Igbinovia, 2009). Consequent upon the failure of the Nigerian electricity industry to provide adequate power supply to the economy the business sector expend significant amount of resources to offset the deficiencies in publicly provided services which the publicly owned monopoly (NEPA now, PHCN) failed to provide. Until the reform of the sector in 2005, NEPA (National Electric Power Authority) remained the only monopoly in the industry whose operations were characterised by inefficiencies, under investment, low tariff and deficient supply of electricity (Anas, Lee and Murry, 1996; Adenikinju, 2005; Iwayemi, 2008).

Due to the dismal performance of the industry, the Nigerian government introduced industry wide reform to promote private investment with the aim of promoting competition, enhancing efficiency and ultimately strengthening power supply reliability that could spur economic growth and development of the Nigerian economy (FGN, 2010). The opening up of the industry which was long overdue was expected to lead to increased investment in the electricity sector of Nigeria and ultimately contribute to increased electricity supply. The potentials of this development in reducing the reliance of the business sector on self provision of electricity especially the small scale business are high. It has long been argued that the opening up of the

electricity sector for private investment and appropriate pricing of electricity present the best opportunity for redressing the dismal performance of the Nigerian electricity sector (World Bank, 1994; Anas, et al, 1996; Adenikinju, 2005; Iwayemi, 2008). The reform of the electricity sector has led to the unbundling of the sector into generation, transmission and distribution and the creation of the sector regulator (NERC) among others. The study therefore surveys the perception of business firms on the impact of the private sector participation on promoting electricity supply reliability.

Study's Objectives and Hypotheses: The study is guided by the following objective and hypothesis.

Objective: The objective of the study is to assess the impact of electricity restructuring on power supply reliability in Nigeria.

Hypothesis

Ho: Electricity sector restructuring in does not have significant effect on power supply reliability in Nigeria.

H₁: Electricity sector restructuring significantly impacts on power supply reliability in Nigeria

LITERATURE REVIEW

This section is subdivided into three sub-sections. Traditional (Public) Financing of Electricity Infrastructure. The provision of infrastructure services used to be the preserve of the public sector especially in the developing world (Merna and Nkiru, 1998; 2002). This was due to the consideration of infrastructure as a strategic sector of the economy and the huge quantum of resources required financing an infrastructure project (Estache, 2005). Consequently state owned utilities sprang up providing infrastructure services. The infrastructure sector became a monopoly sector with only the state utilities operating in the sector. This led to the monopolization of the infrastructure industry and the consequent failure of the industry to provide efficient services to the customers due to operational inefficiency, politicization of the industry under investment among others (Baumol and Lee, 1991; Anas, Lee and Murry, 1996). The Nigerian electricity supply industry dominated by NEPA has failed to provide the electricity needs of the Nigerian economy leading to widespread private provision (Adenikinju, 2005).

The failure of the industry to provide for the electricity needs of the Nigerian economy has been attributed to the public monopoly of the industry and most especially the inability of the government to provide the investments needed to expand the industry's generation, transmission and distribution infrastructure (Anas, et al, 1996; Ilori, 2002). Anas et al (1996) argue that policy of protecting the public infrastructure monopolies results in sub-optimal performance which constrains the capacity of the industry to supply sufficient power to the economy. Such a protectionist policy prevents the users of infrastructure services from seeking other sources of infrastructure services and compels them to remain captive to the inefficient public utility sector. There is a compelling argument therefore for policy makers to consider the opening up of the electricity sector to private investment which could fill in the electricity supply gaps that have proved inadequate and difficult to improve by the public sector. There is therefore an urgent need for the restructuring of the regulatory framework to unwind the complex web of regulatory and institutional barriers which inhibit the private provision of infrastructure services (Baumol, 1991; Anas et al, 1996).

Conceptual Discussions on Power Supply Reliability

There are essentially two fundamental components to electric power supply reliability: adequacy of investment and supply security (Hirst and Hardly 1999; Oren, 2000) Reliability of supply is essential since electricity is supplied as it is being produced (Hirst and Hardly; Jamasb, et al, 2005; Brennan, 2007).

Electricity supply reliability is an important component of government energy policy today for a number of reasons. Electricity is essential to the operation of the economy and the society at large. It is a product that cannot be stored and as such it is exposed to vulnerabilities to imbalances between supply and demand and lastly its supply depends on the use of robust transmission system (Brennan, 2007). At any point the demand outstrip supply or when there is system disruption there is black out which imposes significant costs to the electricity consumers and the economy. Consequently ensuring electricity supply reliability /security has become a pivotal policy thrust of most government across the globe. We are witnesses to the recent supply disruption in California in 2000/2001, and North-Eastern US and Ontario, 2003 (Brennan, 2007), London, Denmark/Sweden and Italy in 2003 (Meade, 2005). According to the International Energy Agency, (2002) security of electricity supply simply depends on the adequacy of investment in terms of providing enough generating capacity to meet demand. Private investments are seen as quick and relatively easy solution to perennial power supply constraints and a means to upgrade industry benchmark in an SOE dominated industry where inefficiency are the dominant operating feature of the industry (APEC, 1997 ; Gratwick and Eberhard, 2007). Private investment therefore is expected to lead to power supply reliability (Gratwick and Eberhard, 2007) and the means of ensuring the *lights stay* on (Meade, 2005, p1) all the time.

Theoretical Background

The work is structured on the theory of contestable markets. The theory is a generalization of the ideals of the perfectly competitive market characterised by free entry and free exit. Though the market is compatible with economies of scale the fact that there is potential for entry into the market makes incumbent to behave competitively (Baumol and Lee, 1991). The introduction of contestable markets eliminates the opportunity for excessive or monopolistic prices or profits. According to Baumol and Lee, (1991) even a pure monopolist operating in this market cannot generate excessive return on its capital in the long run because any excessive profit inevitably attracts potential new entrants into the market as there is no sunk costs. The market reduces or eliminates inefficiency or wastes especially those attributable to managerial ignorance, wrongdoing or lack of initiative, or inefficiencies related to delays in the introduction of technological innovations or improvement. A contestable market also cuts predatory pricing, and monopoly power in the market (Baumol and Lee, 1991).

The market contestability theory is applied to explain the cause of inefficiency in the infrastructure sector of the developing countries and their remedies. It has been observed (Lee and Anas,1989; Ajayi, 1995; Adenikinju,2005) in Nigeria and in many developing countries including , state owned utilities (monopolies) with huge capital investment fail to deliver adequate infrastructural services such as electricity, water and telecommunication. Such inadequate supply of infrastructure imposes significant cost on the industrial sector of such economies. The costs incurred are in the form of acquisition and maintenance of expensive generating equipment for self provision of electricity to overcome such deficiency, disruption in production, raw material wastages among others (Lee and Anas, 1989; Ajayi, 1995; Adenikinju,2005). According to Baumol and Lee, (1991) the best way to reverse the ugly trend is for Nigeria to create incentive for the private sector participation through dismantling of the regulatory structures that prohibits the entry of the private sector into the electricity industry. Such regulatory changes will help to create a contestable electricity market. Thus encouraging private sector participation could help to get the industry out of its current doldrums characterised by X-inefficiency. Under the new arrangement the role of the government can be redefined to that of enacting regulation and appropriate monitoring and supervision of market operations, with little or no provision of such services by the public sector.

METHODOLOGY

The study is a survey of business firms in the three industrial clusters of Nigeria. Questionnaire instrument was used to gather firm level data from the manufacturing sector of the Nigerian economy. The choice of the manufacturing sector was informed by the fact that the bulk of the costs of poor and unreliable

electricity is born by the manufacturing firms, which have to go to considerable expense to overcome these deficiencies as reported by Lee and Anas, 1989 and Adenikinju, 2005. Responding firms were selected through stratified random sampling in the three industrial centres of the country i.e. Lagos, Onitsha and Kano industrial centres. About 150 questionnaires were distributed as follows: Lagos/Ibadan axis 90, Onitsha/ Aba axis 30 and Kano /Kaduna axis 30 reflecting the density of industrial distribution in the country. Lagos got the highest allocation because it is considered as the hub of manufacturing activity in Nigeria (MAN, 1994, 2003; Dutse, 2013). In all about 98 questionnaires were returned representing about 65% of the questionnaire distributed. 9 questionnaires were found to be defective and were therefore discarded. About 81 questionnaires were entered into the data filed. Prior to the data analysis and hypothesis testing, descriptive statistics were employed to ensure that the data comply with the relevant assumption of regressions analysis such as data normality, sample size adequacy, linearity and homoscedacity, as suggested by Hair et al, (2006); Tabachnik and Fidde, (2007) Pallant, (2011) among others. Figures 1, 2 and 3 graphically depict the assumptions of the regressions analysis met by the data.

Figure 1: Histogram

Figure 2: Normal PP Plot

Figure 3: Scatter Plot

Data Analysis and Hypothesis Testing

Simple linear regression was employed for data analysis and hypothesis testing Table 1 presents the model summary which depicts the r value. The table shows that the model explain about 33% of variation in the dependent variable PSR. In other words a 1% increase in the independent variable (PF) will cause a 33% variation in the DV (PSR).

Table 1: Model Summary

Model Summary ^b				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.330 ^a	.109	.097	.54910

a. Predictors: (Constant), PF

b. Dependent Variable: PSR

Table 2: Analysis of Variance

ANOVA ^b						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2.654	1	2.654	8.804	.004 ^a
	Residual	21.709	72	.302		
	Total	24.363	73			

a. Predictors: (Constant), PF

b. Dependent Variable: PSR

The Analysis of Variance table shows the level of significance of the model. With a p value of .004 the influence of the IV on the DV is significant. The influence of the model on the DV is therefore statistically significant and not a mere chance.

Test of Hypotheses

The hypothesis to be tested is restated below:

Ho: Electricity sector restructuring does not have significant effect on power supply reliability in Nigeria.
H₁: Electricity Sector restructuring in electricity generation significantly impacts on power supply reliability. The model has an r value of .330 and a p value of .004 as shown in tables 1 and 2.

Decision Rule

Reject Ho if $p < 0.05$

Accept Ho if $p > 0.05$.

Going by the decision therefore the null hypothesis which states that Electricity sector restructuring does not have significant effect on power supply reliability is rejected and the alternate hypothesis which states that Electricity sector restructuring have significant impact on power supply reliability in Nigeria is accepted.

Discussions of Findings

The findings indicate the positive impact of electricity sector on power supply reliability in the Nigerian electricity supply industry. The findings of this paper conforms with the views of Adoghe et al, (2009) who opined that introducing deregulatory reforms in the Nigerian electricity supply industry will facilitate private sector in the financing of electricity infrastructure and consequently power supply reliability which could expand access and providing reliable and affordable electricity that could promote economic development. The result also tallies with the work of Baumol and Lee (1991) who applied the contestable market theory to demonstrate the realization of electricity supply reliability in NESI through the introduction of private investment that could lead to enhanced competitiveness in the industry. The findings also agree with APEC,(1997) which argue that private investments are a quick and relatively easy solution to perennial power supply constraints and a means to upgrade industry benchmark in an SOE dominated industry where inefficiency are the dominant operating feature of the industry especially in developing countries(APEC, 1997). The study's findings also supports the views of Gratwick and Eberhard(2007) who maintains that private investment leads to power supply reliability (Gratwick and Eberhard, 2007). The findings however contradicts the findings of World Bank, (2005) which found that private investment provides only about 10% of the investment needs in Africa and between 20-25% in developing countries. The findings also contrast with the views of Baker, (2011) who argue that the use of project finance which represents the vehicle through which private investors invest in electricity sector leads to externalization of risk.

THE INDICES OF BRAND-SWITCHING IN NIGERIAN MONEY DEPOSIT BANKS: CRITICAL INCIDENT (CI) REVIEW

M. E. Njoku, Michael Okara University of Agriculture, Umudike Nigeria
Chinedum Nduka, Michael Okara University of Agriculture, Umudike Nigeria
Ebere Rejoice Okocha, Evangel University Akaeze, Ebonyi State, Nigeria

ABSTRACT

The purpose of this paper is to investigate the critical incidents that characterize the interface between the service provider and the customer. The study also assessed the effects of critical incidents on the consumer behavior. The data were collected via self-administered questionnaire to customers of the banks under review in Nigeria. 120 customers were sampled using a combination of multistage and purposive sampling techniques. Data were analyzed using descriptive statistics and correlation model. The empirical finding indicates that critical incidents are more significant among other variables that influences brand-switching. Customers in the service industry accommodate negative critical incidents from service-providers to a level of elasticity before brand-switching can take place. It was also found out that there is a significant positive relationship between negative critical incidents technique and brand-switching. The study therefore recommends that service providers should consciously create positive critical incidents that will increase customers' expectation/loyalty. The value of the study would offer solution to customer brand switching behavior by avoiding any brand damaging behavior.

KEYWORDS: Critical Incident Technique [CIT], Switching Behaviour, Brand Loyalty, Brand Switching and Customer Satisfaction.

INTRODUCTION

In the present competitive Global market, consumers or the customers are regarded as a valuable assets for any vision – oriented organization. Research has shown that organizations are increasingly focusing on the retention of their existing customers. Thus gaining knowledge about customers' switching behaviors is substantively important for the sustainability for any organization. Since consumers are the ultimate end users of any product or services, the success of any organization depends upon the satisfaction of the customer. If not they are liable to switch to other brands. Interestingly, it has been shown that although customers may express their satisfaction, they nevertheless frequently seem to switch brand. Liyander et al (1998). Service providers today are largely concerned with attracting and retaining customers. Therefore, there is an increasing need to understand the customers switching path and why they switch to other brands. According to Van and Verhoef (2008), switching path consist of a sequence of various combination of critical encounters or events leading to a switching decision; thus, the switching process starts with the customers awareness of some negative aspect in the decision, although a complete absence of such negative incidence is impossible, the possible impact of these negative perceptions has led to some service or product failures. Critical incidence however addresses in empirical terms (from observations and practical experience) how incidences are related to the customers' overall satisfaction or dissatisfaction. However it is assumed that a negative incidence has a negative impact on consumer behaviors and that a positive incidence has a positive impact on both consumer behavior and their overall satisfaction. Gremler, (2004).

Statement of Problem

The fundamental problem in predicting the customer choices exist in the fact that brand switching decision of the customers are solely made on the bases of several different criteria simultaneously, which includes

factors like brand image, features, services quality and price e.t.c. thus, the frequent switching behaviors of customers has compelled to review such factors that affect the service industry, besides the problem has been more compounded in the service industry where customers get attracted towards the competitors offering especially when their expectation do not meet with their perception. Also, the unprecedented rough interface between services providers and consumers/ customers creates both communication as well as a relational gap, while most time it is critical enough to make a switch. As already indicated, the main concern in this paper was how critical incident can contribute to the overall satisfaction or dissatisfaction of customers to a given product. The marketer faces different type of new Trier which includes loyal users of another brand and users who frequently switch brands. However, managing customers especially those who frequently switch brands must be understood in other to avoid incidents that could dissatisfy their switching behavior. A critical incident is (by definition) one particular historic event which from the customers' point of view was particularly satisfying or dissatisfying in the customer's relationship with the service provider. Therefore this research has analyzed the power of critical incident on switching behavior of customer among other factors.

Research Objectives

The main objective of this study was to determine the effect of critical incidence on brand switching; while the specific objective of this study was to:

Measure the socio – Economic characteristic of respondent.

Measure the relationship between negative incidents and brand switching.

Measures the significance of critical incidents among other factors that causes brand switching.

Make recommendation based on research findings.

Research Hypothesis

The following hypothesis was tested in the course of this study.

H01 There is no positive relationship between critical incidents and consumer brand switching behaviour

Ho2 Critical incident is not a significant factor that influences brand switching behavior.

LITERATURE REVIEW

A critical incident is by definition one particular historic event which from the customer's point of view was satisfying or dissatisfying in the customer's relationship with a supplier interaction (Gremler, 2004). According to Edvardsson, and Strandik (2000), the main (implicit) assumption behind the interest in critical incidence in service research is that they may induce change in customers-supplier relationship. In more general terms, it seems clear that one single encounter in one's life can indeed have a lasting effect on one & sometimes even branch into new discovery of life (Banduura, 1983). Roos, (2000), opined tCritical incident is an extraordinary event which are perceived or recalled negatively by customers before, during purchase or after consumption. Flangan, (1954) first used the term critical incidence technique by labeling a set of observational procedures for human behavior as critical incidence. Flangan (1954) defined Critical Incident Technique a The critical incidents technique can be defined as a set of procedures for systematically identifying behaviours that contribute to success or failure of individuals or organizations in specific situations.

Bitner, and Tetreault (1990) described such an incident as critical when contributing either positively or negatively to an activity. Focusing on negative incidence as defined by Roos (2000), a negatively changed buying behavior can be triggered by these incidents. This would mean that companies lose operating efficiencies & future revenue stream as a result of customers who reduce their spending & purchase frequency, purchase at a discount price or switch to another supplier. Since customer satisfaction emerged

as a silent topic in marketing during the later part of the 1980s, researcher has made many attempts to identify determinant of satisfactions in empirical terms. Several methods have been employed in these efforts and the critical incident technique has become a popular method particularly in service research industry (Gremmler, 2004). The typical application is to: ask customers to provide a qualitative account of one particular incidence (i.e. a very satisfying or dissatisfying incident) in relation to a supplier, also the researcher classifies the resulting stories in categories reflecting different causes to dissatisfaction. It is assumed that such incident are critical not only in the sense that they can be recalled by the customers but the main rationale behind the critical incident is that it appears to induce change in the customer - supplier relationship (Edvardsson and Strandik 2000). In more general terms, it seems clear that no single encounter in one's life can indeed have a lasting effect (Bandura, 1982) However, it seems clear that most critical incident researchers assume that a negative incident has a negative impact on overall satisfaction and that a positive incident has a positive impact on overall satisfaction. Thus critical incident researcher addressed how such incident are related to customers overall satisfaction (Edvardsson and Strandik, 2000). This customer's satisfaction is a key to every company wishing to increase the value of customer assets and create a better business performance. To increase the value of customer asset, customer satisfaction should be measured and managed

METHODOLOGY

Study Area: This study was carried out in Abia State in the South-Eastern Nigeria. Abia state is one of the five states that made up Eastern Nigeria.

Method of Data Collection and Analysis: Multi-Stage sampling techniques were employed in the selection of location and respondents. In the first stage, three banks in Umuahia were chosen purposively for this study due to its metropolitan nature. The second stage involved a random selection of 120 respondents from the three banks. The sample population is the average customers of the bank which was selected randomly. Data were collected through a self administered questionnaire and analyzed using descriptive and inferential statistics

	Critical incident	Correlation Coefficient	.063	1.000
		Sig. (2-tailed)	.665	
	N	50	50	

**significant at 0.05

DISCUSSION OF RESULT

From figure 1 above, 48 respondents representing 40% indicated that to a very high extent, critical incidents influence their choice of brand switching. In the bar chart, has the tallest very high extent bar. This shows the criticality of critical incidents. Also, figure 2 analyzes the critical incident behavior of respondents which reveals that 44% of respondent always brand- switch at the instance of negative incidents. There is also an indication that accumulated negative incidents must be inelastic before a brandswitching can occur.

H01: There is no positive relationship between critical incidents and consumer brands witching behaviour The correlation model in figure 3 above shows that with coefficient of the correlation model which is 0.063, there is a strong positive relationship between critical incidents and brand-switching.

CONCLUSION

After the empirical study, the following conclusions were drawn based on the findings: Socio-economic characteristics of respondents do not have any relationship with critical incident. Brand-switching is a function of many factors among which critical incident is the most significant. Also, a repeated negative incident from customers’ viewpoint is judged critical at the level of elasticity. It is at the level when a

repeated rough interface (critical incidents) leads to brand-switching. There is a positive strong relationship between critical incident and brand-switching.

RECOMMENDATION

This researcher in this research makes the following recommendations

That employers and staff in the service sector should consciously create positive incident incidents that will increase customer satisfaction.

Customers should be educated on how and where to present their complaints

That the employers of labor should also embrace customer- relationship management which could dissolve the intentions of brandswitching. Etc.

RESUMEN

En los últimos años han surgido diferentes conceptos de iniciativas de mejora que prometen tener resultados mediante un desempeño superior y una creación de valor para la organización, es por ello que se ha incrementado el interés por estudiar el proceso de implantación de las estrategias en las organizaciones. Esto conlleva a las empresas a alinear sus estrategias con los indicadores de desempeño; sin embargo existe en la literatura muy poca información sobre como optimizar modelos correlacionales, es decir, modelos que involucren a varias variables al mismo tiempo. El propósito principal de este trabajo es por un lado encontrar los pesos correspondientes para la construcción del modelo matemático y por otra parte realizar una comparación de los resultados obtenidos al aplicar técnicas estadísticas multivariantes para la construcción del modelo correlacional antes mencionado y los resultados obtenidos del proceso analítico jerárquico, con la finalidad de validar el modelo, el cual mide el desempeño corporativo en industrias del sector manufacturero. La aplicación del proceso analítico jerárquico es posible gracias al uso del Método Delphi con la participación de expertos en empresas manufactureras.

PALABRAS CLAVE: Método Delphi, Proceso de Jerarquía Analítica (AHP), Técnicas de Estadística Multivariante

EMPIRICAL STUDY FOR THE VALIDATION OF A MATHEMATICAL MODEL TO MEASURE CORPORATE PERFORMANCE IN MANUFACTURING

ABSTRACT

In recent years there have been various concepts of improvement initiatives that promise to have results through superior performance and create value for the organization, which is why we have increased the interest in studying the process of implementation of strategies in organizations. This leads companies to align their strategies with the performance indicators; However in the literature there is little information on how to optimize correlational models, ie models involving multiple variables simultaneously. The main purpose of this paper is on the one hand finding the corresponding weights for the construction of the mathematical model and secondly a comparison of the results obtained by applying multivariate statistical techniques for the construction of the aforementioned correlation model and the results of the process analytic hierarchy, in order to validate the model, which measures corporate performance in the manufacturing industries. The application of the analytic hierarchy process is possible using the Delphi method with the participation of experts in manufacturing companies.

INTRODUCCIÓN

El Proceso Analítico Jerárquico fue desarrollado durante los años setentas en la Universidad de Pennsylvania por el Dr. Thomas L. Saaty, al buscar elaborar un instrumento formal para la evaluación y selección de alternativas, que tuviera las características de ser sólido en sus fundamentos matemáticos, útil en la toma de decisiones y sencillo en su aplicación. Es una de las técnicas multicriterio con mayor implementación práctica en casi todos los ámbitos de la toma de decisiones. Sin entrar a estudiar con detalle cuáles son las causas que han motivado su gran aplicabilidad, mencionar que, entre éstas, cabe citar las mismas ideas que sugirieron su metodología, esto es: la flexibilidad de la técnica; la adecuación a numerosas situaciones reales referidas, fundamentalmente, a la selección multicriterio entre alternativas; su facilidad de uso; la posibilidad de aplicarla en decisión individual y en grupo y por último, la existencia de software amigable para su aplicación desde hace unos quince años.

Es por ello que el presente trabajo la considera como herramienta de análisis de un instrumento de medición utilizado en la generación de un modelo matemático. Dicho modelo matemático fue construido a través de algunas herramientas estadísticas multivariantes, las cuales tiene un mayor rigor matemático en su desarrollo. El objetivo del presente trabajo es hacer una comparación entre los resultados obtenidos de las técnicas estadísticas multivariantes con los resultados obtenidos del proceso analítico jerárquico, con la única finalidad de validar el modelo obtenido en estudios anteriores. Además de esta forma poder presentar una jerarquización de los factores o variables más importantes durante la medición del desempeño de una organización. Cabe mencionar que para la construcción del modelo matemático se utilizó la técnica de Balanced Scorecard; la cual es una metodología que traduce la estrategia de una organización en un arreglo comprensivo de causa-efecto de objetivos. El concepto rompe con el sistema tradicional de administración del presupuesto, que se concentra en medir medidas financieras y que poca oportunidad da de entender, si la organización se mueve o no en la dirección estratégica correcta.

El mapa de la estrategia es la representación visual de los objetivos de una organización, utilizando al menos cuatro perspectivas: la perspectiva económica, que contiene las expectativas del desempeño financiero.

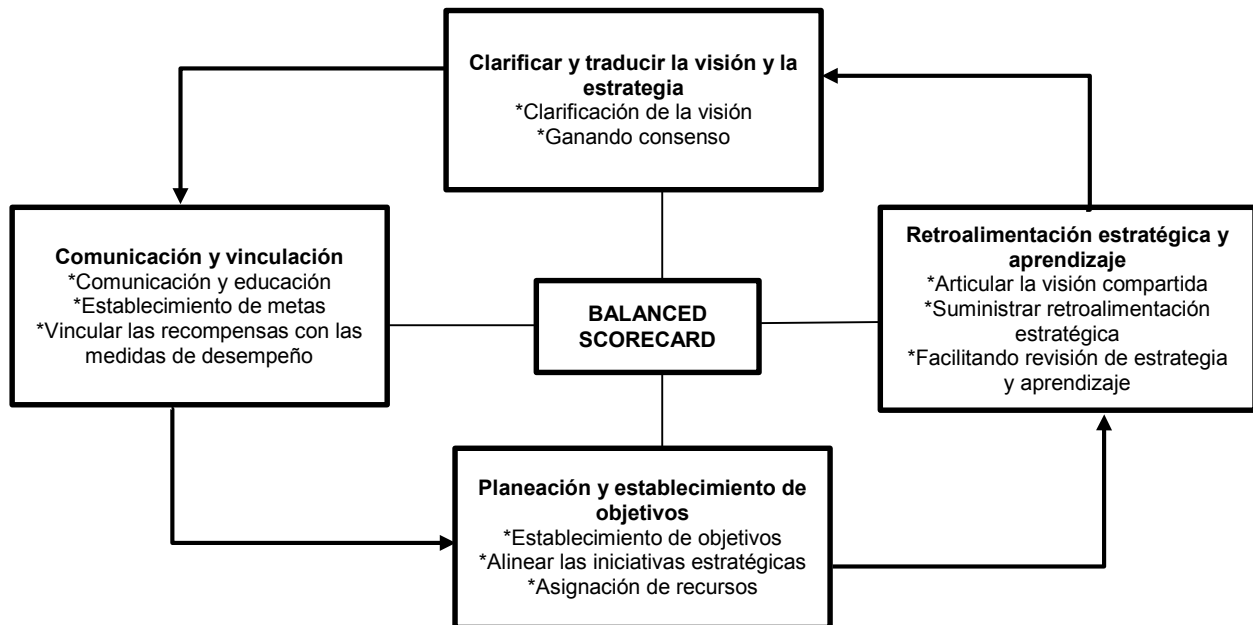

La perspectiva del cliente traduce las expectativas de los clientes en cada segmento de mercado y enfatiza los objetivos de los atributos de los productos, de servicio y de imagen. La perspectiva de procesos, que contempla los objetivos de los procesos de soporte y operativos, consistentes con los objetivos de calidad, tiempo y eficiencia para satisfacer al cliente. La perspectiva de aprendizaje y crecimiento, es decir, las capacidades y habilidades de la fuerza laboral, la inteligencia competitiva, la tecnología, las competencias, la cultura y valores que posibilitan los procesos. Dichas perspectivas agrupan a los objetivos causa-efecto para lograr materializar la estrategia a corto, mediano y largo plazo. El mapa sirve para relatar de manera comprensible como se entrelazan las hipótesis de cada perspectiva. En México existe un interés cada vez más grande por conocer y adaptar en las empresas y organizaciones la metodología del balanced scorecard; es por ello que el trabajo se centra en la validación de un modelo resultante de la aplicación de esta metodología.

REVISIÓN LITERARIA

METODOLOGÍA

Representación del Problema: Un marco estratégico propuesto por Kaplan y Norton (1996), se muestra en la figura 1, en la que las empresas innovadoras lo están utilizando como un sistema de gestión estratégica, para gestionar su plan estratégico a largo plazo.

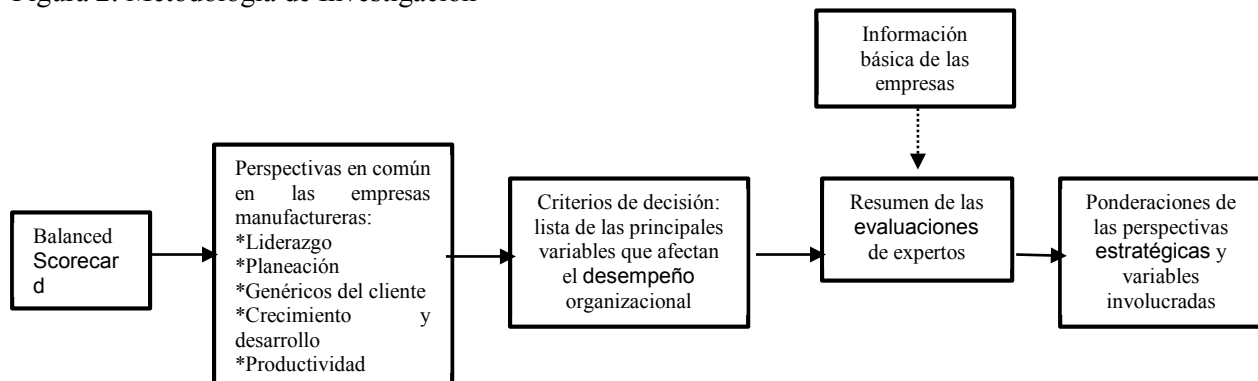

Figura 1: Marco Estratégico del Programa Balanced Scorecard

En esta figura se muestra el marco estratégico con el que trabaja la metodología de Balanced Scorecard; en el cual se tiene un círculo que contempla: la clarificación y traducción de la visión y estrategia, comunicación y vinculación, planeación y establecimiento de objetivos y retroalimentación estratégica y aprendizaje.

Se realizó un estudio previo, cuya finalidad fue encontrar las principales perspectivas estratégicas en las empresas de manufactura en la Región de Córdoba, Veracruz. Encontrándose 5 perspectivas en común. La figura 2 muestra esquemáticamente la metodología utilizada para encontrar los pesos de cada una de las variables involucradas en el estudio.

Figura 2: Metodología de Investigación

En esta figura se muestra de manera esquemática los pasos de la metodología seguida para la realización de este trabajo de investigación.

Evaluación de los Criterios de Valoración y las Alternativas

Lo que primero se realizó fue una estructura jerárquica analítica (AHP), como se muestra en la figura 3. El más alto nivel de la jerarquía se muestra en la figura 3 es el objetivo general, el segundo nivel contiene 5 objetivos incluyendo liderazgo, planeación, genéricos del cliente, crecimiento y desarrollo y productividad. Los criterios de decisión del tercer nivel son las medidas básicas de cada perspectiva del BSC en las

empresas manufactureras. Cabe mencionar que las áreas que se presentan en la figura 3 son resultado de un estudio previo de investigación, el cual tenía como objetivo desarrollar un modelo matemático que mida el desempeño corporativo en empresas manufactureras.

Escala AHP

La técnica usa la siguiente escala en el principio de “comparación por pares”

Figura 3: Escala de Saaty

En esta figura se muestra la escala utilizada dentro de la metodología del Proceso Analítico Jerárquico por los expertos para poder evaluar los criterios correspondientes.

Esta escala la estableció Thomas L. Saaty, no en forma arbitraria, sino como producto de todo un estudio de base experimental, donde se ha confirmado que una escala de nueve elementos es razonable y refleja de manera suficiente los distintos grados o niveles en los cuales una persona puede discriminar la intensidad de la relación entre elementos de un conjunto dado. De esta manera, todas las comparaciones y por ende las mediciones, cuando se usa esta técnica se hacen en la misma escala; por ello, la técnica se ajusta al principio de homogeneización de la Teoría de Mediciones, en particular, cuando se trabaja con factores o variables de gran variedad y diversidad en el estudio que se está realizando, como es éste caso. Para llenar esta matriz se debe tomar en cuenta el siguiente significado de la escala (ver tabla 1):

Tabla 1: Escala AHP

Importancia /Preferencia	Intensidad	Significado
1	Igual o diferente a...	Al comparar un elemento con otro, hay indiferencia entre ellos.
3	Ligeramente más importante o preferido que...	Al comparar un elemento con el otro, el primero es ligeramente más importante o preferido que el segundo.
5	Más importante o preferido que...	Al comparar un elemento con el otro, el primero se considera más importante o preferido que el segundo
7	Mucho más importante o preferido que...	Al comparar un elemento con el otro, el primero se considera mucho más importante o preferido que el segundo.
9	Absolutamente o muchísimo más importante o preferido que...	Al comparar un elemento con el otro, el primero se considera absolutamente o muchísimo más importante que el segundo.

La tabla presenta la escala con su respectiva interpretación de intensidad y significado correspondiente dentro de la metodología del Proceso Analítico Jerárquico. Esto permitirá entender la matriz por pares que llenen los expertos de las empresas manufactureras.

Los valores (pares) 2, 4, 6 y 8; se utilizan cuando al comparar dos elementos entre sí, el primero está en un grado de importancia/preferencia intermedio entre dos valores adyacentes de la escala. Para el caso de los valores recíprocos de la escala, la interpretación es completamente análoga, esto es:

El Método Delphi

El Método Delphi es un método de decisión en grupo desarrollado por Dalkey y Halmer (1963) en la Fuerza Aérea de los Estados Unidos. La técnica requiere que el cuestionario se repita de forma individual por los participantes que están involucrados de forma directa en el conflicto, a los que se les llama expertos. Es un proceso de respuestas anónimas para obtener de cada participante/experto la retroalimentación de la evaluación en un tema específico. La metodología usualmente toma entre 2 a 5 rounds antes de llegar a un consenso de los resultados globales.

Figura 4: Estructura Jerárquica de AHP

Nivel 1 Objetivo General	Nivel 2 Objetivos/ Factores	Nivel 3 Criterios de Decisión /Medidas de Desempeño
Ponderaciones de las perspectivas estratégicas y variables involucradas	Liderazgo	Generación de la estrategia Investigación de expectativas Cumplimiento de planeación estratégica Proyectos alineados con la estrategia Órdenes recibidas Rendimiento del proceso Juntas de planeación estratégica Proyectos exitosos Búsqueda de nuevos clientes y mercado
	Planeación	Servicio postventa Percepción del cliente sobre el producto Rapidez de entrega Iniciativa de los empleados Adquisición de clientes Retención de clientes Satisfacción de clientes
	Genéricos del cliente	Quejas de clientes Base de perfiles de clientes Devolución de productos Trabajo en equipo Ejecutivos involucrados en BSC Alineación de objetivos con BSC
	Crecimiento y desarrollo	Sensibilidad de empleados Incentivos a equipos de trabajo Salarios adecuados Rotación de personal Desperdicio del proceso Análisis y recepción de materia prima Productividad Tiempo de ciclo Producto no conforme
	Productividad	Eficiencia del proceso Re-trabajos Procesos bajo control estadístico Análisis ABC Herramientas adecuadas Puntualidad y asistencia

Tabla 2: Continuación Escala AHP

Importancia /Preferencia	Intensidad	Significado
1/3	Ligeramente menos importante o preferido que...	Al comparar un elemento con el otro, el primero se considera ligeramente menos importante o preferido que el segundo.
1/5	Menos importante o preferido que...	Al comparar un elemento con el otro, el primero se considera menos importante o preferido que el segundo.
1/7	Mucho menos importante o preferido que...	Al comparar un elemento con el otro, el primero se considera mucho menos importante o preferido que el segundo.
1/9	Absolutamente o muchísimo menos importante o preferido que...	Al comparar un elemento con el otro, el primero se considera absolutamente o muchísimo menos importante o preferido que el segundo.

Los valores $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{6}$, $\frac{1}{8}$, se usan de la misma forma que 2, 4, 6 y 8. La tabla presenta la escala con su respectiva interpretación de intensidad y significado correspondiente dentro de la metodología del Proceso Analítico Jerárquico para los valores recíprocos. Esto permitirá entender la matriz por pares que llenen los expertos de las empresas manufactureras.

Estimación de los Pesos Para la Ecuación de Evaluación de Desempeño Corporativo

La ecuación resultante del estudio mencionado anteriormente, se muestra a continuación:

$$IGDC = \sum_{k=1}^5 w_k IPD_k$$

En donde w_k representa al correspondiente factor de ponderación del indicador parcial de desempeño IPD_k . La finalidad de este trabajo es encontrar dichos pesos para tener la ecuación de desempeño corporativo completa.

RESULTADOS

En el estudio se decidió utilizar 2 rondas, todos los participantes son expertos en empresas manufactureras de la zona Córdoba, Veracruz. Esto se replicó para cada una de las 5 áreas resultantes. Después de haber completado dos rondas de la encuesta, las calificaciones de los juicios individuales evaluadas por 5 participantes, se presentan en la tabla 3.

Tabla 3: Resumen de Pesos de Factores

Factor/ objetivo	Peso
Liderazgo	0.38931698
Planeación	0.12464758
Genéricos del cliente	0.16495624
Crecimiento y desarrollo	0.12591271
Productividad	0.19516648

Los valores $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{6}$, $\frac{1}{8}$, se usan de la misma forma que 2, 4, 6 y 8. La tabla presenta los valores obtenidos por los expertos de empresas manufactureras, los cuales evaluaron las cinco áreas principales en las empresas, encontrando los pesos mostrados en la tabla. Donde se aprecia que el de mayor peso es liderazgo seguido de productividad.

Con la finalidad de validar los resultados obtenidos de los jueces o expertos en el área, se realizó una prueba de consistencia de los jueces. Dicha prueba está basada en el índice de consistencia (CI) dado por la fórmula:

$$CI = \frac{\lambda_{max} - n}{n - 1}$$

En la literatura se tiene el criterio de aceptación que si CR es menor o igual que 0.10, la consistencia se considera adecuada; sin embargo Alonso y Lamata (2006) realizaron una investigación científica para desarrollar un nuevo criterio de decisión para la aceptación o rechazo en la prueba de hipótesis para medir la consistencia en el AHP. Basándose en este estudio, se calculó el valor de λ_{max} , el cual dio como resultado 5.208, por lo que se concluyó que la consistencia de la matriz por pares es adecuada. Con esto es posible completar la ecuación IGDC, quedando de la siguiente manera:

$$IGDC = 0.39052 IPD_1 + 0.1248 IPD_2 + 0.1655 IPD_3 + 0.1261 IPD_4 + 0.1994 IPD_5$$

Comparación de los Pesos Obtenidos Por ACP Y AHP Para Cada Área U Objetivo

Por otro lado, también se tenía el interés de comparar los resultados obtenidos de la aplicación de Análisis de Componentes Principales (ACP) con los obtenidos de la aplicación de AHP, la tabla 4 muestra los resultados obtenidos de ambas técnicas.

Tabla 4: Comparación de Pesos Obtenidos Para Criterios de Decisión

Nivel 1	Nivel 2	Nivel 3	PESO AHP	CARGA FACTORIAL
OBJETIVO GENERAL	OBJETIVO	CRITERIO DE DECISION		ACP
Ponderaciones de las perspectivas estratégicas y variables involucradas	Liderazgo	1 generación de la estrategia	0.16137309	0.555*
		2 investigación de expectativas	0.3713829	0.521*

		35 análisis ABC	0.08875788	0.271*
		36 herramientas adecuadas	0.12014209	0.271*
		37 puntualidad y asistencia	0.06725095	0.271*

*significativo al 5%. La tabla muestra los componentes de la técnica de Proceso Analítico Jerárquico; el objetivo principal de la aplicación de la técnica es determinar las ponderaciones de las perspectivas estratégicas y variables involucradas; los cinco objetivos que son las áreas relevantes en las empresas manufactureras y finalmente los criterios de decisión, que son los indicadores individuales por área empresarial. Las últimas columnas muestran los resultados de las ponderaciones del proceso y su comparación con los resultados obtenidos a través del Análisis de Componentes Principales.

CONCLUSIONES

El Proceso de Jerarquía Analítica (AHP) es un método sencillo en su aplicación que permitió en este trabajo de investigación encontrar por un lado, las ponderaciones o pesos correspondientes a cada bloque de la ecuación de desempeño corporativo en empresas manufactureras. Así al aplicarla a cada uno de los 5 bloques (objetivos) de la ecuación de manera independiente, se encontró que las variables involucradas (criterios de decisión) tienen el mismo orden jerárquico que las cargas factoriales obtenidas con el Análisis de Componentes Principales (ACP). Lo cual conlleva a la validación del modelo matemático determinado con anterioridad (obtenido por Díaz, 2014). Los investigadores interesados en continuar nuestra investigación podrían concentrarse en la generación de una ecuación estructural obtenido exclusivamente con el uso de la metodología de jerarquía analítica.

LA GESTION DE LA CADENA DE SUMINISTRO: ELEMENTO CLAVE PARA EL RENDIMIENTO DE LA PYME MANUFACTURERA

Luis Aguilera Enríquez, Universidad Autónoma de Aguascalientes
Octavio Hernández Castorena, Universidad Autónoma de Aguascalientes
Martha González Adame, Universidad Autónoma de Aguascalientes

RESUMEN

Los resultados obtenidos en el presente trabajo de investigación, confirman que actualmente para la Pyme manufacturera por la naturaleza de sus actividades operativas, el manejo de la Gestión de la Cadena de Suministro (GCS), incide de manera significativa en el Rendimiento de este tipo de organizaciones. Para ello, se analizaron las respuestas que los empresarios con apoyo de una encuesta a través de un trabajo de campo han generado, encontrándose que para ellos, es esencial que la GCS considerando su complejidad y su impacto en el suministro de los recursos materiales, incide de manera significativa para que la Pyme manufacturera tenga un mayor rendimiento. La presente investigación, de carácter empírico, y con apoyo del paquete estadístico EQS donde se ha utilizado la técnica de ecuaciones estructurales, permite concluir que la GCS es un elemento clave para el Rendimiento de la Pyme manufacturera. Para esta investigación se ha utilizado una muestra estratificada de 288 empresas del estado de Aguascalientes obtenida entre agosto y diciembre del 2013, las cuales contienen entre 11 a 250 trabajadores.

PALABRAS CLAVES: Gestión de la Cadena de Suministro, Rendimiento, Pyme Manufacturera

THE MANAGEMENT OF THE SUPPLY CHAIN: A KEY ELEMENT FOR PERFORMANCE MANUFACTURING SMEs

ABSTRACT

The results of the present investigation confirm that currently manufacturing for SMEs by the nature of its operational activities, management Management Supply Chain (SCM), significantly affects the performance of such organizations. To do this, the responses of entrepreneurs supported by a survey through a field generated were analyzed and found to be for them, it is essential that the GCS considering its complexity and its impact on the supply of material resources, impacts significantly to the manufacturing SMEs have a higher yield. The present research, empirical, and with support from EQS statistical package which has used the technique of structural equation leads to the conclusion that the SCM is a key to the performance of manufacturing SMEs item. For this investigation we used a stratified sample of 288 companies in the state of Aguascalientes obtained between August and December 2013, which contain 11 to 250 employees.

INTRODUCCION

Hoy en día, las empresas como la Pequeña y mediana empresa (Pyme), manufacturera crean alianzas y redes apoyándose en la Gestión de la Cadena de Suministro (GCS), en donde el manejo y suministro de los recursos materiales en este tipo de organizaciones es una actividad importante a controlar (Dyer, Sung y

Chu, 1998). Para ello, la GCS por su importancia, relación y conexión que tenga con la fuente de suministro, pretende con su gestión ser elemento clave para mejorar el rendimiento en las empresas manufactureras (Dyer *et al.*, 1998). En este sentido, es importante que los empresarios, tengan una especial atención en la GCS con la finalidad de evitar al máximo las fallas que estén relacionadas con el suministro de los recursos materiales (Wisner, 2003). Es relevante resaltar que la GCS es un conjunto de actividades que incluyen la compra, la fabricación y la entrega de los recursos materiales en tiempo (Mujuni y Zheng, 2010). Considerando que hoy en día para la Pyme manufacturera, el control del suministro es vital para el desarrollo de las empresas, el presente trabajo de investigación tiene como objetivo el analizar el impacto que tiene la GCS en el Rendimiento en este tipo de organizaciones, y en este sentido, es conveniente profundizar en la siguiente pregunta: ¿la actividad que desarrolla la GCS en la Pyme manufacturera, permite que estas, tengan un mayor rendimiento? El presente estudio, esta formado en una primera parte por la introducción y materiales; en una segunda parte, el metodo y los análisis estadísticos y finalmente, por los resultados, conclusión y limitaciones del presente estudio.

Materiales y Metodos

Gestión de la Cadena de Suministro

En la actualidad, la GCS como actividad operativa necesaria para la Pyme manufacturera, se ha convertido en elemento importante para las organizaciones y en este sentido, y tal como lo señala Beamon, (1998), es un proceso estructurado donde los recursos materiales se transforman en productos terminados, para luego ser entregados al cliente final en tiempo y en las cantidades requeridas. Asi mismo, Trkman, Stemberger y Jaklic, (2005), definen la GCS como "una cadena a partir de materias primas y terminando con la venta del producto terminado". Por otro lado, Pienaar (2009) define la GCS como "una descripción general de la integración de procesos de participación organizaciones para transformar materias primas en productos terminados y para transportarlos a los usuarios finales".

El concepto de GCS, suele estar vinculada con los aspectos operativos y en especial por la dinámica de los fabricantes con la finalidad de obtener los insumos sin ningún riesgo (Wisner, 2003). Y teniendo como referencia que la competencia en los mercados internacionales depende de las entregas de las mercancías, la coordinación entre las fuentes de suministro y los distribuidores involucrados en el flujo de los recursos materiales, esta dinámica operativa se ha convertido en una característica importante por lo que la satisfacción del cliente es un punto de referencia crucial del éxito de la GCS (Trkman *et al.*, 2005). Es importante resaltar que la incertidumbre del mercado requiere de una GCS eficaz y flexible a los cambios que se presentan en toda dinámica de negocios lo cual impacta de tener buenos resultados, de manera significativa en el desarrollo de la Pyme manufacturera (Langley, Coyle, Gibson, Novack y Bardí, 2008).

Rendimiento

En la actualidad, para las organizaciones en general, el Rendimiento es un concepto que contiene de manera natural en su significado el análisis y control de los recursos desde un punto de vista de inversión (Harold y Darlene, 2004; Kaplan y Norton, 1993; Rajendar y Jun Ma, 2005); sin embargo, es importante resaltar que, dentro del concepto y aplicaciones del rendimiento no esta exento el integrar aspectos como lo es la productividad y los resultados que deben cotejarse con el planteamiento de objetivos y con las metas propuestas de manera sustancial en las organizaciones cuyo fin es tener mejor desempeño en las organizaciones (Aguilera y González, 2012). Y para ello, es importante que las empresas tengan presente que debe integrarse en sus estrategias de mejora y rendimiento trabajar fuertemente con aspectos de capacitación, habilidades directivas y mejores actitudes en la gestión del rendimiento (Richard, 2002).

Es importante resaltar que dentro de la complejidad que tiene el concepto de rendimiento, Houthoofd (2009) asi como Slater y Olson (2000), resaltan que el rendimiento tiene un vínculo especial con la parte económica

que toda empresa requiere controlar y administrar la cual tiene por naturaleza una fuerte incidencia en el éxito y eficiencia de las organizaciones para que su participación en los mercados le permita a las empresas tener mayor desarrollo y rendimiento. Y para ello, es importante mencionar que todas las empresas dentro de su desarrollo organizacional requieren de analizar a detalle aquellos factores que les permita tener mejoras significativas para que los resultados finales de aquellas estrategias que se hayan implementado en sus organizaciones tengan resultados que impacten en el cumplimiento de las metas que sean de interés en el rendimiento de las organizaciones (Quinn y Rohrbaugh, 1983).

Gestión de la Cadena de Suministro y el Rendimiento de la Pyme Manufacturera

Hoy en día, para la Pyme manufacturera, es necesario que los empresarios se enfoquen en mejorar los sistemas de suministro con la finalidad de eficientar las entregas así como el manejo de los materiales para áreas como los procesos de producción, tengan los materiales a tiempo y sin problemas de calidad lo que conlleva a que la gestión con la proveeduría sea eficaz y de mucha coordinación en el aspecto del suministro (Cachon y Netessine, 2004), y en este sentido, la GCS integra para la mejora de estas gestiones el manejo de la información, el control de inventarios, contar con un buen control del almacén, mejor gestión con el transporte y un flujo de los recursos materiales eficiente (Cruz, 2008; Stadler, 2005), lo que permitiría que este tipo de organizaciones tengan un mayor rendimiento.

Para las empresas como la Pyme manufacturera y acorde a los señalamientos de Chow, y Heaver, (1999), la GCS se conforma por un grupo de fabricantes, proveedores, distribuidores, minoristas y transportistas, donde la información y la relación con las fuentes de suministro, los servicios de gestión logística dedicados a la provisión de bienes a los consumidores permiten a las empresa tener un mayor rendimiento. En este sentido, la GCS se integra por diversos actores quienes están directamente involucrados en diversas actividades relacionadas con el manejo y flujo de los recursos materiales, por lo que esta actividad por naturaleza, es un proceso relacionado con los suministros, el manejo de la información y los flujos financieros, cuyo objetivo es satisfacer requisitos que requieren los consumidores finales al ofrecer a ellos, productos suministros a tiempo y con ello evitar problemas en las entregas (Aguilera, Hernández y López, 2012; Ayers, 2001).

H₁: La Gestión de la Cadena de Suministro permite en la Pyme Manufacturera un mayor Rendimiento

MÉTODOS

En el presente trabajo de investigación, se analiza si la GCS es un elemento clave para el Rendimiento de la Pyme Manufacturera y para ello, se tomó como referencia los datos de Inegi (2009) donde se muestra que en el estado de Aguascalientes, se tiene el registro de 442 empresas Pyme del sector manufacturero las cuales tienen entre 11 y 250 trabajadores. El trabajo es de carácter empírico, exploratorio y correlacional en el cual se tomaron como muestra los datos de 288 Pymes del sector de manufactura a quienes se les aplicó un instrumento de medición tipo encuesta personalizada para los gerentes o dueños de este tipo de organizaciones en el periodo comprendido entre agosto y diciembre del 2013 de manera transversal y con un enfoque cuantitativo. Para la elaboración del instrumento de medición aplicado a la Pyme Manufacturera de Aguascalientes se diseñaron 2 Bloques los cuales se mencionan a continuación: Para el bloque I identificado como Gestión de la Cadena de Suministro se utilizaron 20 ítems (codificados como CS01 a CS20), los cuales están medidos con escala Likert 1-5 los cuales refieren desde poca hasta alta importancia (Wisner, 2003). Y para el bloque II, en la medición de la escala de Rendimiento se utilizaron 12 ítems (codificados como RE01 a RE12), medidos también con la escala de Likert 1-5, de Quinn y Rohrbaugh (1983), que va muy desfavorable hasta muy favorable. En la figura No.1 se muestra el modelo teórico diseñado para el presente trabajo de investigación.

CONCLUSIONES PRE-ELIMINARES

Los resultados obtenidos en la presente investigación muestran que la Pyme manufacturera en el estado de Aguascalientes, considera que la Gestión de la Cadena de Suministro (GCS), por compleja que esta sea, es un elemento esencial en la dinámica relacionada con el suministro de los recursos materiales. En este sentido, es importante que los empresarios responsables de las operaciones de este tipo de empresas, tengan presente que la relación que requieran tener con las organizaciones fuentes del suministro debe ser de estrecha colaboración y de establecer acuerdos con la finalidad de evitar al máximo las demoras en las entregas de los suministros y con ello, evitar problemas al interior de los procesos que tengan las organizaciones. Finalmente es importante resaltar que si bien los empresarios son conscientes de la importancia que tiene el control y manejo de la información relacionada con la GCS y que ello tiene un impacto positivo en el rendimiento de sus empresas, se debe profundizar aún más en el estudio de cómo mejorar la eficiencia de la GCS considerando desde luego la naturaleza de su complejidad y de los recursos materiales que la Pyme manufacturera requiere suministrarse para cumplir con los objetivos pactados con los clientes. En este sentido, es importante resaltar que las limitaciones de presente estudio se tienen la muestra obtenida, el sector analizado y el tipo de ítems que se han seleccionado para medir la GCS y el rendimiento en este tipo de organizaciones. Como futuras líneas de investigación, es importante analizar la incidencia de otros factores y sectores a estudiar para con ello determinar si aún la GCS sigue siendo elemento clave para el mayor rendimiento de la Pyme manufacturera en Aguascalientes.

LA CONTRIBUCIÓN DEL TURISMO AL CRECIMIENTO ECONÓMICO: ANÁLISIS REGIONAL DE LAS PRINCIPALES ENTIDADES FEDERATIVAS EN MÉXICO

Martín Alberto Rodríguez-Brindis, Universidad Anáhuac Oaxaca
Enrique Sánchez Flores, Universidad Anáhuac Oaxaca

RESUMEN

El turismo es una actividad económica que se considera cada vez más importante para generar crecimiento económico y combatir la pobreza. Sin embargo, la relación que existe entre el turismo y el crecimiento económico a nivel regional ha sido poco estudiada. En este artículo se presenta la metodología propuesta por Ivanov y Webster (2007) para medir la contribución del turismo al crecimiento económico y se aplicó durante el periodo 2004-2012 para las cinco Entidades Federativas con mayor atracción de turistas en México: Quintana Roo, Jalisco, Guerrero, Veracruz y Chiapas.

PALABRA CLAVE: Economía del Turismo, Crecimiento Económico, Impactos del Turismo, Turismo Doméstico

THE CONTRIBUTION OF TOURISM TO ECONOMIC GROWTH: REGIONAL ANALYSIS OF THE MAIN FEDERAL ENTITIES IN MEXICO

ABSTRACT

Tourism is an economic activity that is considered increasingly important to generate economic growth and combat poverty. However, the relationship between tourism and economic growth at the regional level has been little studied. This paper presents the methodology proposed by Ivanov and Webster (2007) to measure the contribution of tourism to economic growth and is applied during the 2004-2012 period for the five federal states attracting more tourists in Mexico: Quintana Roo, Jalisco, Guerrero, Veracruz and Chiapas.

KEYWORDS: Tourism Economics, Economic Growth, Tourism Impacts, Domestic Tourism

INTRODUCCIÓN

Durante los últimos años, México ha sido uno de los lugares favoritos para los turistas en el mundo, según datos de la Organización Mundial del Turismo, nuestro país ocupó en el 2012 el lugar número 13 a nivel mundial y número 2 en el continente americano en llegadas de turistas internacionales al recibir 23.4 millones de turistas. Las divisas por turismo para el mismo año representaron 12,700 millones de dólares, ocupando el lugar número 24 en el mundo en este rubro. Además, el turismo en México representa el 8.4% del Producto Interno Bruto nacional. En México el turismo se ha vuelto un factor determinante en el diseño de política económica y social, tanto que ha quedado plasmado en el Plan Nacional de Desarrollo 2013-2018 en su objetivo 4.11 *Aprovechar el potencial turístico de México para generar una mayor derrama económica en el país (PND 2013)*. Una de las principales razones por la que el gobierno apoya y promueve el turismo es porque este tiene un impacto positivo sobre el crecimiento y desarrollo económico. El turismo

fomenta la generación de empleo y, en la medida que logra generar eslabonamientos con los diferentes sectores económicos, podría ayudar significativamente a la reducción de la pobreza. La importancia del turismo y su contribución al crecimiento económico no es un tema nuevo. No obstante, la medición del impacto que el sector turístico tiene en el crecimiento a nivel regional ha sido poco abordado, a pesar de ser precisamente a nivel regional donde el turismo funciona como elemento dinamizador de la economía. Comprender el vínculo existente entre el sector turístico y el desarrollo económico en las regiones turísticas podría ayudar al diseño de políticas de desarrollo turístico que tengan mayor impacto para el progreso económico y la reducción de la pobreza.

El objetivo de este artículo es medir la contribución que el turismo tiene sobre el crecimiento económico de las cinco Entidades Federativas de México con mayor afluencia turística: Quintana Roo, Guerrero, Chiapas, Veracruz y Jalisco. Lo anterior es realizado utilizando la metodología propuesta por Ivanov y Webster (2007), la cual utiliza la tasa de crecimiento del PIB real per cápita como medida del crecimiento económico, el cual es desagregado por el crecimiento económico generado por el turismo y el crecimiento económico generado por otras industrias. La metodología tiene la particularidad de dar una estimación *ex post*, es decir, lo que realmente sucedió (Such et al. 2009:22).

El trabajo se ha organizado de la siguiente manera: la sección 2 presenta una breve descripción de las cinco entidades federativas analizadas, enfocándose principalmente en los principales atractivos turísticos con los que cuentan. Sección 3 presenta el marco teórico del que surge el concepto de la contribución del turismo al crecimiento económico. Sección 4 describe la metodología propuesta por Ivanov y Webster (2007) para la medición de la contribución del turismo al crecimiento económico y la manera en que deben ser interpretados los resultados obtenidos de ella. Sección 5 analiza los principales resultados encontrados y, finalmente, en la sección 6 se presentan las principales conclusiones.

Principales Entidades Federativas con Mayor Turismo En México

Para el siguiente estudio hemos seleccionado los cinco estados con mayor influencia turística en México. Según los datos obtenidos por el Instituto Nacional De Estadística y Geografía estos estados son Quintana Roo, Jalisco, Guerrero, Veracruz y Chiapas.

Quintana Roo: Ubicado en la región sureste del país, es el estado con el principal destino turístico del país: Cancún. Cancún es considerado un gran atractivo natural y la joya del caribe mexicano. Es también el destino turístico con mayor captación de divisas, representando en el 2013 el 38.9% del total de divisas que ingresaron al país (DATATUR, 2013). Quintana Roo posee además el segundo arrecife más grande del mundo, así como una gran diversidad cultural y geográfica, lo que le ha permitido posicionarse como el estado con mayor afluencia turística del país recibiendo en el 2012 un total de 9.4 millones de turistas.

Jalisco: El estado de Jalisco está ubicado al occidente de la república mexicana y su capital, la ciudad de Guadalajara, es la segunda ciudad más grande de México. A diferencia de los otros estados presentados, Jalisco es uno de los centros industriales y comerciales más importantes de México. El estado de Jalisco cuenta con un importante destino turístico de tipo playa: Puerto Vallarta, ubicado en la bahía de banderas en el océano pacífico y es uno de los tres destinos de playa más visitados del país. Jalisco ocupa el segundo lugar en atracción de turistas en el país, recibiendo en el 2012 6.6 millones de turistas.

Guerrero: Se encuentra localizado en la región suroeste del país y cuenta con el atractivo de playa más cercano de la capital mexicana: Acapulco, lo cual le permite una importante afluencia de turismo tanto local como extranjero. Acapulco es uno de los destinos turísticos más importantes del país ocupando el tercer lugar a nivel nacional en infraestructura hotelera. Al norte del estado se ubica la pequeña ciudad de Taxco que destaca como un destino de turismo cultural, siendo una de las más bellas y admiradas joyas coloniales del país. Su origen, desarrollo y apogeo se le debe a la plata; pero más aún, se le considera un Pueblo

Mágico lleno de tradición e historia. Además, en sus siete regiones, Guerrero ofrece a sus visitantes una gran diversidad de atractivos turísticos: bosques, valles, playa, cascadas y todo tipo de escenarios naturales, lo que ha llevado a ser el tercer estado del país con mayor recepción de turismo al recibir 5.7 millones de visitantes en el 2012.

Veracruz: Veracruz de Ignacio De La Llave se localiza en la costa del atlántico, en el Golfo de México. Destino principalmente atractivo por su riqueza histórica ya que fue pieza clave en la conquista del continente americano, con una superficie de 71.699 km cuadrados y alrededor de 7,3 millones de habitantes hacen de Veracruz uno de los estados con mayor número de habitantes de la República Mexicana. El puerto de Veracruz es el destino con mayor ingreso de visitantes y es cede de uno de las representaciones culturales más importante de México: “El Carnaval de Veracruz”, que en 2014 logró una derrama económica de 180 millones de pesos. Veracruz es la entidad federativa con mayor oferta de servicios de restaurantes turísticos a nivel nacional. Además, actualmente es la cuarta entidad preferida por los turistas, atrayendo al año alrededor de 5.1 millones de visitantes.

Chiapas: Para el turismo internacional, Chiapas es considerado uno de los atractivos principales a visitar en México gracias a que es un destino cultural que ofrece una gran diversidad biológica que van desde un bosque de niebla hasta la majestuosa selva tropical. Esto sin lugar a dudas posiciona al estado como una buena alternativa para el turismo nacional y extranjero. Chiapas se encuentra localizado al sur de la república mexicana y entre sus principales destinos turísticos alberga: las cascadas de agua azul, la zona arqueológica de Palenque, el majestuoso cañón del sumidero y los Lagos de Monte Bello. Lo que le ha permitido ser receptor de 3.6 millones de turistas en el 2012, colocando como el quinto estado con mayor captación de turistas en México.

La Contribución del Turismo al Crecimiento

Para medir la contribución del turismo al crecimiento económico, Ivanov y Webster (2007) proponen un método que utiliza la tasa de crecimiento del PIB real per cápita como medida del crecimiento económico de un país, este crecimiento es desagregado en un crecimiento económico generado por el turismo y el crecimiento económico generado por otras industrias. Diversos autores han utilizado esta metodología para diferentes países. Los mismos Ivanov y Webster (2007) realizan una aplicación de esta para España, Cyprus y Grecia; de manera más reciente, Ivanov y Webster (2012) usaron esta metodología con datos de 174 países para los años 2000-2010 para medir el impacto económico del turismo sobre una base país por país de manera global. Otros autores como Brida, Pereyra, Such y Zapata (2008) usaron este mismo método para aplicarlo a países como España, Francia, Italia, Reino Unido y Estados Unidos. Brida, Monterrubbianesi y Zapata (2011) para Colombia. Brida, Pereyra y Such (2007) comparan la contribución del turismo al crecimiento económico de México con Argentina, Brasil y Uruguay. Adicionalmente, Brida et al. (2011) también utilizan esta metodología para medir la contribución del turismo al crecimiento económico de Colombia comparando su resultado con el de otros países, entre ellos México. En un trabajo más reciente, Rodríguez-Brindis (2014) realiza un análisis de la contribución del turismo al crecimiento económico de México mediante una expansión de la metodología de Ivanov y Webster, permitiendo medir la contribución individual que cada una de las ramas características de este sector tiene sobre el crecimiento económico del país. Cabe mencionar que los trabajos anteriores se enfocan en medir la contribución del turismo al crecimiento económico del total del país y que ninguno de ellos analiza alguna entidad federativa o departamento en lo individual. Un trabajo existente en este sentido es el de Brida et al. (2011), quienes cuantifican la contribución del sector turismo al crecimiento económico para los departamentos de Antioquia, Bogota (Distrito Capital), Bolivar, Magdalena y San Andrés en Colombia. Es necesario mencionar que el método propuesto por Ivanov y Webster (2007) sólo nos permite medir los efectos directos que el turismo tienen sobre el PIB real per cápita, dejando de lado los posibles impactos indirectos y los efectos inducidos que estas pueden tener sobre la economía real. Lo anterior es una limitación de esta metodología en cuanto a la estimación de los impactos del turismo sobre el crecimiento económico. Como

señalan Brida et al (2008, 37) “*El aporte original del método es brindar una estimación ex post (lo que realmente sucedió) de la contribución del turismo sobre el crecimiento del PIB*”.

METODOLOGÍA Y MEDICIÓN

Como ya se mencionó, el método presentado por Ivanov y Webster (2007) utiliza la tasa de crecimiento del PIB real per cápita (g_t), como medida del crecimiento económico, que es definido de la siguiente manera:

$$g_t = \left[\left(\frac{Y_{t(P_b)}/N_t}{Y_{t-1(P_b)}/N_{t-1}} \right) - 1 \right] \quad (1)$$

Donde $Y_{t(P_b)}$ es el PIB en el periodo t a precios constantes; $Y_{t-1(P_b)}$ es el PIB a precios constantes en el periodo $t-1$; N_t y N_{t-1} son el tamaño promedio de la población en el periodo t y en el periodo $t-1$ respectivamente; el subíndice P_b representa el año base. Si se desagrega la ecuación (1) para separar el PIB turístico a precios constantes en el periodo t ($Y_{t(P_b)}^T$) del PIB de otras industrias a precios constantes para el mismo periodo ($\sum_{R \neq T} Y_{t(P_b)}^R$) y el PIB turístico a precios constantes en el periodo $t-1$ ($Y_{t-1(P_b)}^T$) del PIB de otras industrias a precios constante en el mismo periodo ($\sum_{R \neq T} Y_{t-1(P_b)}^R$) tendremos que la tasa de crecimiento del PIB real per cápita en el tiempo t es:

$$g_t = \left[\frac{\frac{Y_{t(P_b)}^T}{N_t} \frac{Y_{t-1(P_b)}^T}{N_{t-1}}}{\frac{Y_{t-1(P_b)}^T}{N_{t-1}}} + \frac{\frac{\sum_{R \neq T} Y_{t(P_b)}^R}{N_t} \frac{\sum_{R \neq T} Y_{t-1(P_b)}^R}{N_{t-1}}}{\frac{Y_{t-1(P_b)}^T}{N_{t-1}}} \right] \quad (2)$$

La primera expresión en (2) muestra la parte del crecimiento en el PIB real per cápita que es consecuencia del desarrollo turístico, i.e. “el impacto del turismo sobre el crecimiento económico” (Ivanov y Webster 2007:382), de manera aislada, este efecto quedaría definido de la siguiente manera:

$$g_t^T = \frac{\frac{Y_{t(P_b)}^T}{N_t} \frac{Y_{t-1(P_b)}^T}{N_{t-1}}}{\frac{Y_{t-1(P_b)}^T}{N_{t-1}}} \quad (3)$$

Para aplicar esta metodología se utilizaron datos del Producto Interno Bruto Estatal y de la actividad turística para los estados de Quintana Roo, Jalisco y Veracruz, la cual fue media a través de la suma de las ramas 71 *Servicios de esparcimiento culturales y deportivos, y otros servicios recreativos* y la rama 72 *Servicios de alojamiento temporal y de preparación de alimentos y bebidas* como variable Proxy del turismo obtenidos del Instituto Nacional de Estadística y Geografía (INEGI). Se han utilizado también datos de la población a mitad de año obtenidos del Consejo Nacional de Población (CONAPO).

Los resultados son presentados en la tabla 1. En esta tabla se muestran datos del crecimiento real del producto interno bruto per cápita, el crecimiento real per cápita de la actividad turística y la contribución del turismo al crecimiento económico para las cinco Entidades Federativas estudiadas. En el análisis de los resultados se pueden encontrar cuatro posibles casos y deben de ser interpretados de la siguiente manera: Primer caso: que el crecimiento en el PIB real per cápita sea positivo y la contribución del turismo a este crecimiento sea positiva, por ejemplo, tomando datos del año 2006 de la Tabla 1a, Jalisco tuvo un crecimiento real en su PIB per cápita de 4.590% de los cuales 0.079% pueden ser vinculados directamente al crecimiento de las actividades turísticas, lo que representaría un 1.72% (Este porcentaje de 1.72% del total de la tasa de crecimiento es obtenido fácilmente mediante una regla de tres, es decir,

$1.722\%=(0.079*100/4.590)$ del total de la tasa de crecimiento (Se debe de tener mucho cuidado en este punto de no confundir la contribución del turismo al crecimiento económico con el porcentaje de contribución a este crecimiento ya que ambos están expresados de alguna manera en términos porcentuales. Para evitar esta posible confusión, basta con recordar que la contribución del turismo al crecimiento económico está presentada en términos “absolutos”, mientras que el porcentaje de contribución del turismo al crecimiento económico está presentada en términos relativos.) Para el segundo caso en el que los valores son negativos el análisis es similar, si tomamos por ejemplo los datos para el 2008 en la Tabla 1a, el crecimiento en el PIB real per cápita para Jalisco fue de -0.465% de los cuales -0.025 de estos son vinculados a la caída en el sector turístico. Un tercer caso a analizar es cuando el crecimiento en el PIB real per cápita es positivo y la contribución del sector turístico es negativa, por ejemplo, el año 2010 en la Tabla 1a. el crecimiento del PIB real per cápita de Jalisco fue de 4.219% y la contribución del turismo a este crecimiento fue de -0.078%, es decir, la caída en el sector turístico durante este año causó que el crecimiento fuera -0.078% menor. Finalmente, puede darse el caso en que la variación en el crecimiento haya sido negativa y la contribución del turismo sea positiva, para comprender mejor esta situación, analicemos el año 2008 de la Tabla 1b, en el que el crecimiento del PIB real per cápita del Estado de Guerrero fue de -1.703% y la contribución del turismo a dicho crecimiento fue de 0.056%, este resultado nos muestra que, para este año, la actividad turística evitó una caída mayor en el crecimiento económico del Estado. El resto de los datos en las Tablas 1a – 1e pueden ser interpretados de manera análoga a alguno de estos cuatro casos.

Tabla 1a: Contribución del Turismo al Crecimiento: Jalisco

	2004	2005	2006	2007	2008	2009	2010	2011	2012
Var. PIB per cápita	3.229%	1.866%	4.590%	4.087%	-0.465%	-8.248%	4.219%	3.583%	2.771%
Var PIB Turístico per cápita	-5.655%	5.788%	2.253%	0.349%	-0.759%	-8.340%	-2.362%	0.375%	2.345%
Contribución del turismo al crecimiento	-0.209%	0.196%	0.079%	0.012%	-0.025%	-0.275%	-0.078%	0.012%	0.070%

RESULTADOS

El resumen de la información contenida en las Tablas 1a-1e puede apreciarse en la Figura 1. En ella puede observar la contribución que el turismo ha tenido al crecimiento económico en cada una de las Entidades Federativas Analizadas.

Figura 1: Contribución del Turismo al Crecimiento Económico: Diferentes Estados de la República Mexicana

Quintana Roo

El resumen de la contribución del Turismo al crecimiento económico de Quintana Roo puede observarse en la figura 2. Quintana Roo es el estado que presenta las mayores contribuciones del sector turismo al crecimiento económico. Por ejemplo, para el año 2007 Quintana Roo registró una tasa de crecimiento de su economía del 6.26% de la cual 5.49% es atribuible directamente a las actividades turísticas, es decir, el 73.35% del crecimiento económico se debe directamente al turismo. Este mismo Estado en el 2010 registró una tasa de crecimiento económico del 0.272% mientras que la contribución del turismo al crecimiento económico fue de 2.72%, es decir, mientras en el 2010 las actividades económicas en otros sectores de la economía de Quintana Roo caían, el sector turístico crecía de manera positiva y evitó la caída en el crecimiento económico de la entidad. Lo anterior refleja la gran importancia que el Turismo tiene en el Estado de Quintana Roo.

Figura 2: Contribución del Turismo al Crecimiento Económico de Quintana Roo

Jalisco

Jalisco es el Estado que registra, las menores contribuciones del sector turístico al crecimiento económico, aclarando que dichas contribuciones son, en general, positivas. Por ejemplo, para los años 2011 y 2012, Jalisco registró tasas de crecimiento económico de 3.58% y 2.71% respectivamente. Para dichos años la contribución del turismo a estas tasas fue de 0.012% (2011) y 0.070% (2012), (véase Figura 3). Para los años en que Jalisco registró caídas en su crecimiento económico, la contribución que el turismo tuvo a dicha caída también fue pequeña, es decir, para los años 2008 y 2009 en Jalisco tuvo una contracción económica de -0.465% y -8.248% respectivamente, de esta caída sólo es atribuible al sector turístico el -0.025% en el 2008 y el -0.275% en el 2009.

Figura 3: Contribución del Turismo al Crecimiento Económico de Jalisco

Guerrero

Los resultados para el Estado de Guerrero pueden apreciarse en la figura 4. El caso de Guerrero es muy similar al de Quintana Roo aunque en menor magnitud. Por ejemplo, para el año 2007 el Estado creció a una tasa del 2.59% de la cual 0.366 son atribuibles al turismo, lo que equivale a que el sector turístico explicó el 14.13% del total del crecimiento. Una característica importante que vale la pena destacar en Guerrero es que la relación entre el crecimiento económico y las actividades turísticas es positiva (mismo signo) e importante; es decir, buena parte de los aumentos y caídas en la tasa de crecimiento de la economía son atribuibles a aumentos y caídas de la actividad turística. Este resultado podría indicarnos un cierto tipo de dependencia del Estado de Guerrero al Turismo.

Chiapas y Veracruz

Chiapas y Veracruz muestran un resultado muy interesante, ambos estados de alguna manera han tenido en crecimiento económico positivo en el mediano plazo de análisis (Veracruz con mayor intensidad que Chiapas), lo sorprendente es, que siendo dos de las Entidades Federativas de México con mayor importancia turística, el turismo parece no haber contribuido a el proceso de crecimiento económico de estos Estados. Vemos por ejemplo el caso de Chiapas que tuvo tasas de crecimiento económico positivas de 2.36%, 2.08%,

6.42% y 1.55% en los años 2006, 2008, 2010 y 2011 respectivamente; sin embargo, en esos cuatro años la contribución del turismo al crecimiento económico fue negativa, es decir, las actividades turísticas desaceleraron el crecimiento económico de la entidad en estos años. De manera análoga, Veracruz registró tasas de crecimiento económico de 4.92% (2004), 2.79% (2005), 3.46% (2007), 3.22% (2010) y 1.27% (2011), mientras que en estos periodos, la contribución del turismo al crecimiento económico fue negativa, volviéndose las actividades turísticas, al igual que un Chiapas un “freno” al crecimiento económico de la entidad en estos años. El resumen de los resultados para Chiapas y Veracruz pueden apreciarse en las figuras 5a y 5b respectivamente.

Figura 4: Contribución del Turismo al Crecimiento Económico de Guerrero

Figura 5a: Contribución del Turismo al Crecimiento Económico de Chiapas

Figura 5b: Contribución del Turismo al Crecimiento Económico de Veracruz

CONCLUSIONES

En este artículo se analizó la metodología propuesta por Ivanov y Webster (2007) y se aplicó a un grupo de cinco Entidades Federativas pertenecientes a México que se caracterizan por ser los estados con mayor afluencia turística. En particular, se analizaron los estados de Quintana Roo, Jalisco, Guerrero, Veracruz y Chiapas. Los resultados de la medición muestran que el Estado que presenta mayor participación de las actividades turísticas en el crecimiento económico es Quintana Roo, registrando una participación positiva con respecto al total del crecimiento del PIB de 27.65% (2004), 73.35% (2007), 64.85% (2008), 44.92% (2009) y 46.20% (2012) y una participación del 834% en el año 2010, es decir, mientras otros sectores de la economía caían en este año, las actividades turísticas compensaron esta caída y empujaron a que la tasa de crecimiento fuera positiva. Esta situación sugiere que el sector turístico en Quintana Roo se encuentra desarrollado y fuertemente integrado al proceso de crecimiento de la entidad.

Chiapas y Veracruz mostraron un resultado muy interesante, en ambos estados el turismo parece no haber contribuido a su proceso de crecimiento económico. Se encontró por ejemplo, que Chiapas tuvo tasas de crecimiento económico positivas de 2.36%, 2.08%, 6.42% y 1.55% en los años 2006, 2008, 2010 y 2011 respectivamente; sin embargo, en esos cuatro años la contribución del turismo al crecimiento económico fue negativa, es decir, las actividades turísticas desaceleraron el crecimiento económico de la entidad en estos años. De manera análoga, Veracruz registró tasas de crecimiento económico de 4.92% (2004), 2.79% (2005), 3.46% (2007), 3.22% (2010) y 1.277% (2011), mientras que en estos periodos, la contribución del turismo al crecimiento económico fue negativa, volviéndose las actividades turísticas, al igual que un Chiapas un “freno” al crecimiento económico de la entidad en estos años.

Jalisco es el Estado que registró las menores contribuciones del sector turístico al crecimiento económico, aunque positivas. Para los años 2011 y 2012, Jalisco registró tasas de crecimiento económico de 3.58% y 2.71% respectivamente y la parte atribuible al turismo de este crecimiento fue de 0.012% (2011) y 0.070%. Para los años en que Jalisco registró caídas en su crecimiento económico, la contribución que el turismo tuvo a dicha caída también fue pequeña, es decir, para los años 2008 y 2009 en Jalisco tuvo una contracción económica de -0.465% y -8.248% respectivamente, de esta caída sólo es atribuible al sector turístico el -0.025% en el 2008 y el -0.275% en el 2009. Lo sugiere que las actividades relevantes en el crecimiento económico del Estado de Jalisco, pertenecen a otras diferentes al turismo. El haber realizado la medición de la contribución que el sector turístico tiene sobre el crecimiento económico de los principales estados turísticos de México, nos permite tener una visión más amplia del vínculo existente entre las actividades turísticas y el crecimiento económico a nivel regional, por lo que este trabajo intenta ser una nueva contribución al mejor entendimiento de los impactos que el turismo tiene a nivel regional.

RESUMEN

Los organizaciones empresariales destacaron por su insistencia y pronunciamiento en el teme de la responsabilidad social, Confederación Patronal de la República Mexicana (COPARMEX) en ese entonces, Uniones Sociales de Empresarios de México, A.C. (USEM). Ambas aportaron elementos teórico-prácticos para la fundamentación y desarrollo del concepto mismo. Más tarde, en 1992, el Centro Mexicano para la Filantropía (Cemefi), creó el programa de Filantropía Empresarial con 6 empresas participantes, el objetivo de esta investigación es el análisis de un problema y dar a conocer el programa de ética con responsabilidad social. De una mediana empresa, que presta un servicio de salud, en el estado de Oaxaca de Juárez Oaxaca. Para esta investigación se tomó una muestra de la población y se realizó prueba estadística a un modelo para medir el impacto, los resulta. Para la recolección de los datos se diseñó un cuestionario el cual se estructuró con ítems para medir las escalas que definen el conocimiento de los recursos humanos sobre ética. La muestra se determinó con datos reales aplicando los cuestionarios a 15 personas de acuerdo a la estimación de la desviación estándar de la varianza acumulada y observada en el análisis factorial

TRAINING PROGRAM: ETHICS FOR SOCIAL RESPONSIBILITY IN A PRIVATE COMPANY

ABSTRACT

Business organizations highlighted by its insistence on the fears and statement of social responsibility, Confederation of Employers of the Mexican Republic (COPARMEX) then, Unions Social Entrepreneurs Mexico, AC (USEM). Both theoretical and practical elements contributed to the foundation and development of the concept itself. Later in 1992, the Mexican Center for Philanthropy (Cemefi), created the program Corporate Philanthropy with 6 participating companies, the objective of this research is the analysis of an issue and publicize the program on ethics with social responsibility. In a medium sized company, which provides a health service in the state of Oaxaca de Juárez Oaxaca. For this research a sample of the population was taken and statistical test was performed on a model to measure the impact, it is. For data collection a questionnaire which was structured with items measuring scales that define the knowledge of human resources on ethics designed. The sample was determined using real data questionnaires 15 people according to the estimate of the standard deviation of the accumulated variance and factor analysis observed

LOS RESULTADOS

mostraron que la ética y la responsabilidad social sirve para la contribución al desarrollo humano sostenible, a través del compromiso y la confianza de la empresa hacia sus empleados y las familias de éstos, hacia la sociedad en general y hacia la comunidad local, en pos de mejorar el capital social y la calidad de vida de toda la comunidad. Con la aplicación de las encuestas se da a conocer el análisis de dos problemas El objetivo de esta investigación analizar a través de la definición de indicadores y la prueba de Escalas En El Analisis De Un Problema En Una Mediana Empresa Y Dar A Conocer El Programa De Capacitacion “Ética Con Responsabilidad Social”.

Planteamiento del Problema

La competitividad y la calidad en la prestación de servicios son parámetros que en el marco mundial definen la importancia de la ética y la responsabilidad social, en este contexto La ética y la responsabilidad social son los instrumentos que proporcionan la información objetiva para fundamentar la toma de decisiones en la administración de una mediana empresa privada. Existen indicadores propuestos para evaluar programas de ética y responsabilidad social, como, Confederación Patronal de la República Mexicana (COPARMEX) en ese entonces, Uniones Sociales de Empresarios de México, A.C. (USEM). Ambas aportaron elementos teórico-prácticos para la fundamentación y desarrollo del concepto mismo. Más tarde, en 1992, el Centro Mexicano para la Filantropía (Cemefi), creó el programa de Filantropía Empresarial, la cual propone la generación de conocimiento que proporcione los instrumentos para medir el impacto de los programas. Para el desarrollo de la ética y responsabilidad social en las medianas empresas privadas. El análisis de los indicadores y escalas que permitan evaluar el programa de ética y responsabilidad social, puede proporcionar el instrumento validado metodológicamente para el seguimiento y para la toma de decisiones en los procesos de eficiencia en el servicio. Con responsabilidad social y ética

Marco Teórico

Lo que prevalece a nivel internacional en torno a los indicadores para el impacto de los programas de ética y responsabilidad social se localiza en el argumento para su validación, entre los parámetros que se encuentran en constante debate son: la ética, la responsabilidad social, el sueldo y las instalaciones. Con base en las recomendaciones del Centro Mexicano para la Filantropía (Cemefi), creó el programa de Filantropía Empresarial con 6 empresas participantes, en las que se han logrado importantes avances en la identificación de indicadores son: desconocer los términos de ética y responsabilidad social por pobreza, educación y empleo Uno de los aspectos importantes de esta investigación es conocer los efectos que ha tenido EL programa de ética y responsabilidad social en una mediana empresa privada. En este sentido, abordamos la evaluación del impacto de los programas y a través de las siguientes preguntas:

- ¿Es esta una empresa socialmente responsable?
- ¿Los directivos tienen un comportamiento ético?
- ¿Conoces los Valores de la empresa?
- ¿Sabes que es Ética?

Los antecedentes, de esta investigación se llevaron a cabo con 15 indicadores de los cuales surgieron 2 problemas importantes, Es importante considerar el costo-beneficio del tiempo y los recursos necesarios para su construcción, por lo que, de preferencia, debe ser medibles a partir del acervo de datos disponibles. ”El empleo de indicadores son verdaderamente útil en este proceso que responde a decisiones de participación de los trabajadores. Que permiten detectar avances y retrocesos de la gestión y tomar decisiones sustantivas, con lo que se construya una verdadera dinámica de cambio institucional. . De la ética y la responsabilidad social.

Limitaciones de los Indicadores

Los indicadores no están exentos de limitaciones para su conformación; entre la problemática que se puede presentar en su identificación e integración está la siguiente: Para la selección de los que se consideren más adecuados para cada objetivo, existen diferentes actores, como los sectores público, privado, social o académico que no comparten las mismas necesidades de información ni persiguen las mismas metas, lo cual dificulta lograr unanimidad en su definición. El carácter cuantitativo hace que se generen indicadores sólo de aquello que puede ser medido en cantidad. El uso de indicadores presupone que las metas de instituciones y dependencias públicas, así como sus niveles de logro están disponibles e identificables en planes y programas de gobierno y que no hay contradicciones entre los mismos. El depender de objetivos que son cambiantes, por lo menos en cada nueva administración, no sólo modifica el tipo de indicadores que deben ser empleados, sino también la disponibilidad de datos para conformarlos, lo que implica un ajuste permanente de las fuentes tradicionales de información.

Aspectos de la Evaluación del Impacto de los Programas

Una herramienta que utilizan los encargados de tomar decisiones en la formulación de políticas, y que hacen posible que los resultados de los programas. Son las encuestas y sus principales herramientas, tomando en cuenta la siguiente tabla de valores para reforzar la ética y sobre todo la responsabilidad social. Esta evaluación ayuda a tomar decisiones sobre la necesidad de ampliar, modificar o eliminar ciertas políticas del programa (Ver Tabla 1).

Tabla: Valor y Definiciones

Valor	Definición
Ética	Es la conducta de los individuos y de institución para demostrar el apego a normas y estándares que son socialmente reconocidos conforme a la moral y Las obligaciones del ser humano.
Honestidad:	Hablar y actuar siempre con la verdad.
Compromiso:	Ser congruentes con lo que se planea, se predica y se hace en beneficio De los pacientes y/o colaboradores.
Confianza	Esperanza firme que se tiene de alguien o algo. Es la opinión favorable en que una persona o grupo de que será capaz de actuar de Manera adecuada en una determinada situación.
Calidad:	Hacer bien el trabajo sin errores, orientando todos nuestros recursos y Esfuerzos hacia una mejor calidad de vida.
Servicio:	Conocer las necesidades y superar las expectativas en materia de recursos humanos (cuerpo médico), de nuestros pacientes, atendiéndolos con un trato profesional, Personalizado y una actitud positiva y cordial.

Formulación de Hipótesis

Los antecedentes de la empresa presentan indicadores de acuerdo a las características culturales, de la empresa se planea que:

El programa de ética y responsabilidad social tiene un impacto positivo para la organización referente a los trabajadores y socios.

METODOLOGÍA

Primero se procedió a elegir una empresa, para conocer sus problemas se continuo con la aplicación de encuestas a los trabajadores. Que dan validez y confiabilidad. A esta investigación. Para la prueba

estadística y medir el impacto del conocimiento de ética. Se recolectaron los datos diseñando el cuestionario para medir, el conocimiento de los recursos humanos sobre ética el cual se estructuró con ítems para las escalas que definen la muestra, con datos que arrojaron la estimación de la desviación estándar de la varianza acumulada y observada en el análisis factorial para así conocer el problema de la empresa.

Población: Se consideró como población todos los trabajadores y socios de esta empresa

Muestra: Se consideró la base de datos de todos los trabajadores de esta empresa de la cual se obtuvo una muestra de 15 sujetos de acuerdo a la estimación de la desviación estándar de la varianza acumulada y observada en el análisis factorial realizado al cuestionario.

Cobertura del Programa: La cobertura del programa de ética y responsabilidad social es para toda la empresa y se toma una muestra al azar, con la base de datos.

Diseño de la muestra estratificada: Las técnicas estadísticas junto con las muestras fueron de gran ayuda para esta investigación.

Procedimiento: Para esta fase se estructuró un cuestionario, el cual se aplicó a 15 trabajadores de esta empresa. En el cual se dividió en 3 fases, 1.- a trabajadores administrativos, 2.- personal médico y 3.- personal de intendencia.

En este cuestionario se incluyeron preguntas para observar el comportamiento de los indicadores.

Cobertura del Programa: La cobertura del programa de ética y responsabilidad social es para toda la empresa.

Aplicación de la Encuesta

Con el análisis y la validez del paquete SPSS, se definió el cuestionario, el cual se aplicó como encuesta a 15 trabajadores, de la organización.

Análisis de Resultados de la encuesta: Aplicados los cuestionarios en los 3 grupos participantes, se procedió a codificar, tantos cuestionarios por número como cada uno de los ítems incluidos para después capturar directamente en la hoja de cálculo del programa SPSS (Figura 1)

Fases De La Planificación, Estrategia Y Programa De Ética Empresarial

Fase 1: Despertar el interés en la ética empresarial en LA ORGANIZACION

Fase 2: Preparar la guía general para el/los código(s) modelo(s)

Fase 3: Preparar las adecuaciones al Manual de Ética Empresarial y otras herramientas de capacitación

Fase 4: Capacitar en ética empresarial

Fase 5: Establecer mecanismos de cooperación sector público y privado

Fase 6: Crear una iniciativa de ética empresarial sostenible a largo plazo

Figuras 1: Lider Por Conoc y Consultor

CONCLUSIONES

La efectividad del programa está estrechamente relacionada con las percepciones de los empleados en cuanto a la orientación de un programa de ética empresarial. El objetivo general que se persigue es consolidar los objetivos de la empresa, para lograr ser líderes en los servicios médicos particulares en el estado. Mercadotecnia social y desarrollo comunitario u organizacional correrán a cargo de la empresa. La propuesta de solución de problemas por falta de ética y valores se da por el reciente ingreso de personal a quien hay que concientizarle y el reforzamiento en el personal de base. Dos factores son lo más

importante: Que la ética se percibe cómo importante para el liderazgo —desde el ejecutivo hasta el supervisor— y Que los empleados creen que se los trata justamente. Es particularmente importante que las políticas de la empresa y las acciones administrativas sean coherentes y que los sistemas de recompensa apoyen el comportamiento ético Las principales orientaciones de un programa son:

Un enfoque basado en el cumplimiento, el cual se “enfoca principalmente en la prevención, la detección y el castigo de las violaciones a la ley”

Un enfoque basado en los valores, el cual “tiene como fin definir los valores organizativos y alentar el compromiso del empleado a las aspiraciones éticas”

Un enfoque externo satisfactorio de los partícipes a través del cual las empresas “tienen la esperanza de mantener o mejorar su imagen pública y las relaciones con los partícipes externos”

Un enfoque que protege a los altos ejecutivos, el que “es introducido en parte para proteger a los propietarios y a los altos ejecutivos de la culpabilidad por las fallas éticas o problemas legales”

Los propietarios y gerentes deben determinar el acercamiento y la orientación de su programa de ética empresarial, deben:

Identificar y comprometer a todo los partícipes de la empresa, Promover sus expectativas razonables y Ordenar los asuntos comerciales de la empresa de manera que mejoren su rendimiento comercial e incrementen la prosperidad de su comunidad mediante el cumplimiento de esas expectativas.

Abel Antonio Morales Santiago, Universidad Autónoma Benito Juárez Oaxaca

RESUMEN

El turismo convencional, impulsado a partir de los años 70's con la oferta de destinos de sol y playa, propulsó la creación de MiPyMes relativas al sector turístico y restaurantero. La zona del Caribe, mundialmente famosa por sus playas, resultó beneficiada y muchos de esos establecimientos de más de treinta años de operación, siguen brindando sus servicios. Como podemos observar en el sector de Gran Turismo, las instalaciones hoteleras y los servicios se modernizan y adquieren nuevas políticas. Sin embargo, existe un gran número de hoteles de talla pequeña o mediana que sustentan su existencia en un servicio austero y clásico. En esta investigación se pretende, mediante la aplicación de una entrevista semi estructurada a propietarios y administradores para identificar indicadores que demuestren la forma de permanencia de estas empresas en los destinos turísticos a lo largo de la isla y la relación que puede existir entre permanencia-manejo desde la perspectiva del turismo clásico de 1970 y el gran turismo o nuevas propuestas recientes. Serán empleados los indicadores de permanencia, incluyendo las técnicas de manejo hotelero estándar, para analizar ocho establecimientos hoteleros en cuatro lugares turísticos a lo largo de la isla y por medio de una entrevista a profundidad a un gerente de cada sitio turístico para identificar dichos elementos que definen la preferencia por el lugar y su intención de nuevas visitas. Los resultados mostraron que los administradores identifican los aspectos de servicio, la adaptación a las nuevas tecnologías y los elementos del turismo clásico que conservan y que forman un balance con los elementos adquiridos recientemente. La permanencia en las empresas turísticas de Puerto Rico se relaciona con la relación entre las prácticas de manejo hotelero convencionales de 1970 y las contemporáneas integrando diferentes factores de tecnología y calidad sin perder la esencia clásica logrando un balance.

PALABRAS CLAVE: Indicadores, Permanencia, Empresas Turísticas

PERMANENCY INDICATORS IN TRADITIONAL TOURISM ENTERPRISES OF PUERTO RICO

ABSTRACT

Conventional tourism, powered from the 70's with the offer of sun and beach destinations, propelled the creation of MSME's on tourism and restaurant sector. The Caribbean region, world famous for its beaches, was benefited from it and many of these establishments over thirty years of operations continue to provide their services. As seen in the area of Great Tourism, the hotel facilities and services were modernized and acquired new policies. However, there are many small or medium size hotels that support its existence in a simple, classic service. This research aims by applying a semi-structured interview directed to owners and managers to identify indicators that demonstrate how these companies remain. This study is directed to Tourist destinations along the island and the relationship that may exist between permanence and management from the perspective of 1970 classic tourism and grand tourism recent or new proposals. Remain indicators will be employed, including classic hotel management techniques to analyze eight hotel establishments in four tourist sites along the island and through a depth interview directed to a manager

of each tourist site to identify those elements that define the place preference and intention to return visits. The results showed that managers identify aspects of service, adapting to new technologies and classic tourism management elements conserved and forming a balance with newly acquired items. Permanency in Puerto Rican tourism companies relates to the relationship between the practices of conventional 1970 hotel management and contemporary factors integrating different technology and quality without losing the classic essence achieving a balance.

KEYWORDS. Permanency, Indicators, Tourism Enterprises

INTRODUCCIÓN

El problema radica en la situación de las empresas hoteleras de Puerto Rico. La situación del turismo se encuentra entre el desarrollo del gran turismo ó modernidad turística y la continuidad de las prácticas de manejo hotelero clásicas desde 1970. La mayoría de las empresas turísticas de Puerto Rico se encuentran insertas en sitios con atractivos turísticos de sol y playa los cuales se caracterizan por contar con hermosos paisajes naturales y algunos con elementos culturales. Sin embargo, existe una gran diferencia entre el gran turismo y el manejo turístico clásico, por lo que se plantea como pregunta de investigación ¿Cuáles son los aspectos de adaptación que integran las empresas turísticas antiguas en sus servicios en relación a la modernización y como se expresan en términos de desarrollo para la misma?

Esta investigación se presenta organizada de la manera siguiente. En la sección de revisión de la literatura se presentan los resultados disponibles sobre el estudio de permanencia en empresas turísticas en E.U. y particularmente en Puerto Rico, el análisis sobre el concepto de permanencia y la comparación en los indicadores empleados para evaluar los servicios turísticos antiguos y recientes. En el apartado de Metodología se incluyen las características de la muestra, la definición operacional de las variables, el procedimiento seguido para diseñar las entrevistas y su aplicación y el análisis de los datos. En la sección de resultados se emplean tablas para facilitar la presentación de los datos y su explicación resumida. La conclusiones permiten comparar los resultados con el objetivo planteado y mostrar la relevancia de este estudio para la comprensión de los factores de permanencia como elementos para el desarrollo de las empresas turísticas de Puerto Rico.

REVISIÓN DE LITERATURA

Según Ortuño (1990), la exigencia de movilidad, expresado por el turismo, e inspirada por un imaginario impulsa al sujeto a viajar. Este sujeto pretende encontrar una serie de elementos que su imaginario integra por medio de sugerencias a inspiraciones previamente adquiridas. Para Villa Real (2007;13), el turista busca un paquete completo de diversión, entretenimiento, bienestar, higiene y cortesía. Puerto Rico a pesar de no contar con una tradición culturalizada de servicio y hospitalidad tan antigua como en el caso de Francia, España e Italia, a partir de los años 70's y gracias a la mercadotecnia del turismo en el Caribe, se hace popular alrededor del mundo y empieza la formulación de micro, pequeñas y medianas empresas hoteleras regionales en la capital San Juan y posteriormente en otros lugares de la isla. Muchas de estas empresas que iniciaron sus operaciones en la década de los 70's con un enfoque esperado hacia el turismo internacional, se mantienen operando desde estas fechas con un toque característico de hospitalidad auténtico, latente y constante el cual puede asemejar al tipo de turismo que observaron (Velázquez-Sánchez, et al., 2014) en comunidades mexicanas. Con la expectativa de mercado del turismo extranjero, se establecieron ciertos estándares y características que probablemente el día de hoy sean algo obsoletas, pero en su tiempo fueron las mejores; precisamente lo que este estudio pretende analizar son las características que permiten la continuidad de estas empresas, así como los elementos de innovación con los que cuentan, para identificar el balance que permite la permanencia. En lo que se refiere a estudios de permanencia en empresas, existen diferentes perspectivas para analizarla, desde el punto de vista de proyecciones financieras, hasta el punto de vista especializado. Como en el caso del estudio de Cervantes y Gallardo (2009) que analiza la permanencia en MiPyMes en virtud de estrategias de viabilidad y riesgos; sin embargo no existe algún

estudio que analice desde el punto de vista de las prácticas hoteleras, por ello se planteó integrar variables de permanencia como una dualidad entre los elementos que prevalecen de las prácticas hoteleras clásicas y los que se añaden del manejo hotelero moderno en virtud del tiempo.

METODOLOGÍA

Se analizó una muestra de ocho prestadores de servicios turísticos tradicionales. Se diseñó una entrevista semi-estructurada con preguntas orientadas a revisar las características que definen la permanencia de las empresas turísticas y se entrevistó a nueve prestadores ó administradores de empresas hoteleras en las localidades de San Juan, Ponce, Guaynabo e Isabela en Puerto Rico. Se incluyeron las variables: Categorías de las prácticas de manejo clásicas y categorías de manejo contemporáneas o modernas. Los datos obtenidos han permitido hacer una primera aproximación, identificación y definición de los indicadores de permanencia y adecuación entre los elementos clásicos y modernos de manejo turístico de la isla de Puerto Rico.

Definición Operacional de las Variables

Elementos de manejo hotelero clásico: Se consideró como una variable numérica. A partir de los indicadores de autenticidad, técnicas propias iniciales y adaptación. Y se midió con base a las respuestas de los entrevistados.

Elementos de manejo hotelero contemporáneo-moderno: Se definió por los servicios ofrecidos y se consideró como una variable numérica. Se midió con base a las respuestas emitidas por los prestadores o administradores de las empresas turísticas.

Tabla 1: Definición Operacional de las Variables Manejo Hotelero Clásico y Contemporáneo ó Moderno

variables	categorías	indicadores	
Elementos de manejo hotelero clásico	Autenticidad	Originalidad Filosofía Servicios ofrecidos Mercado a dirigirse	
	Técnicas propias iniciales	Atención al huésped Sistemas de información Administración	
	Adaptación	Elementos modernos Competencia Normatividad local Cambio de propietarios/administración	
	Elementos de manejo hotelero contemporáneo-moderno	Innovación	Servicios agregados Crecimiento y contrataciones Remodelación Cambios en la administración Convenios y otros
		Tecnologías	Tecnologías incorporadas Infraestructura Equipamiento
		Marketing	Medios físicos Medios electrónicos Análisis de mercado
Recreación		Deportes y actividades Convenios externos para recreación Atractivos turísticos naturales Atractivos turísticos culturales	
		Entorno en general	

En la tabla 1: se observan las categorías y los indicadores de las variables de manejo hotelero clásico y moderno ó contemporáneo. Las variables son numéricas y se incluirán en el análisis de la relación entre los servicios iniciales y las categorías de modernidad en virtud de la adaptación.

Descripción del Procedimiento

Con base en la información obtenida de los datos de la PRHTA (Puerto Rico Hotel & Tourism Association), se seleccionaron los cuatro lugares en los que se observan las ocho empresas turísticas localizadas a lo largo de la isla de Puerto Rico, mismos incluidos en la tabla 1:, para ser analizados bajo los rubros de manejo hotelero clásico y moderno-contemporáneo.

Tabla 2: Muestra de las Empresas Turísticas Analizadas a lo Largo de la Isla de Puerto Rico y Localidades En Que Se Encuentran

Empresa Turística	Localidad
El Convento	San Juan
Plaza de Armas	San Juan
Viejo San Juan	San Juan
Fortaleza Guest House	San Juan
Hotel Bélgica	Ponce
Hotel Meliá	Ponce
Hotel El Guajataca	Guaynabo
Parador Villas del Mar	Isabela

En la tabla 2: Se pueden observar las ocho empresas turísticas analizadas en esta investigación y que se encuentran localizadas en los cuatro sitios turísticos de la isla de Puerto Rico. Fuente. Elaboración propia con los datos revisados en la isla.

Descripción de las Empresas Turísticas Analizadas En Puerto Rico

El Convento: Se localiza en Viejo San Juan. Empezó como un proyecto propulsado por operación Bootstrap de Woolworth en 1962. La razón principal por la cual las personas se hospedan aquí es por turismo y por su localización en viejo San Juan. Los servicios que proporciona es hospedaje con 8 habitaciones con agua caliente, aire acondicionado, gimnasio, tres restaurantes, bussiness center, Valet Parking, Club de Playa, Salón de reuniones, alberca, lavandería automática y jardín botánico. Al parecer no cuentan con clientela fiel. Aumenta sus precios en temporada alta. Recientemente no ha sufrido de bajas en su afluencia turística. Su mercado se orienta hacia el gran turismo en el centro histórico.

Plaza de Armas: Ubicado en el centro histórico de San Juan con más de 60 años en operación. Hubo un cambio de administración que no interrumpió las operaciones de la empresa. Cuenta con atención en inglés y francés. Cuenta con marketing en la isla y en el extranjero, así como convenios de colaboración con empresas locales. Aumenta sus precios en temporada alta. Al parecer no cuentan con clientela fiel. Su sustento se basa en el turismo extranjero y principalmente proveniente de cruceros, misma situación que afectó sus ingresos cuando existieron conflictos con las líneas de cruceros y la administración portuaria.

Viejo San Juan: Antigua casa de huéspedes en el centro histórico de San Juan. Inició sus operaciones en 1925. Cambió de administración al morir el dueño y quedar intestado en 1957. Inició operaciones con 5 personas, en la actualidad son 10. No cuentan con marketing o alguna tecnología para reservaciones o pagos en línea. Cuenta con habitaciones privadas con baño compartido, habitaciones compartidas de cuatro y terraza para camping. No aumenta sus precios en temporada alta y no ha sufrido bajas en su afluencia. Cuentan con clientela fiel y de años. Su mercado se centra en turismo informal.

Fortaleza Guest House: Pequeño establecimiento clásico en el centro histórico de San Juan. Se ofrece como Guest House con nueve habitaciones compartidas dobles y cuádruples, cuatro de ellas con balcón. No cuenta con atención en otros idiomas pero si con beneficios como autoservicio de cocina y lavado de ropa. Atienden reservas en hostels world.com. No aumenta sus precios en temporada alta y no ha sufrido bajas en su afluencia. Cuentan con clientela fiel. Su mercado se centra en el turismo mochilero.

Hotel Bélgica: Ubicado en Ponce, la segunda área metropolitana por tamaño en la isla. Inició sus operaciones en 1886. Ha tenido varios dueños de diferentes familias. A partir de 1995 lo administra una familia y los trabajadores son familiares o amigos. Cuenta con atención en inglés. Cuentan con marketing cibernético y sistemas de reservaciones en línea. Cuentan con habitaciones de distintas categorías. Toma como ventaja el ser un punto estratégico para el turismo a lo largo de la isla. Ha sufrido afectaciones en sus ingresos por cuestiones naturales como huracanes e inundaciones. Cuentan con clientela fiel. Su mercado se centra en personas mayores.

Hotel Meliá: Igualmente ubicado en Ponce, es un hotel que data de 1890 inaugurado por una familia española hasta 1960 que cambió a una familia americana para recientemente pasar a manos de un lugareño. No ha sufrido interrupciones en sus operaciones. Cuenta con comodidades como Wi-Fi, piscina, bussiness center. Cuenta con reservaciones en línea y redes sociales. Ha sufrido afectaciones en sus ingresos por cuestiones de naturaleza. Al parecer no cuentan con clientela fiel. Su mercado se centra en turismo local y familiar, así como de negocios.

Hotel El Guajataca: Es un parador – hotel en una hermosa playa del norte de la isla, construida en 1930 fungiendo como parador turístico al ser una atracción histórica con la playa y el túnel así como de apreciación al entorno natural, cuentan con spa, piscina, habitaciones con jacuzzi, y restaurante. Cuentan con marketing en redes sociales y publicidad local en caso de que existan eventos. No han sufrido disminuciones en sus ingresos recientemente, es una nueva administración. Su mercado se centra en turismo de relajación, turismo de aventura y familiar.

Parador Villas del Mar: Es un complejo localizado al norte de la isla en el distrito autónomo de Isabela. Inició sus operaciones en 1950. Nunca ha pausado sus operaciones. Se caracteriza por presentar tecnologías alternativas como celdas solares y generadores de viento. Cuentan con cabañas de distintos tamaños con vista al mar y frente a la playa. De igual manera cuentan con un huerto de lechugas y tubérculos. Cuentan con arribo de tortugas, manatíes y ballenas en ciertas temporadas del año. Cuenta con marketing en línea, reservaciones y en programas de televisión en el extranjero, como caribbean places y vacations to go. Sufrieron ciertas disminuciones en su afluencia turística por contingencias sociales en 2001 y huracanes.

Análisis de los Datos

Se realizó el análisis factorial a los datos de la entrevista realizada a los administradores de las empresas. Los resultados mostraron la formación de tres factores en la variable de Elementos de Manejo Hotelero Clásico: *Autenticidad, Técnicas Propias Iniciales y Adaptación*. Es decir los elementos de que distinguen los visitantes se agrupan en tres de las categorías propuestas en este estudio. Con los resultados del análisis factorial se realizó la evaluación a cada uno de los nueve proyectos ecoturísticos y se resumen en la Tabla 3:.

RESULTADOS

A continuación se presentan en la Tabla 3: los resultados que muestran el índice de indicadores de permanencia en las empresas turísticas analizadas en este estudio.

Tabla 3: Índice de Indicadores de Permanencia Identificados En Base a la Entrevista a Profundidad Aplicada a Dueños O Administradores de Empresas Hoteleras de Más de 40 Años de Actividades En Puerto Rico

Empresa Turística	Categorías Destacadas	Indicadores (Por Variables Numéricas)
El Convento	<i>Autenticidad</i> al ser una oferta moderna en los años de su apertura. <i>Tecnologías</i> por la integración de infraestructura y equipamiento nuevos después de la remodelación.	No cuentan con la variable de recreación y no se encuentran elementos de adaptación en virtud del tiempo. *(.715)
Plaza de Armas	<i>Adaptación</i> Al integrar factores de manejo hotelero actualizados y ocupando técnicas clásicas <i>Innovación</i> Integrando nuevos servicios, contrataciones, remodelaciones, cambios en la administración y convenios externos.	Ha mantenido una constante adaptación e innovación en virtud del tiempo. No cuenta con factores de recreación a pesar de los convenios externos. *(.723)
Viejo San Juan	<i>Autenticidad</i> con base el entonces nuevo concepto de guest house	Cuenta con muy pocos factores de manejo hotelero contemporáneo, lo que ocasiona que el valor de adaptación sea nulo. *(.547)
Fortaleza Guest House	<i>Adaptación</i> Al ser una empresa muy básica, se cumplen estos factores.	Se considera suficiente el aspecto de adaptación en virtud de los indicadores de equipamiento, remodelación y administración. *(.694)
Hotel Bélgica	<i>Autenticidad</i> Al ser un negocio familiar de antaño <i>Técnicas Propias Iniciales</i> por la misma razón	El manejo hotelero clásico hace buen equilibrio con los elementos adoptados del moderno cuán sea necesario. Ello beneficia a la permanencia. *(.789)
Hotel Meliá	<i>Adaptación</i> por ser la antigüedad <i>Técnicas propias iniciales</i> por la administración especializada <i>Adaptación</i> por la armonía que existe entre los elementos antiguos y los modernos <i>Innovación</i> por los cambios en la administración y crecimiento	En las empresas antiguas la adaptación es casi inevitable; en el factor de autenticidad falla por el giro que pretende hacia el turismo ejecutivo. *(.703)
Hotel El Guajataca	<i>Autenticidad</i> Por la oferta variada que da <i>Adaptación</i> por la integración de factores modernos <i>Innovación</i> por el cambio que existe entre parador y hotel	Al incluir diversos factores modernos en armonía con los antiguos e incluyendo la variable del turismo alternativo, existe un incremento. *(.855)
Parador Villas del Mar	<i>Recreación</i> Incluye factores deportivos y de turismo natural <i>Autenticidad, Técnicas propias iniciales, Adaptación, Innovación, Tecnologías, Marketing y Recreación</i>	Incluyendo todas las variables analizadas incrementa el valor de permanencia radicalmente *(.905)

Tabla 3: Se pueden observar los resultados obtenidos del análisis de los datos de las entrevistas realizadas a ocho dueños o administradores en los cuatro destinos turísticos localizados en la isla de Puerto Rico. En los resultados se destaca la identificación de factores de permanencia y adaptación hacia los nuevos elementos del turismo. Entre las ocho empresas turísticas analizadas manifiestan el giro de Guest House en el caso de Fortaleza y Viejo San Juan. Se destaca que Villas del Mar expresa su giro como Parador Turístico.

En *Fortaleza Guest House* y *Viejo San Juan* encontramos una evidente continuidad a pesar del rezago en las categorías de innovación, tecnologías y las variables de servicios agregados. Esto se debe al giro de la empresa que incluye precios bajos y por ende una clientela base. En *El convento*

encontramos una perspectiva acaparadora en cuestión de servicios; sin embargo es evidente la falta de elementos clásicos que pudieran mejorar su perfil de permanencia.

En el *Parador Villas del Mar* se cumplen con todas las categorías analizadas. Desde el aspecto recreativo que casi no fue encontrado, hasta las cuestiones de adaptación e innovación. Este es el claro ejemplo donde al cumplir con los indicadores planteados, se logra un éxito, Villas del mar fue el mejor resultado de permanencia.

Mientras tanto en *Plaza de armas*, destacan los factores de adaptación e innovación. Los cambios en la administración han sido benéficos y se encuentra dentro de los más visitados en la zona. A diferencia de *El Convento*, integra factores del servicio clásico que manifiestan una mejora en su valor de permanencia.

En *Hotel El Guajataca*, se encuentra el contraste entre varias vertientes (turismo alternativo, historicidad y cierta armonía entre elementos clásicos y modernos del turismo), lo que lo convierten en un sitio preferido por el amplio espectro que llama en el mercado. Esa es la misma razón por la cual, su valor de permanencia sube considerablemente.

Hotel Bélgica, destacó por su manejo familiar a pesar de los cambios en administración. Existe un control de operaciones muy bueno por la misma razón. Obtuvo un valor considerable a pesar de la falta de algunas características de modernidad por la cuestión relativa que existe entre los elementos clásicos y los nuevos.

En *Hotel Meliá*, encontramos que las cuestiones de servicio clásico dominan, sin embargo su valor de permanencia disminuye por la falta que existe de la parte moderna y de adaptación.

CONCLUSIONES

Al revisar los resultados en *Viejo San Juan y Fortaleza*, destaca el servicio a bajo costo y un servicio austero. Cumple de manera suficiente el índice de permanencia como *Hostel o Guest House*, por la demanda latente de turismo informal o más recientemente, juvenil. La adecuación de los servicios e infraestructura se manifiesta en la permanencia como servicio turístico, a pesar de ser diferentes a un hotel. Se observa el potencial de crecimiento y existe el trabajo en conjunto para la comunicación y colaboración con otras empresas turísticas cercanas de un giro similar, por ejemplo, cuando un hostel no tiene capacidad, transfiere a otro cercano. En *Plaza de Armas* incluye valores de adaptación. Es uno de los sujetos más recientes en este estudio y a pesar de ellos, destaca en valores de adaptación y constante innovación. Integra tecnologías nuevas que ayudan al manejo y mercadotecnia. Al igual que los demás hoteles no cuenta con la categoría de recreación.

El complejo de *Parador Villas del Mar*, se observan valores de todas las categorías analizadas. Dentro de los cuales destacan los aspectos de adaptación y, a diferencia de los demás, integra elementos de recreación. Podemos observar un fuerte impulso por parte de la modernidad (más aún en tecnología ambiental), pero sin perder la esencia del servicio de turismo clásico. En *Hotel el Guajataca*, al previamente haber fungido como parador (complejo turístico con apoyo del gobierno), y recientemente por cambio de administración, un cambio a hotel, conserva elementos del turismo clásico y por la amplitud del que previamente fue un proyecto turístico de naturaleza, sol y playa; cuenta con características de recreación y adaptación.

En *Hotel Bélgica* se puede apreciar la administración familiar ó amistosa a pesar de los cambios en la administración a lo largo de la historia. En mi opinión, al igual que todas las empresas turísticas analizadas, cuenta con ventajas de mercado; en este caso el hecho de que Ponce es un punto estratégico

de comunicación hacia otros lugares de la isla. Podemos considerar que es un hotel austero, sin embargo cuenta con un valor de permanencia alto por el valor de adaptación con el que cuenta. En *El Convento*, dominan los valores de manejo hotelero moderno; existe un rezago en la categoría de adaptación, que disminuye considerablemente su valor de permanencia. Por otra parte, *Hotel Meliá* minimiza los valores de manejo hotelero moderno, rescatando muchos valores clásicos, pero como podemos ver, sin el factor de modernidad y adaptación, no es mayor el valor que alcanza.

Los resultados obtenidos en esta investigación permiten responder a la pregunta de investigación. La inclusión de elementos de manejo hotelero clásico permitiendo la adaptación a las nuevas técnicas y tecnologías hoteleras permite lograr una armonía y posteriormente un valor de permanencia elevado. Los resultados permiten contribuir al cuerpo de la literatura con una metodología para evaluar la pertinencia de las prácticas hoteleras en Puerto Rico. La evaluación de la importancia de los elementos de adaptación para la preferencia del visitante permite observar la ventaja que representa en la variable de afluencia turística. También contribuye al conocimiento de la estrategia de la adecuación de las prácticas hoteleras clásicas con las modernas.

Limitaciones

Dentro de las limitaciones de este estudio se pueden considerar las características propias desde la perspectiva del turista. El tiempo en que se realizó el estudio. La pequeña variabilidad entre dueño y administrador entrevistado. Las empresas turísticas analizadas. Por lo que pueden realizarse estudios en otras regiones o países y en otros periodos de visita.

LA INFLUENCIA DE LAS BARRERAS A LA INNOVACIÓN EN LA GESTIÓN DEL CONOCIMIENTO DE LA PYME MANUFACTURERA

Jorge Antonio Rangel Magdaleno, Universidad Autónoma de Aguascalientes

Luis Aguilera Enríquez, Universidad Autónoma de Aguascalientes

Martha González Adame, Universidad Autónoma de Aguascalientes

RESUMEN

La literatura indica que el papel de la innovación en el desempeño de las organizaciones empresariales es determinante, influyendo en gran medida aspectos como su competitividad, rentabilidad y gestión del conocimiento. Este trabajo se enfoca en analizar la relación entre las barreras a la innovación y la gestión del conocimiento en las Pequeñas y Medianas Empresas (Pymes) manufactureras, identificando la significancia de las interrelaciones entre estas variables a través de un Modelo de Ecuaciones Estructurales (MEE), así como el análisis de fiabilidad correspondiente para cada una de las escalas utilizadas. Para este estudio se consideró una muestra de 150 Pymes del sector manufacturero del Estado de Aguascalientes, México. Los resultados obtenidos arrojan evidencia empírica de que sólo la barrera a la innovación que representan los recursos humanos influye de manera negativa en la gestión del conocimiento de las empresas estudiadas.

PALABRAS CLAVE: Barreras a la Innovación, Gestión del Conocimiento, Pymes

THE INFLUENCE OF BARRIERS TO INNOVATION IN KNOWLEDGE MANAGEMENT OF MANUFACTURING SMEs

ABSTRACT

The literature indicates that the role of innovation in the performance of business organizations is critical, influencing aspects such as competitiveness, profitability and knowledge management. This work focuses on analyzing the relationship between barriers to innovation and knowledge management in the Small and Medium Enterprises (SMEs) manufacturing, identifying the significance of the interrelationships between these variables through a Structural Equation Model (SEM) and the corresponding analysis for each of the scales used reliability. For this study, a sample of 150 SMEs in the manufacturing sector of the State of Aguascalientes, Mexico, was considered. The results shed empirical evidence that the only barrier to innovation representing human resources has a negative influence on knowledge management in the companies studied.

KEY WORDS: Barriers to Innovation, Knowledge Management, Smes

INTRODUCCIÓN

Para tener éxito en un mercado global, las empresas requieren desarrollar nuevas ideas que se traduzcan en conocimientos útiles, transmisibles y conservables en el marco de sus estrategias empresariales. El adecuado desempeño empresarial se ve influenciado en gran medida por la innovación, puesto que permite a las organizaciones encontrar más eficientemente la demanda de los clientes y aprovechar las oportunidades estratégicas de mercado (Saatcioglu y Timurcanday, 2010). De esta manera, las actividades

innovadoras deben de manejarse adecuadamente con la finalidad de convertirse en conocimiento útil y trascendente para diferentes procesos y áreas de la empresa.

En la literatura no abundan estudios empíricos que consideran la relación de las barreras a la innovación y la gestión del conocimiento en Pymes. Así, el presente trabajo de investigación, a través de un enfoque cuantitativo, empírico y correlacional, busca analizar la influencia de las barreras a la innovación en la gestión del conocimiento de las Pymes manufactureras del Estado de Aguascalientes, México. Para esto, mediante un muestreo probabilístico aleatorio simple de Pymes manufactureras de Aguascalientes se obtuvo una muestra de 150 empresas a la cuales se les aplicó, durante el periodo comprendido entre abril – junio de 2012, un instrumento de medición tipo encuesta personalizada dirigida a los gerentes o responsables directos de la administración de este tipo de organizaciones. En la primera fase de la revisión de los resultados, se realizó un análisis de fiabilidad considerando el coeficiente Alfa de Cronbach con la finalidad de validar la confiabilidad de las escalas utilizadas (Nunnally y Bernstein, 1994). Posteriormente se aplicó el Modelo de Ecuaciones Estructurales para contrastar las hipótesis planteadas utilizando el programa estadístico EQS v6.1, evaluando la adecuación del modelo teórico y su bondad de ajuste (Bentler, 2005; Byrne, 2006; Brown, 2006). Ambos análisis se realizaron con el programa de cómputo IBM SPSS Statistics versión 21, con lo que se analiza la relación existente entre las barreras a la innovación y gestión financiera de las Pymes manufactureras del Estado de Aguascalientes.

El resto de esta investigación está organizado como sigue: en la sección de marco contextual se presenta un acercamiento a la situación actual por la cual está pasando el objeto de estudio, haciendo hincapié en su importancia para la economía nacional y local. En la sección de revisión de la literatura se muestra literatura relevante relacionada con los constructos considerados como tema central de la investigación. En la sección de metodología se observa el diseño a través del cual se efectuó este trabajo, señalando el enfoque y tipo de investigación, así como la manera de operacionalización de las variables. La sección de resultados y discusión parte de los datos que arrojaron los instrumentos de recolección de información y se realizan las interpretaciones correspondientes para valorar las hipótesis planteadas. Finalmente, en la sección de conclusiones se establecen los comentarios finales sobre los resultados obtenidos, además de enunciar las limitaciones y futuras líneas de investigación.

REVISIÓN DE LA LITERATURA

Barreras a la Innovación

En los últimos años, la Pyme manufacturera no ha sido ajena a los cambios importantes que se han generado en la economía mundial así como en la local, es por ello que los gestores están cada vez más interesados en mejorar sus estrategias de operación en donde aspectos como la innovación, son objeto de estudio por parte de académicos y foco de atención por parte de los empresarios (Rubio y Aragón, 2006; Monagas, 2012). En este sentido, investigadores han coincidido que los recursos o factores clave en el éxito empresarial son la tecnología, la innovación, los recursos comerciales, los recursos humanos, las capacidades directivas, aspectos financieros, la gestión del conocimiento, la cultura organizacional y la calidad del producto o servicio (Barney, 1991; Rubio y Aragón, 2006).

El concepto de innovación ha sido definido desde diferentes enfoques, el Manual de Oslo (OCDE, 2005) señala que la innovación consiste en la introducción de un nuevo, o significativamente mejorado, producto (bien o servicio), proceso, método de comercialización o método organizativo en las prácticas internas de la empresa, la organización del lugar de trabajo o las relaciones exteriores. Sin embargo, existen una serie de condiciones adversas (barreras) que limitan la innovación. Para Piatier (1984) las barreras a la innovación son cualquier factor que influye de modo negativo los procesos de innovación, generalmente están asociadas a los costos, recursos humanos, cultura organizacional, el flujo de la información y las políticas gubernamentales. (Mohen y Roller, 2005). Entre los estudios más destacados relacionados con

este tema se encuentran el estudio de Hadjimanolis (1999), de las barreras a innovación en Pymes de Chipre, el de Frenkel (2003) de barreras y limitaciones en el desarrollo de la innovación industrial, el de Silva, Leitão, y Raposo (2007) sobre barreras de la innovación enfrentadas por las empresas manufactureras en Portugal, el estudio de Van Auken, Madrid-Guijarro y García (2008) sobre la innovación y el desempeño, los trabajos de Tiwari y Buse (2007) y Madrid-Guijarro, García y Van Auken (2009), sobre las barreras a la innovación.

Gestión del Conocimiento

Por otra parte, autores definen a la gestión del conocimiento como el intercambio de conocimientos entre los individuos con la finalidad de poder construir un sistema de información el cual permita, una vez que se tenga un cúmulo de información (Crnjar, 2006), poder establecer una relación con los sistemas educativos, donde la intervención en este sentido, por parte de la tecnología y de los sistemas de internet, le den un sentido positivo y benéfico al manejo de la información útil para el desarrollo de las personas (Blanco y Bernal, 2009), y desde luego para beneficio en especial a la Pyme manufacturera puesto que estas en todo momento buscan tener mejor desempeño y ser más competitivas (Crnjar, 2006). La gestión del conocimiento en las organizaciones pretende ser un elemento clave cuyo objetivo sea el de coadyuvar a mejorar los sistemas empresariales para tener con ello organizaciones más competitivas que puedan ser capaces de competir en un entorno dinámico y agresivo que se presenta hoy en día en el mundo de los negocios (Bergeron, 2003). Y en este sentido, es importante resaltar que los empresarios deben tener presente que el conocimiento que se genera por parte de los individuos dentro de sus organizaciones, es sustancial para el cumplimiento de los objetivos empresariales y desde luego para facilitar que la información adquiera un sentido a través de procedimientos y técnicas que los individuos requieran aprender para realizar de mejor forma sus actividades (Črnjar, 2006).

Para las empresas y para los individuos, una gestión adecuada del conocimiento generado representa una forma de desarrollar activos intangibles perdurables, donde su valor depende en cómo se deba poner en práctica según las costumbres y políticas empresariales, permitiendo que el conocimiento adquiera un valor específico (Crnjar, 2006), por lo cual, las aportaciones innovadoras que se traduzcan en la generación de conocimiento, permitirán optimizar los recursos, mejorando la operatividad de las distintas funciones, beneficiando también el desempeño del personal y con ello el de la organización en su conjunto (Dalkir, 2005). De esta manera, se encuentra en algunos estudios que la innovación es uno de los predictores de la gestión del conocimiento (Mercado, 2010), en donde las barreras a la innovación también pueden representar un obstáculo en la adecuada gestión del conocimiento, por lo cual se plantean las siguientes hipótesis:

H₁: Los Recursos Financieros, como Barrera a la Innovación, Influyen Negativamente en la Gestión del Conocimiento de la Pyme Manufacturera.

H₂: Los Recursos Humanos, como Barrera a la Innovación, Influyen Negativamente en la Gestión del Conocimiento de la Pyme Manufacturera.

H₃: El Ambiente Externo, como Barrera a la Innovación, Influye Negativamente en la Gestión del Conocimiento de la Pyme Manufacturera.

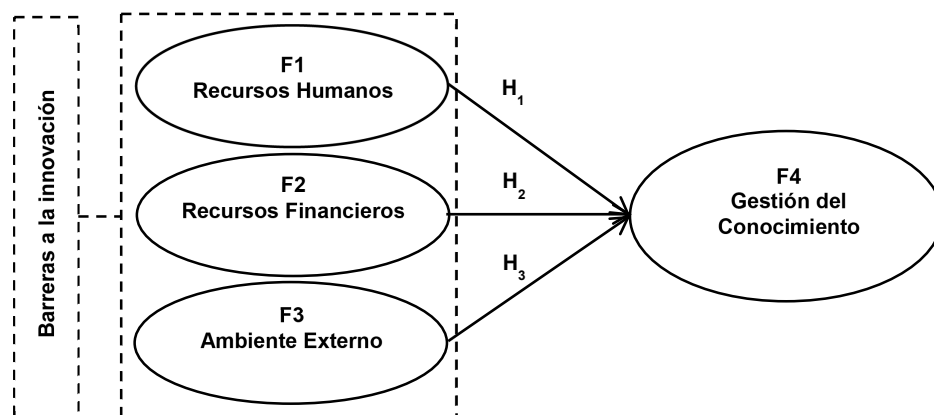

En base a esto, para medir las hipótesis establecidas, se plantea el siguiente modelo teórico:

METODOLOGÍA

Este estudio ha sido desarrollado bajo un enfoque cuantitativo, y de tipo correlacional, mediante el cual, a través de una muestra de empresas encuestadas se busca realizar análisis estadísticos correlacionales que

permitan determinar el grado de influencia que ejercen las barreras a la innovación en la gestión del conocimiento en las Pymes manufactureras del Estado de Aguascalientes. De esta manera, utilizando como referencia la base de datos que ofrece el Directorio Empresarial de Aguascalientes (Secretaría de Economía, 2012) se determina a muestra a través de un muestreo aleatorio simple resultando 150 pequeñas y medianas empresas, a las cuales se les aplicó un instrumento de medición tipo encuesta dirigida a los gerentes o responsables directos de la administración de este tipo de organizaciones durante el periodo comprendido entre los meses de abril y junio del año 2012.

Figura 1: Modelo Teórico

Esta figura muestra el planteamiento del modelo teórico utilizado en este trabajo de investigación estableciendo las relaciones entre los constructos considerados. Este modelo se plantea considerando la revisión de la literatura, en la que algunos autores establecen las relaciones aquí mostradas. Fuente: Elaboración propia adaptando el modelo de Barreras a la Innovación propuesto por Madrid-Guijarro et al. (2009).

Desarrollo de Medidas

El instrumento de recolección de datos fue conformado mediante los siguientes dos bloques: Barreras a la Innovación, y Gestión del Conocimiento. La escala que compone el primer bloque llamado Barreras a la Innovación consiste en 15 elementos medidos con escala Likert del 1 al 5 (Madrid-Guijarro *et al.*, 2009), separándolo en tres dimensiones, Recursos Humanos con cuatro elementos, Recursos Financieros con seis elementos y Ambiente Externo con cinco elementos. Para el análisis del segundo bloque denominado Gestión del Conocimiento se utilizaron 27 elementos medidos con escala Likert del 1 al 5, dividido en cuatro dimensiones, Entrenamiento de los Empleados con cinco elementos (Bontis, Chong y Richardson, 2000; OCDE, 2003), Políticas y Estrategias con 13 elementos (adaptación de Maldonado, Martínez y García, 2012 de Bozbura, 2004, 2007), Creación y Adquisición de Conocimiento Externo con cinco elementos (adaptación de Maldonado *et al.*, 2012, de las escalas propuestas por la OCDE, 2003, y Bozbura, 2007), y Efectos de la Cultura Organizacional con cuatro elementos (adaptación de Maldonado *et al.*, 2012, de las escalas propuestas por la OCDE, 2003, y Bozbura, 2007).

En la tabla siguiente se muestran los resultados de fiabilidad y validez del modelo teórico. Por una parte, los valores del coeficiente Alfa de Cronbach y el Índice de Fiabilidad Compuesta (IFC) en todos los bloques superan el nivel mínimo recomendable de 0.70 para las ciencias sociales, lo cual permite evidenciar la fiabilidad en las escalas utilizadas (Nunnally y Bernstein, 1994; Hair, Anerson, Tatham y Black, 1995). A su vez, el Índice de la Varianza Extraída (IVE) fue calculado para cada uno de los constructos y sus resultados son superiores a 0.50 (Fornell y Larcker, 1981) confirmando la fiabilidad del instrumento. Por otra parte, según los valores de la misma tabla se infiere que el modelo proporciona un buen ajuste ($S-BX^2 = 1188.6740$; $gl = 599$; $p < 0.000$; $NFI = 0.899$; $NNFI = 0.941$; $CFI = 0.947$; $RMSEA = 0.080$), todos los ítems de los factores relacionados son significativos ($p < 0.05$). Los promedios de las cargas factoriales son superiores a 0.60, lo que da evidencia suficiente para establecer la existencia de validez convergente en el modelo teórico (Bagozzi y Yi, 1988).

La validez nomológica del modelo fue analizada a través del desempeño del Test de la Chi-Cuadrada, en el cual el modelo teórico fue comparado con la medición de los datos incluidos (Hatcher, 1994). De acuerdo a los resultados obtenidos en estas pruebas se puede inferir que el modelo teórico tiene fiabilidad y validez convergente estructural para la muestra de 150 Pymes manufactureras del Estado de Aguascalientes.

Tabla 1: Fiabilidad y Validez Convergente del Modelo Teórico

Variable	Indicador	Carga Factorial Estandarizada ***	Media de la Carga Factorial Estandarizada > 0.60	Valor T-Robusto	Índice de Fiabilidad Compuesta IFC > 0.70	Índice de Varianza Extraída IVE > 0.50	Alfa de Cronbach

La Tabla 2 muestra los resultados de los análisis de fiabilidad y validez del modelo teórico obteniendo valores aceptables para ambos casos. El análisis de fiabilidad se realizó a través de los estadísticos Alfa de Cronbach, Índice de Fiabilidad Compuesta (IFC) e Índice de la Varianza Extraída (IVE). El análisis de validez se realizó a través del Análisis Factorial Confirmatorio con apoyo del software estadístico EQS v6.1. Fuente: Elaboración propia.

A su vez, la validez discriminante del modelo teórico se analizó a través de la aplicación de la prueba del intervalo de confianza y de la prueba de la varianza extraída, las cuales arrojan los resultados mostrados en la tabla siguiente. Con un nivel de confianza del 99%, ninguno de los elementos individuales de los factores latentes de la matriz de correlación contiene el valor 1.0. (Anderson y Gerbing, 1988) Por su parte, el Índice de la Varianza Extraída (IVE) entre cada par de constructos es superior que su correspondiente nivel de covarianza al cuadrado. (Fornell y Larcker, 1981)

Tabla 2: Validez Discriminante del Modelo Teórico

Variables	Gestión del Conocimiento	Recursos Humanos	Recursos Financieros	Ambiente
Gestión del Conocimiento	0.574	0.021	0.007	0.002
Recursos Humanos	-0.024	0.314	0.624	0.144
Recursos Financieros	-0.066	0.235	0.226	0.532
Ambiente Externo	-0.095	0.190	0.101	0.389
			0.146	0.422
				0.578

La diagonal representa el Índice de Varianza Extraída, mientras que por encima de la diagonal se muestra la parte de la varianza (correlación al cuadrado). Por debajo de la diagonal, se presenta la estimación de la correlación de los factores con un intervalo de confianza del 99%. En la Tabla 3 se observan los resultados relativos al estudio de la validez discriminante del modelo teórico llevado a cabo a través de la aplicación de la prueba del intervalo de confianza y de la prueba de la varianza extraída, en donde el Índice de la Varianza Extraída entre cada par de constructos es superior que su correspondiente nivel de covarianza al cuadrado, lo cual permite descartar problemas importantes de validez discriminante en el modelo teórico. Fuente: Elaboración propia.

En base a los valores arrojados en las pruebas anteriores, se puede concluir que las distintas mediciones realizadas en este modelo demuestran suficiente evidencia de fiabilidad y validez convergente y discriminante.

RESULTADOS

Posteriormente se realizó el Modelo de Ecuaciones Estructurales con apoyo del programa estadístico EQS v6.1 para comprobar la estructura del modelo conceptual y contrastar las hipótesis planteadas, utilizando las escalas de las variables mencionadas anteriormente: Barreras a la Innovación (Recursos Humanos, Recursos Financieros, y Ambiente Externo) y Gestión del Conocimiento.

Tabla 3: Resultados del MEE del Modelo Teórico

Hipótesis	Relación Estructural	Coefficiente Estandarizado	Valor T Robusto	Medidas de los Índices de Ajuste
H₁ : La Barrera de Recursos Humanos, Afecta Negativamente la Gestión del Conocimiento de la Pyme Manufacturera.	RR.HH. → Gestión del Conocimiento	-0.028***	12.086	S-BX ² =1188.6740; gl=599; p=0.000; NFI=0.899; NNFI=0.941; CFI= 0.947; RMSEA=0.080; ***=p<0.01
H₂ : La Barrera de Recursos Financieros, Afecta Negativamente la Gestión del Conocimiento de la Pyme Manufacturera.	RR.FF. → Gestión del Conocimiento	0.066***	11.915	
H₃ : La Barrera del Ambiente Externo, Afecta Negativamente la Gestión del Conocimiento de la Pyme Manufacturera.	Ambiente Externo → Gestión del Conocimiento	0.017***	10.034	

La Tabla 6 muestra los resultados del Modelo de Ecuaciones Estructurales aplicado mediante el cual se analiza la estructura del modelo conceptual y se contrastan las hipótesis planteadas de las variables independientes de las Barreras a la Innovación (Recursos Humanos, Recursos Financieros, y Ambiente Externo) y la variable dependiente de Gestión del Conocimiento. Fuente: Elaboración propia.

Con los resultados de la tabla anterior, para las hipótesis planteadas en el presente trabajo de investigación, se establece lo siguiente: Se acepta la **H₁** ($\beta = -0.028$, $p < 0.000$), lo que permite establecer que La Barrera de Recursos Humanos Afecta Negativamente a la Gestión del Conocimiento de la Pyme Manufacturera del Estado de Aguascalientes. Se rechaza la **H₂** ($\beta = 0.066$, $p < 0.000$), indicando que La Barrera de Recursos Financieros No Afecta Negativamente a la Gestión del Conocimiento de la Pyme Manufacturera.

Finalmente, la H_3 ($\beta = 0.017$, $p < 0.000$) también se rechaza, determinando que La Barrera del Ambiente Externo Tampoco Afecta Negativamente a la Gestión del Conocimiento de la Pyme Manufacturera.

CONCLUSIONES

Los resultados muestran que los recursos financieros y al ambiente externo representan barreras a la innovación que no influyen negativamente, ya que los empresarios coincidieron en que éstos no son elementos que limitan la generación y el desarrollo de conocimiento propio de la organización, considerándolos mayormente ajenos al conocimiento organizacional. Para que las Pymes puedan mejorar la gestión del conocimiento se requiere de la implementación de diversas actividades tales como un adecuado entrenamiento de los empleados, el diseño y aplicación de políticas y estrategias de gestión del conocimiento, así como la adquisición de conocimiento externo, en donde el recurso humano aborda un papel de suma importancia siendo éste el centro de enfoque de todas estas actividades.

Los resultados generados a través de este estudio son relevantes para administradores de Pymes mexicanas, y encargados del desarrollo de políticas económicas. Por una parte, los encargados de la administración de estas empresas obtendrán un mayor conocimiento de la afectación de las barreras a la innovación en la gestión del conocimiento, lo que puede guiar la realización de planes estratégicos que permitan prever y controlar con mayor precisión las distintas operaciones previendo posibles aspectos que puedan perjudicar la gestión del conocimiento repercutiendo el adecuado desempeño de la entidad económica. A su vez, los encargados del desarrollo de política económica pueden identificar aspectos que pueden o no influir negativamente en la gestión del conocimiento de las Pymes manufactureras de Aguascalientes, con la finalidad de diseñar políticas públicas que incluyan la creación y difusión de programas de capacitación y adiestramiento en donde se vinculen sectores académicos y de investigación especializados en Pymes creando espacios propicios para el intercambio de conocimiento y experiencias entre los externos y empleados de la organización.

Limitaciones y Futuras Líneas de Investigación

No se pueden considerar estos resultados como concluyentes, ya que existe la limitación de que el instrumento utilizado fue contestado desde la perspectiva del encuestado la cual puede ser subjetiva, por lo que no necesariamente pudiera reflejar la total realidad que viven las Pymes del sector manufacturero del Estado de Aguascalientes. Es por ello que sería conveniente aplicar estas encuestas a empresas de otro Estado o sector con el propósito de analizar si se repiten los resultados, hacer comparativos y con ello poder generalizar. Asimismo, futuras investigaciones podrán evaluar la posibilidad de ampliar el universo de estudio considerando a empresas de otras dimensiones, a su vez de que se pueden realizar análisis comparativos de la industria con otros sectores productivos, así como establecer nuevos constructos con las variables utilizadas para enriquecer la discusión sobre los temas relacionados.

DINÁMICA ECONÓMICA ESTATAL COMPETITIVA ENTRE BAJA CALIFORNIA, SINALOA Y CHIHUAHUA

Lizzette Velasco Aulcy, Universidad Autónoma De Baja California
Luis Alberto Morales Zamorano, Universidad Autónoma De Baja California

RESUMEN

La presente investigación presenta un análisis comparativo entre los principales estados exportadores de tomate y cebolla de México, se muestran las características y comportamiento poblacional que se ha desarrollado por entidad federativa del país, los resultados de sus actividades en competitividad presentada por el Instituto Mexicano para la Competitividad, A.C. y las principales estrategias gubernamentales en cuestiones de competitividad y desarrollo sustentable incluidas dentro de los planes estatales de desarrollo actuales con el propósito de presentar las principales tendencias en desarrollo económico sustentable del país.

COMPETITIVE DYNAMICS BETWEEN ECONOMIC BEHAVIOR OF BAJA CALIFORNIA, SINALOA AND CHIHUAHUA

ABSTRACT

This research presents a comparative analysis of the major exporting states of Mexico tomato and onion, characteristics and population behavior that has developed by state of the country, the results of its activities in competitiveness by the Mexican Institute of Competitiveness, AC and key government strategies and competitiveness issues including sustainable development within state current development plans in order to present the main trends in sustainable economic development in the country.

JEL: M20, R11, R58,

KEYWORDS: Competitiveness, Sustainable Development, Regional Economic Activity

INTRODUCCIÓN

El presente trabajo de investigación documental surge con el propósito de analizar la dinámica económica de las entidades federativas de Baja California, Sinaloa y Chihuahua, mediante la descripción de las principales características del comportamiento económico, asimismo se incluye información relevante sobre la competitividad estatal presentada desde 2008 hasta 2014, que permite ubicar a las entidades federativas dentro del ranking nacional por áreas específicas. Como parte integrante de la información se presentan datos sobre principales productos agrícolas exportados por los estados, razón por la cual fueron seleccionados al ser de los principales estados exportadores de Tomate y Cebolla, principales productos que se exportan de la región del Valle de San Quintín, Ensenada, Baja California.

Actividad Económica Regional

Durante el cuarto trimestre de 2013 el Banco de México reportó que se presentó una expansión de manera diversa de la actividad económica en las regiones de país, destacando el desempeño de la zona norte (Baja California, Sonora, Chihuahua, Coahuila, Nuevo León y Tamaulipas) que demostró un mayor dinamismo. Sin embargo el desempeño de las actividades fue a un menor ritmo en comparación con el tercer trimestre de 2013. Las demás zonas económicas del país en los diversos sectores presentaron menores tasas de

crecimiento anual en comparación con el trimestre anterior. En la zona norte las empresas dedicadas a la producción de agroquímicos, registró un aumento en la demanda de sus productos derivada del aumento en el almacenamiento de agua en presas. Las empresas que manifestaron una disminución en la demanda de sus productos fueron las productoras de bebidas frías y cerveza, y las dedicadas a la refrigeración. Las ventas al menudeo durante el cuarto trimestre de 2013 presentaron una ligera mejoría en las zonas norte, centro norte y centro, y la zona sur mantuvo una tendencia a la baja. El sector agropecuario las actividades económicas se expandieron en comparación con el año anterior en las zonas norte, centro norte y centro, ésta última de manera moderada, y en lo que respecta a la zona sur presentó una contracción de las actividades económicas.

Con referencia al sector de la construcción sus actividades disminuyeron en todas la zonas del país, exceptuando la zona centro, en comparación con el año anterior. El sector turismo se mantuvo expandiéndose en el cuarto trimestre de 2013, presentando dinámicas diferentes por regiones y actividad. Las actividades de financiamiento, provenientes de recursos propios, proveedores y banca comercial, presentaron una expansión en las zonas centro norte, centro y sur, y en la zona norte se tuvo una contracción. La confianza de los consumidores se debilitó durante el trimestre de referencia en todas las zonas del país. La opinión de los directivos empresariales sobre las reformas estructurales, en general, consideran que se avanza en la dirección correcta, manifestando la necesidad de legislación secundaria. Principales exportadores de Tomate y Cebolla en México.

Con información obtenida de la Secretaría de Agricultura, Ganadería, Desarrollo Rural, Pesca y Alimentación (SAGARPA) y de la Subsecretaría de Alimentación y Competitividad durante 2012, México se ubica en el primer lugar de exportadores de Tomate Rojo a nivel mundial con una producción de 1,553,325 miles de dólares seguido por Holanda con 1,449,207 miles de dólares y por España con 988,698 miles de dólares. Los estados que encabezan las exportaciones de tomate rojo son Sinaloa con una producción de 1,039,328 toneladas, que representan el 37% del total nacional, seguido por Baja California con una producción de 189,636 toneladas, representando el 7% del total nacional. En lo que respecta a la producción nacional de cebolla encabezando la lista de principales estados exportadores se encuentra Chihuahua con una producción de 206,044 toneladas que representan el 17% de la producción anual total, seguido de Baja California con una producción de 166,894 toneladas, que representan el 13% del total nacional.

Índices de Competitividad Estatal Generado por el Instituto Mexicano Para la Competitividad (IMCO)

	Baja California	Sinaloa	Chihuahua
Posición General en el Índice de Competitividad Estatal 2012.	10	11	7

Baja California ha presentado una estabilidad en el Índice General de Competitividad, comparativamente con los datos presentados en 2010. De 2008 a 2010 es cuando tuvo un avance en el índice ya que pasó del lugar número 13 al 10. En lo que respecta a Sinaloa los datos generados por el IMCO muestran que de 2008 a 2010 presentó un avance de la posición 12 a la 11 y se ha mantenido hasta 2012. Con referencia a Chihuahua presenta la posición número 7 lo que la ubica por encima de los dos estados anteriores. Posición que ha mantenido desde 2008.

Planes Estatales de Desarrollo

Para las entidades federativas revisadas es muy importante definir estrategias para impulsar un desarrollo sustentable estableciendo políticas públicas que eventualmente promuevan una competitividad sistémica

perdurable. En cada uno de ellos se presentan acciones que favorecen el tránsito hacia un desarrollo sustentable.

CONCLUSIONES

Para las entidades federativas presentadas en este reporte es de vital importancia impulsar un desarrollo endógeno que potencialice las capacidades para fortalecer a la sociedad y economía regionales de adentro hacia afuera permitiendo un desarrollo sustentable y sostenible. Es importante señalar que en el desarrollo endógeno el aspecto económico es importante, pero no lo es más que el desarrollo integral del colectivo y del individuo: en el ámbito moral, cultural, social, político, y tecnológico. Esto permite convertir los recursos naturales en productos que se puedan consumir, distribuir y exportar al mundo entero.

Las entidades federativas debieran impulsar el desarrollo endógeno que tenga como objetivos promover, garantizar y fomentar el desarrollo armónico y coherente de las políticas, planes y proyectos de nivel Nacional. Coordinar acciones con los demás organismos del Poder Público, directa o indirectamente vinculados a los objetivos del Fondo, en especial con aquellos cuyas competencias sean necesarias. Promover la formación y asistencia necesaria a las organizaciones de la economía comunal y solidaria, para afianzar su desarrollo y consolidación como base fundamental y primaria del sistema económico nacional. Promover el uso eficiente y responsable de los recursos que se otorguen para el financiamiento de planes y proyectos. Promover y contribuir con la capacitación y formación de las organizaciones de la comunidad y de la economía solidaria, impulsando su participación corresponsable en los planes y proyectos de desarrollo endógeno, así como en la contraloría social responsable. Financiar planes y proyectos destinados a fortalecer la estructura y la capacidad productiva nacional, a través de organizaciones de la comunidad y de la economía comunal y solidaria, en concordancia con las políticas y planes que dicte el Ejecutivo Nacional sobre la materia.

INFLUENCIA DE LA OFERTA DE ACTIVIDADES DE ENOTURISMO EN LA COMPETITIVIDAD DE LAS MICRO, PEQUEÑAS Y MEDIANAS VINÍCOLAS DE LA RUTA DEL VINO DEL VALLE DE GUADALUPE, B. C., MÉXICO

Lino Meraz Ruiz, Universidad Autónoma de Baja California
Sonia Elizabeth Maldonado Radillo, Universidad Autónoma de Baja California

RESUMEN

Este trabajo se caracteriza por ser de tipo descriptivo-correlacional, con diseño no experimental, que sigue un modelo mixto: cualitativo-cuantitativo, cuyo objetivo es describir cómo la oferta de actividades de enoturismo se correlaciona con la competitividad de las micro, pequeñas y medianas empresas vinícolas de la Ruta del Vino del Valle de Guadalupe, en Baja California. Para lograrlo, la estrategia metodológica se basó en tres etapas: a) en la primera se hizo una selección rigurosa de la muestra de estudio; b) en la segunda se diseñó un instrumento de medición para la recolección de la información; y, c) en la tercera, se realizó el procesamiento e interpretación de datos a través de pruebas estadísticas y análisis de contenido y de correlación. Obteniendo una correlación positiva muy débil con el coeficiente Spearman (r) de 0.126 con un nivel de significancia de 0.398 entre las variables, refutándose la hipótesis planteada y dejando abierta la posibilidad de continuar con futuras investigaciones en el tema del enoturismo.

INTRODUCCIÓN

Actualmente, el turismo se encuentra en busca de nuevas y mejores formas de dedicar su tiempo para vacacionar, dejando atrás las modalidades convencionales como son la de sol y playa, casinos, y parques de diversiones. Ahora, se aprecia un creciente interés por el desarrollo de nuevas opciones de turismo, surgiendo un sinnúmero de alternativas y novedosas formas de viajar dirigidas a turistas más exigentes, quienes optan por otro tipo de experiencias, como viajes cortos de menor duración, dirigidos al gusto cultural, religioso, del vino y la gastronomía (Elías, 2009; Rodríguez et al., 2010). Por su parte, en el estado de Baja California la República Mexicana (México) se ubican alrededor de 98,615 unidades económicas (INEGI, 2010), de las cuales el 99.5% son MIPYME, representando el 91.6% a las micro, el 6.2% a las pequeñas, y el 1.7% a las de tamaño mediano, y que en conjunto emplean al 68% del personal ocupado en el territorio (Moreno, 2011).

En este sentido, al referirse a empresas dedicadas a la producción de vino, inmersas en un área geográfica donde las condiciones son ideales para el cultivo de la vid, se vuelve necesario que estimulen el desarrollo económico-social a través del turismo (Briedehann y Wickens, 2003) mediante la oferta de productos y servicios de interés, existentes y potenciales, donde el vino se convierte en el principal motivo de sus viajes. No obstante, en años recientes, se ha visto el cierre de un gran número de empresas a causa de la fuerza que emana de la competencia internacional y los mercados globalizados, lo que ha llevado al replanteamiento de las estrategias que les permitan desarrollar mejores condiciones económicas y sobrevivir ante las crisis financieras (González, Aguilera, y Vivanco, 2012; López y Marín, 2011).

Aunado a lo anterior, se suma la baja en cuanto a competitividad, lo que lleva a la búsqueda de estrategias competitivas que posibiliten el crecimiento económico, la mejora de la calidad de vida de la sociedad y la supervivencia de las empresas, de acuerdo a información del *The Global Competitiveness Index* en López, Marín, y Moreno (2012).

Así, al tratarse de empresas enmarcadas por elaborar y producir vino, siendo ésta una actividad de índole turística, y asentadas en la principal zona vitivinícola de México (Meraz, 2009), se vuelve necesaria la falta de una diversificación más amplia en cuanto a la oferta de actividades de enoturismo entorno a la experiencia de la cultura del vino y del turismo en la zona (Ruiz y Pelegrín, 2011). Cabe resaltar que este tipo de turismo se caracteriza por su hecho diferencial competitivo y su complementariedad con la oferta turística ya existente, que funge como una herramienta para el desarrollo rural de la zona (López-Guzmán y Sánchez, 2008; Medina y Tresserras, 2008, Millán y Melián, 2008; Rodríguez et al., 2010; Zamora y Barril. 2007). Por lo anterior, y debido a la falta de estudios que den respuesta a la problemática aquí planteada, se vuelve necesario llevar adelante trabajos de carácter científico que permitan identificar las estrategias que detonen el desarrollo competitivo empresarial de la región. Es por ello que se expone la presente investigación, cuyo ámbito corresponde a las MIPYME del sector vitivinícola de la Ruta del Vino del Valle de Guadalupe, en Baja California, México, la cual tiene por objetivo describir cómo la oferta de actividades de enoturismo se correlaciona con la competitividad de las micro, pequeñas y medianas empresas vinícolas situadas geográficamente en la Ruta del Vino del Valle de Guadalupe. Teniendo como hipótesis que: “A mayor oferta de actividades de enoturismo de las micro, pequeñas y medianas empresas vinícolas de la Ruta del Vino del Valle de Guadalupe, mayor será la competitividad”.

METODOLOGÍA

Este trabajo se basó en un estudio descriptivo-correlacional, que sigue un modelo mixto (cualitativo-cuantitativo), con diseño no experimental, ya que pretende establecer una descripción y correlación de datos para probar la hipótesis previamente planteada. La selección de la muestra y por delimitación del estudio fue no probabilística.

Para medir el nivel de competitividad de las MIPYME vinícolas se diseñó un cuestionario en el que se establecieron un conjunto de ítems agrupados en dos variables (Oferta de actividades de enoturismo, con 14 ítems, y Competitividad, con 22 ítems). Los niveles de medición utilizados para los ítems que integran el cuestionario fueron de orden nominal, ordinal y de escala.

El método de escalamiento fue de tipo Likert (1932) en Hernández, Fernández, y Baptista (2010), empleando tres tipos diferentes, el primero: (1) Nada importante, (2) Poco importante, (3) Importante, (4) Muy importante, y (5) Totalmente importante; el segundo: (1) Totalmente en desacuerdo, (2) En desacuerdo, (3) Ni de acuerdo ni en desacuerdo, (4) De acuerdo, y (5) Totalmente de acuerdo; y, el tercero: (1) Aumentó, (2) Permaneció estable, y (3) Disminuyó. El análisis de los resultados se determinó a través del análisis de frecuencias; por medio del uso de diagramas de dispersión, caracterizados por una serie de puntuaciones que por sus posiciones materializa si la relación es en línea recta, teniendo en cuenta que cuando más recta sea la línea más fuerte es la relación, lo cual está vinculado con el coeficiente (r) de Spearman (Camacho-Sandoval, 2008; Hernández et al., 2010); y, mediante el empleo del método rho de Spearman, utilizado cuando se desea establecer pruebas de hipótesis o estimar intervalos de confianza del coeficiente de correlación, aplicando valores discretos y con jerarquía ordinal entre dos variables (Salinas, 2007). Hay que tener en cuenta que el coeficiente de correlación Spearman arroja valores próximos a 1 que indican una correlación positiva perfecta, valores próximos a -1 que indican una correlación negativa perfecta, y valores próximos a 0 que significan que no existe correlación entre las variables (Hernández et al., 2010; Martínez et al., 2009).

RESULTADOS

Del total de las MIPYME que respondieron al cuestionario, con respecto al tamaño de las empresas vinícolas, y tomando como base la clasificación propuesta por INEGI (2011), el 59.4% son micro, siendo estas la gran mayoría; enseguida, el 18.8% son pequeñas; y, el 10.9% corresponde a las medianas. En cuanto a la oferta de enoturismo, el 82.1% constató que durante los últimos cinco años si se ha involucrado en este tipo de actividades, en cambio, el 17.9% no las ha desarrollado. Y, referente a las temporadas en que ofrecen las actividades de enoturismo, el 87.2% indicó que las realiza durante todo el año, y el 12.8% que únicamente las desarrolla durante las fiestas de la vendimia, principalmente entre los meses de junio y agosto.

Tratándose del grado de importancia en relación al tipo de actividad de enoturismo puesta en marcha por parte de las empresas vinícolas, el 55.3% de los vinicultores aseguró que es importante, y la otra parte, el 44.7% señaló que es poco importante. En relación al efecto que tuvieron las actividades de enoturismo sobre sus resultados, el 55.3% de los vinicultores afirmó que éstos aumentaron después de haber llevado a cabo las actividades de enoturismo; por el contrario, para el 44.7% permanecieron estable, y, nadie lo catalogó como una disminución en sus resultados obtenidos.

Por lo que se refiere a la competitividad, el 83.9% de los vinicultores opina que sí han mantenido una estrategia para competir en el mercado, y únicamente el 16.1% no cuenta con el establecimiento de dicha estrategia competitiva. Con respecto a la implementación de las estrategias de competitividad de las micro, pequeñas y medianas empresas vinícolas, el 53.7% de los vinicultores comentó no estar de acuerdo ni en desacuerdo, el 44.4% de acuerdo, y el 1.9% en desacuerdo.

En cuanto al grado de correlación Spearman entre la competitividad y la oferta de actividades de enoturismo, se obtuvo un índice de .126 con un nivel de significancia de 0.398, lo que indica una correlación positiva muy débil, de acuerdo con la escala que propone Hernández et al. (2010). Por su parte, el diagrama de dispersión denotó una tendencia en la variación de los puntos de forma elíptica o circular, concluyendo que no existe una relación lineal significativa, dado la incongruencia a simple vista de que no hay forma de encontrar una línea recta a la que se pueda hacer una aproximación de los puntos. En este sentido, se rechaza la hipótesis alternativa y, en contraparte, se acepta la hipótesis nula (H_0), confirmándose la poca asociación entre las dos variables (Manterola y Pineda, 2008).

CONCLUSIONES

Este trabajo consistió en un estudio descriptivo-correlacional, que sigue un modelo mixto, con diseño no experimental. En el que se obtuvo una correlación positiva muy débil (coeficiente Spearman de 0.126) entre las variables de la oferta de actividades de enoturismo y competitividad, aceptándose la hipótesis nula, es decir, que no existe asociación entre las variables estudiadas, cumpliéndose satisfactoriamente con el objetivo de la investigación.

Constituyendo como una importante aportación para el sector, especialmente si se considera la escasez de estudios que aborden la problemática analizada en las empresas vinícolas. Denotando que el enoturismo es un elemento importante pero no esencial para impulsar la competitividad de las región vitivinícola del Valle de Guadalupe. Por lo que, se intentará proponer futuras investigaciones a través de estudios comparativos que permitan presentar soluciones a las discrepancias observadas y como resultado del análisis estadístico, en la que se pueda definir el mejor método para la estimación más confiable y realista de las ofertas de actividades de enoturismo que ofrecen las vinícolas de la Ruta del Vino del Valle de Guadalupe, B.C., México.

RESUMEN

Acorde con la literatura publicada en las áreas de administración y negocios internacionales, el papel del gerente en la organización juega un rol fundamental para el alcance de las metas a corto y largo plazo en los procesos de internacionalización empresarial. Sin embargo, los logros de las compañías se pueden ralentizar dependiendo del enfoque gerencial asumido en los procesos de gestión. Esto, en la mayoría de los casos, presenta una relación de causalidad con las características del líder del equipo negociador, el cual coincide con el rol gerencial. En este sentido, para el análisis del proceso de expansión hacia nuevos mercados, desde la perspectiva de las competencias gerenciales, conviene establecer tanto su abordaje teórico y pragmático, como los tipos de metodologías empíricas, principalmente de corte cualitativo, que han sido empleadas para abordar problemas referentes al contexto de tales decisiones en un mundo global. La literatura muestra que desde los enfoques relacionados con el rol del gerente, existen múltiples posturas que van desde el momento de la decisión, la percepción de incertidumbre y propensión al riesgo del equipo negociador, hasta el entorno de la firma, sus conexiones internacionales y su contribución a los procesos de internacionalización, y las restricciones sobre las acciones del tomador de decisiones. Por su parte, las técnicas aplicadas presentan una amplia variedad desde la evaluación de competencias gerenciales globales, evaluación de desempeño, hasta criterios de selección para diferentes áreas de una empresa estándar (personal, proyectos, proveedores, tecnologías).

INTERNATIONALIZATION FIRM: MANAGER CAPABILITIES AND APPLIED METHODS, AN ANALYTICAL REVIEW

ABSTRACT

According to the literature published in the areas of management and international business, the manager's role in the organizations plays a fundamental role in the outcome of internationalization processes in short and long term. However, the organization's accomplishments can be influenced by the manager, which in most cases, is linked to the capabilities of the leader of the internationalization team. In this sense, in the internationalization process from managerial capabilities perspective it should be established not only the theoretical and pragmatic approach but also the empirical methodologies used, primarily qualitative cutting, in addressing problems relating to the decisions business contexts. The literature shows that there are multiple positions from the approaches related to the manager's role, ranging from the time of the decision, the perception of uncertainty and risk propensity of the negotiating team, to the environment of the firm, its international connections and its contribution to the process of internationalization, and restrictions on the actions of the decision maker. Meanwhile, methodologically issues includes development

of global management skills, performance evaluation, and selection criteria for different areas of a standard company (employees, projects, vendors, technologies).

INTRODUCCIÓN

En medio del desempeño cotidiano de las empresas, se encuentra el papel del gerente con relación directa en el cumplimiento de los objetivos corporativos, por ende, en el crecimiento de la organización. En este sentido, “la gerencia es el elemento clave en el desempeño y supervivencia organizacional” (Hernández & Gómez, 2010, p.628). Si bien en las grandes empresas el rol del gerente es importante, el acompañamiento recibido de cada una de las áreas funcionales y demás recursos organizacionales, lo soportan para que su desempeño tenga una mayor probabilidad de éxito. En el caso de las pequeñas y medianas empresas (pymes), se gira en torno al principio de la escasez como producto de recursos limitados y donde los resultados de corto y mediano plazo marcan el horizonte de planeación, el gerente cumple una función trascendental en el logro de los objetivos, como eje articulador que transmite sus propias redes empresariales y direcciona los recursos de la organización con base en criterios derivados de su formación personal, académica y profesional para el proceso de la toma de decisiones.

Ahora bien, la internacionalización de las empresas, ha sido uno de los principales temas de investigación en los negocios internacionales. Este concepto, lo define Galván (2003) como el “conjunto de operaciones que facilitan el establecimiento de vínculos más o menos estables entre la empresa y los mercados internacionales, a lo largo de un proceso de creciente implicación y proyección internacional”. En general, se puede esperar que la internacionalización esté asociada y dependa de la evolución a lo largo de dimensiones como: las operaciones en el extranjero, objeto de venta, mercados, estructura organizacional, personal y finanzas. Así, durante la internacionalización de las empresas, se presentan diversas perspectivas que logran explicar la forma como las firmas realizan dicho proceso. Esto dependerá del tamaño de la empresa, su experiencia, la perspectiva de sus gerentes, así como los modos de entrada que estas utilizan. Este trabajo está dividido en cinco secciones incluida la introducción; la segunda, señala el procedimiento metodológico empleado; la tercera, muestra la revisión general en el tema; la cuarta presenta los resultados de la literatura seleccionada; por último, se presenta una reflexión en torno a esta revisión.

METODOLOGÍA

Con el fin de determinar el perfil del gerente en la organización, en este documento se revisan artículos indexados en la base de datos de *Scopus* que han estudiado las diversas características que posee el gerente y su contribución a la internacionalización de las empresas. Easterby-Smith et al. (2002), aduce que la revisión de la literatura académica muestra ser un método válido en investigación, al permitir estructurar un campo de investigación y forma parte integral de cualquier investigación conducida. Luego, bajo esta perspectiva, la revisión priorizó y clasificó las publicaciones con el fin de identificar las brechas, problemas y oportunidades; así como el abordaje empírico para el desarrollo de la investigación. Es de aclarar que la revisión que se presenta pretende mostrar de modo general el abordaje del problema en la literatura seleccionada. Ahora bien, con el fin de alinear el análisis bibliográfico se utilizaron los siguientes criterios para depurar la información: i) eje orientador: la relación entre características gerenciales e internacionalización, como centro o foco del estudio; ii) horizonte temporal: revisión de publicaciones a partir del año 1990, dado que como área y tema de investigación es reciente, y los trabajos destacados se publicaron a partir de ese año; iii) tipo de publicaciones: artículos científicos, documentos de trabajo y

artículos de opinión; y iv) tipo de documentos: la revisión contempló visiones teóricas y conceptuales, estudios de tipo aplicado con metodologías empíricas, y estudios de revisión analítica o literaria.

REVISIÓN DE LITERATURA

Las pymes que entran en el ámbito internacional son cada vez más comunes en todo el mundo (Wickremesooriya & S.P., S.F.). Según el modelo propuesto por Bachal, Jawad, Shaikh, Shaikh & Afridi (2011), la internacionalización de las pequeñas y medianas empresas dependerá de los factores organizacionales efectivos, los cuales se muestran en el Figura 1.

Figura 1: Modelo Conceptual de la Internacionalización Organizacional de las Pymes

Fuente: Elaboración propia con base en información tomada de (Bachal et al., 2011)

Los factores organizacionales se refieren a fuerzas que operan al interior de la empresa y afectan (positiva y negativamente) su velocidad y nivel de internacionalización, tales como las características del equipo de alta dirección, las variables relacionadas con la empresa y los recursos de la empresa (Bachal et al., 2011). En cuanto a los recursos de internacionalización de la empresa, el modelo propone recursos tangibles e intangibles, con base en una compilación de la identificación de recursos por parte de académicos que estudian este tema, como se muestra en la Tabla 1.

Tabla 1: Recursos Que Intervienen en la Internacionalización de Pymes

Recursos tangibles	Autores
Calidad industrial	(Holmlund and Kock 1998)
Mayor proporción de ventas ligado a Investigación y Desarrollo	(Burgel and Murray 1998)
Mayor proporción de empleados que gastan al menos el 50% de su tiempo en desarrollo de nuevos productos, recursos financieros y de capital	(Holmlund and Kock 1998)
Subvenciones recibidas de la industria	(Westhead, Wright and Ucbasaran 1998)
Acceso a capital de riesgo	(Burgel and Murray 1998)
Recursos hardware como maquinaria, edificios, equipos, materia prima y transporte	(Bachal Jamali, Jawad, Shaikh, Shaikh, & Afridi, 2011)
Recursos intangibles	Autores
Reputación (imagen, marca, lealtad, confianza, buen nombre)	(Zahra, Matherne and Carelton 2003)
Redes extensas	(Oviatt and McDougall 1995)
Redes tecnológicas	(Zahra, Matherne and Carelton 2003)
Relaciones con instituciones de investigación, universidades y organizaciones expertas varias, y redes sociales	(Bachal Jamali, Jawad, Shaikh, Shaikh, & Afridi, 2011)
Recursos software que incluye el conocimiento sobre tecnología de salida, procesos de manufactura, maquinaria, marketing, compradores y proveedores	(Holmlund and Kock 1998)
Recursos de personal	(Bachal Jamali, Jawad, Shaikh, Shaikh, & Afridi, 2011)

Fuente: Elaboración propia con base en información tomada de (Bachal et al., 2011)

Por último, las características del *top management team* o ‘equipo encargado de la alta dirección, la “unión central” de individuos responsables de la dirección de la firma identifica problemas y oportunidades en el entorno, interpreta información relevante, considera las capacidades y limitaciones organizacionales, y formula e implementa el cambio estratégico (Mitzberg, 1979, citado por (Wiersema & Bantel, 1992). Bachal et al. (2011), dividen estas características en objetivas y subjetivas de la siguiente manera:

Tabla 2: Características del EAD Que Intervienen en la Internacionalización de Pymes

Características objetivas	Autores
Diversos conocimientos en gestión	(Westhead, Wright and Ucbasaran 2001),
Número de idiomas hablados si el que toma las decisiones nació, vivió o trabajó en el extranjero	(Bijmolt and Zwart 1994; Reuber and Fischer 1997)
Experiencia laboral extranjera	(Burgel and Murray 1998)
Estudios en el extranjero	(Burgel and Murray 1998)
Antecedentes de padres con experiencia gerencial	(Westhead, Wright and Ucbasaran 1998)
Habilidad para formar redes formales e informales	(Mughan, Lloyd-Reason, & Zimmerman, 2004)
Características subjetivas	Autores
Alta percepción de ventajas de exportación y baja percepción de barreras de exportación	(Calof and Beamish 1995; Rundh 2003)
Las características de la personalidad del propietario-gerente tales como la creatividad, innovación, toma de riesgos y proactividad	(Fillis 2001)
La falta de visión global	(Oviatt and McDougall 1995)

Fuente: *Elaboración propia con base en información tomada de (Bachal et al., 2011)*

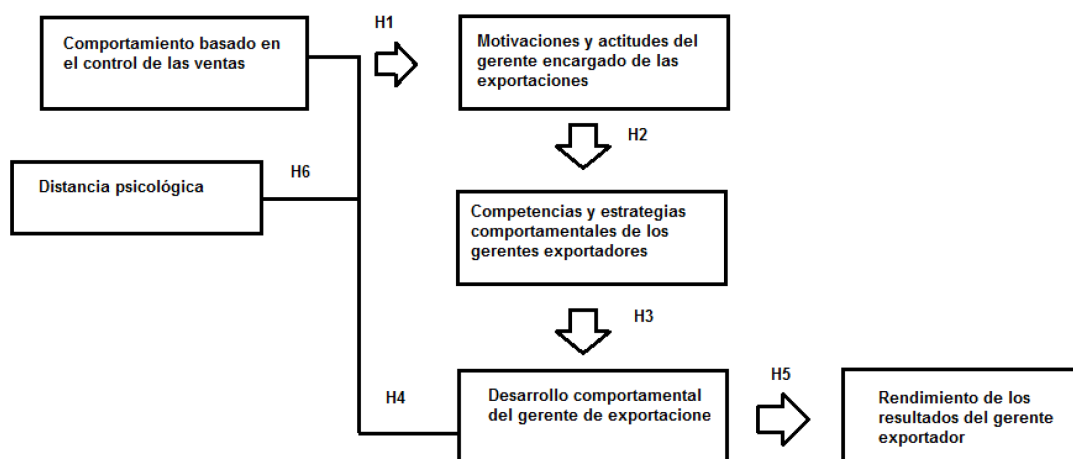

RESULTADOS

Esta sección presenta los resultados de la revisión bibliográfica. Uno de los trabajos pioneros en el tema es el estudio realizado por Roth (1995), quien argumenta que las principales características que permiten a un gerente desarrollar lazos de interdependencia en el mercado global a través de los procesos de internacionalización son: i) foco de control interno, ii) tendencia a la recopilación de información para la solución de problemas (sensación, intuición, pensamiento y sentimientos), iii) experiencia funcional (mercadeo y ventas), y iv) antecedentes internacionales. Según los hallazgos de la investigación elaborada por el autor, estas características influyen en el desempeño a excepción del uso de emociones y sentimientos para la solución de problemas. Magnusson y Boggs (2006) partieron de la teoría de los Altos Mandos para determinar si las características demográficas de los gerentes pueden ser determinantes para la selección de cargos gerenciales en empresas inmersas en entornos internacionales.

Los autores encontraron que los candidatos con experiencia internacional cuentan con mayores probabilidades de ser elegidos para dichos cargos. De igual manera, identificaron que existe una relación positiva entre el grado de internacionalización de la empresa y la experiencia internacional del gerente. En este estudio fueron consideradas otras características como la edad, permanencia en el cargo, antecedentes de marketing y financieros, educación y experiencia internacional en cargos previos (número de años, países y distancia cultural). Sapienza et al. (2006) utilizan el modelo de capacidades dinámicas para explicar las rutinas organizacionales y estratégicas en las cuales el gerente altera la base de recurso de las empresas a través de la adquisición y generación de nuevas estrategias de creación de valor. Para los autores, en la medida en que un gerente cuenta con experiencia de gestión en procesos de internacionalización en empleos previos, aumentan las probabilidades de lograr una asertiva supervivencia empresarial para el sostenimiento en los mercados internacionales. Acorde con los autores: “el conocimiento implícito en la experiencia de gestión previa a la internacionalización, ya sea individual o conjuntamente, influirá en los resultados de la

internacionalización, independiente de los efectos de la edad de la empresa” (p.923). En una investigación desarrollada por Theodosiou y Katsikea (2007), los autores plantean que el desarrollo de un comportamiento basado en ventas por parte de los gerentes de las pymes genera consecuencias favorables en los procesos de exportación. Allí se argumenta que “los ejecutivos exportadores tienen la oportunidad de influenciar la organización a través de sus características propias en el área de exportación de ventas a través de un rol directivo y de control en las actividades de ventas” (p.1270). Dentro de las características gerenciales halladas en la investigación se encuentran: i) un alto grado de control en la gestión de ventas, ii) un alto grado de motivación y actitud, iii) competencias y estrategias comportamentales en el proceso de exportación y un alto rendimiento de ventas de exportación. Theodosiou y Katsikea (2007) plasman dichas características en el Figura 2, donde las hipótesis uno a cinco fueron aceptadas, mientras la sexta, la que enlaza las características gerenciales con la distancia psicológica, fue rechazada.

Figura 2: Modelo Conceptual de las Características Gerenciales de los Gerentes Exportadores

Tomado de: Theodosiou y Katsikea (2007, p.1263)

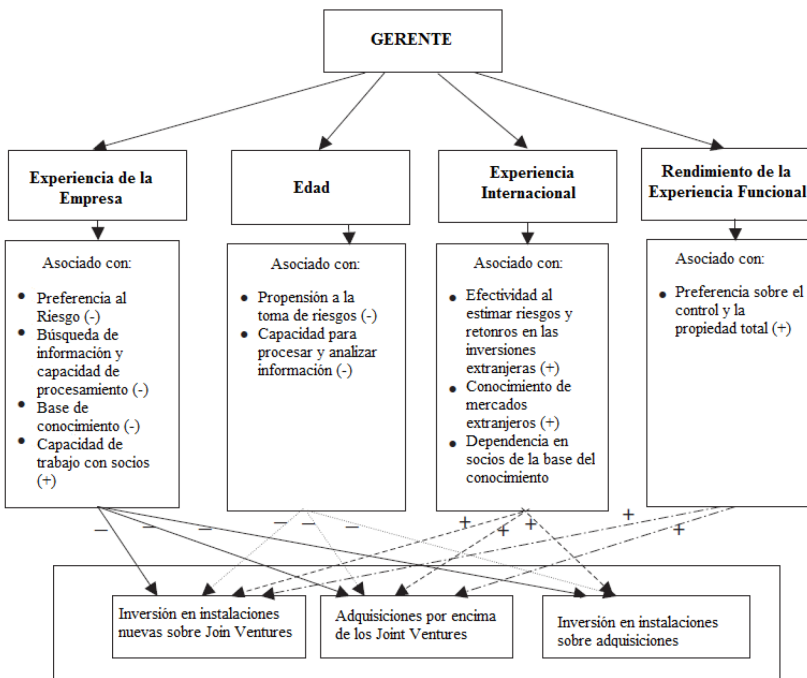

De otro lado, Hsu, Chen y Cheng (2013) desarrollan un importante estudio de investigación en el que identificaron una relación positiva entre las características gerenciales y el proceso de internacionalización de las pymes en Taiwán. Dentro de los hallazgos desarrollados, los investigadores descubrieron que a medida en que aumenta la edad del gerente es menos probable que la organización se involucre en actividades internacionales. Esto se debe a que el gerente posee menos resistencia física y mental, lo cual los hace más adversos al riesgo. De igual manera, los autores identifican que el nivel educativo y la experiencia internacional del gerente tienen un impacto positivo entre la internacionalización y desempeño de la organización. Herrmann y Datta (2006) estudiaron las repercusiones de las características del gerente en las operaciones de internacionalización de las empresas, y hallaron que en la medida en que éste cuenta con menor experiencia en la empresa, tiende a realizar mayores adquisiciones e inversiones en nuevas instalaciones en inversión extranjera directa como modo de entrada. De otro lado, los gerentes con más edad son más propensos a realizar operaciones de *joint ventures* que adquisiciones. De cualquier manera, los gerentes más experimentados internacionalmente preferirán modos de entrada a través de inversiones en nuevas instalaciones por encima de operaciones como adquisiciones *joint ventures*. Estos resultados se presentan en los Figuras 3 y 4.

Figura 3: Experiencia del Gerente E Impacto en la Elección del Modo de Entrada

	← Más Bajo	→ Más Alto
Control	Joint Ventures Control compartido entre empresas	Adquisiciones e inversiones en instalaciones nuevas La propiedad genera control estructural
Riesgo	Joint Ventures Empresas aliadas se amortiguan desde el riesgo político. El riesgo es compartido entre socios de Joint Venture	Inversiones en instalaciones nuevas La empresa asume el riesgo total y anexa capacidad de mercado. Incertidumbre al considerar ingresos, costos y ganancias. Mayor exposición a riesgos políticos y otros.

Figura 4: Experiencia del Gerente E Impacto en la Elección del Modo de Entrada

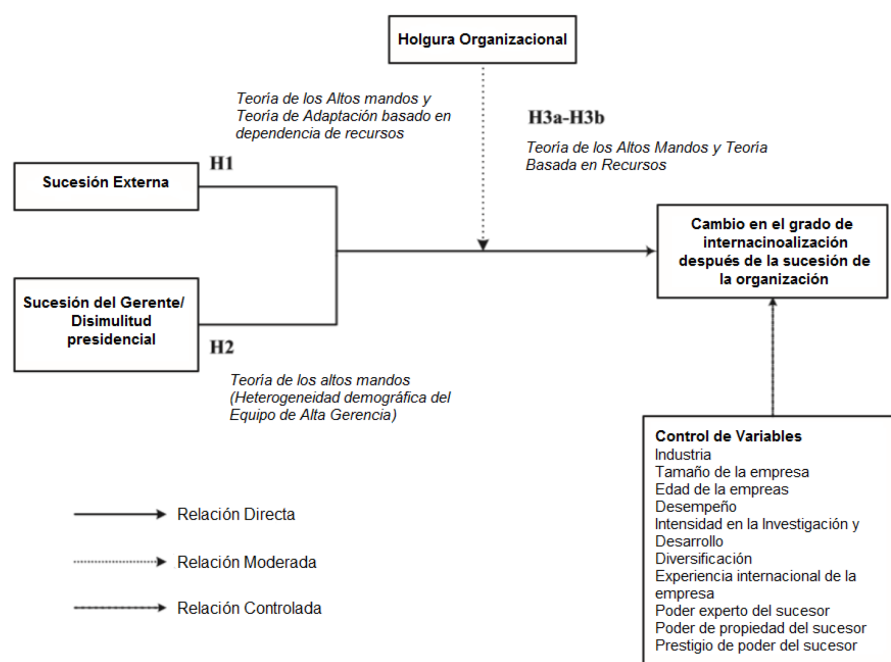

Tomado de: Herman y Datta (2006, pág. 766)

Por su parte, la sucesión externa o internacional de los gerentes tiende a reflejar una inclinación de compromiso al cambio. Este mismo estudio fue desarrollado por Herrmann y Datta (2002), quienes identificaron que la permanencia del gerente, el nivel educativo, los antecedentes laborales funcionales y la

experiencia internacional, son factores que influyen las labores de internacionalización de una empresa de manera positiva, y se configuran como características elementales para la sucesión de nuevos gerentes. Liu, Lin y Xue (2011) estudiaron la propiedad del gerente sobre la organización y su capacidad para orientar una estrategia que aliente la internacionalización de la empresa en mercados emergentes. Dentro de los hallazgos de esta investigación se infiere que en aquellas empresas de mercados emergentes, un incremento en la propiedad del gerente sobre la organización está relacionado positivamente con una actitud emprendedora del mismo, lo cual está positivamente relacionado con el nivel de internacionalización.

Por su parte, Lin y Liu (2012) estudiaron el proceso de sucesión de gerentes en la organización y sus repercusiones en el proceso de internacionalización existente en la misma. En este sentido, ahondaron en el efecto de las características del gerente sucesor y sus repercusiones en el cambio en el grado de internacionalización de la empresa. Las características gerenciales consideradas para este estudio se centran en analizar la permanencia en el cargo (tenure) del gerente, su edad y sus antecedentes académicos (grado educativo, formación en el exterior y membresía familiar). Como particularidades propias del gerente, los autores mencionan el poder de propiedad, el poder de experto y el prestigio del poder. A continuación, en la Figura 5 se presenta la caracterización realizada por Lin y Liu (2012) en torno a la investigación que desarrollaron.

Figura 5: La Sucesión del Gerente a Partir de Fundamentos Teóricos

Tomada de: Lin y Liu (2012, pág. 95)

De otro lado, lo que los autores denominan como “dualidad”, es decir, cuando “un gerente desarrolla actividades como gerente y presidente de junta” (Hsu, Chen, & Cheng, 2013, pág. 4), es posible identificar que el desempeño de la internacionalización de la empresa es menor que en aquellas situaciones en que el gerente se enfoca directamente a las actividades internacionales. Los autores también consultaron el grado de correlación entre la recolección y el procesamiento de información en torno al proceso de internacionalización de la empresa sin encontrar resultados precisos. Un estudio similar realizó Xie (2014), al profundizar en la Teoría de los Altos Mandos para explicar la relación entre las características gerenciales y los resultados en los procesos de internacionalización. Su estudio demuestra que en la medida que los gerentes presenten mayor permanencia en su cargo, mayor será el control que realicen sobre la organización

y por lo tanto el gerente tenderá a asumir mayores riesgos. En este sentido, la investigación soporta una actitud positiva hacia la dualidad del gerente. De otro lado, el autor también resalta que la experiencia internacional del gerente, educación y edad, y la experiencia internacional de la empresa y su tamaño, logran un impacto positivo en el control total de la organización por parte del gerente.

LA CADENA DE VALOR EN LA PRODUCCIÓN DE COLES DE BRUSELAS EN LAS EMPRESAS AGRÍCOLAS DEL VALLE DE SAN QUINTÍN, BAJA CALIFORNIA

Alma Lourdes Camacho García, Universidad Autónoma de Baja California
Luis Alberto Morales Zamorano, Universidad Autónoma de Baja California
Lizzette Velasco Aulcy, Universidad Autónoma de Baja California

RESUMEN

Cada empresa representa un conjunto de actividades que realizan para diseñar, elaborar, producir, llevar al mercado, distribuir y vender sus productos. Todas estas actividades pueden ser llevadas a cabo usando una cadena de valor. La cadena de valor de cada empresa refleja la estrategia, enfoques para analizar costos, diferenciación del producto, y así crear la ventaja competitiva. La cadena de valor en el sector agropecuario, puede definirse como el conjunto de actividades que provocan un valor agregado al producto por medio de sus vínculos, procesos, información, conocimientos, logística, recursos y comercialización, desde la etapa de la producción hasta el consumidor final. A partir de la importancia de la "cadena de valor" para lograr una ventaja competitiva sostenible, las empresas productoras de las Coles de Bruselas en el Valle de San Quintín, Baja California, se enfocan en los atributos, nichos de mercado y comportamiento como actividades de valor, que sirven como fuente potencial para buscar el liderazgo y diferenciación de las empresas agrícolas establecidas en el Valle de San Quintín, ubicado al sur de la ciudad de Ensenada, Baja California, México. El estudio se realizó en el año 2014, seleccionándose por muestreo intencional, a 4 productores de la col de Bruselas en el Valle de San Quintín, Baja California, a los cuales se les aplicó encuestas, se aplicó también el método de observación a 2 de estos agentes participantes; así también el método de entrevista, que permitió conocer directamente las opiniones de los productores.

PALABRAS CLAVES: Cadena de Valor, Diferenciación del Producto, Ventaja Competitiva, Nichos de Mercado, Liderazgo

VALUE CHAIN IN BRUSSELS SPROUTS PRODUCTION COMPANIES IN AGRICULTURAL VALLEY SAN QUINTIN, BAJA CALIFORNIA

ABSTRACT

Each company represents a set of activities performed to design, develop, produce, bring to market, distribute and sell their products. All these activities can be carried out using a value chain. The value chain of each company reflects the strategy, approaches to analyze costs, product differentiation, and so, create competitive advantage. The value chain in the agricultural sector can be defined as the set of activities that cause a value to the product through their links, processes, information, knowledge, logistics, resources and marketing, from the stage of production to the consumer end. From the importance of the "value chain" to achieve sustainable competitive advantage, companies producing the Brussels sprouts in the Valle de San Quintin, Baja California, focus on the attributes, market niches and behavior as activities value, which serve as a potential source to find leadership and differentiation of agricultural companies established in the Valley of San Quintin, located south of the city of Ensenada, Baja California, Mexico. The study was conducted in 2014, selected by purposive sampling, 4 producers Brussels sprouts in the Valle

de San Quintin, Baja California, to which they applied surveys, observation method was also applied to 2 these participating agents; so the interview method, which allowed the views directly from producers.

INTRODUCCIÓN

Los empresarios, a lo largo de la cadena de valor, se enfrentan a nuevos fenómenos tales como la biotecnología, donde los Organismos Genéticamente Modificados crean nuevas oportunidades para los agricultores, con mayores rendimientos, pero también a una segmentación entre los consumidores, cada vez más sensibles a los escándalos alimentarios y a los nuevos productos. Sin embargo, la realidad ha mostrado el importante papel que puede jugar dando un valor añadido al consumidor. Ello implica conocer sus preferencias y ganar su confianza para lo cual debe conseguir eficiencia en la gestión y desarrollar estrategias de marketing adecuadas. Con este planteamiento, la cadena de valor permite redireccionar los productos desde la fase de producción, a los segmentos de mercado que realmente los demandan, sin costo adicional y en el tiempo adecuado.

Figura 1: Esquema de la Cadena de Valor (Cadena Alimentaria)

En este caso, la ventaja no surge sólo de nuestra propia empresa sino de las relaciones que mantiene con aquellas otras con las que realiza transacciones. Si se aprovechan adecuadamente estas interrelaciones pueden verse beneficiados tanto la empresa como los proveedores y/o los clientes, de tal forma que el resultado favorezca a todos los integrantes de la cadena de valor simultáneamente. **Lugar de estudio.** La investigación se realizó en el municipio de Ensenada, Baja California, específicamente en El Valle de San Quintín, que se encuentra ubicado a 123 Kilómetros al sur de Ensenada y a 300 kilómetros de la frontera con Estados Unidos de Norteamérica. El clima predominante de la región es seco, incluyendo diversos microclimas. En San Quintín se encuentra uno de los valles agrícolas más importantes de Baja California, cuenta con 14 grandes empresas agrícolas con más de 20 mil hectáreas de riego, con tecnología de punta que les permite aprovechar el agua al máximo, ya que en esta zona este vital líquido es escaso; cuenta también con modernos procesos productivos, semillas mejoradas mediante biotecnología, manejo fitosanitario, fertirrigación, invernaderos computarizados, y empacadoras que garantizan la calidad y presentación de sus productos para exportación. El clima que posee de tipo mediterráneo, es ideal para cosechar frutas y verduras casi todo el año, entre su principal cultivo se encuentran las hortalizas, principalmente tomate, fresa, col de Bruselas, chile, calabacita, pepino y papa (INEGI, 2010).

Características de la Col de Bruselas

La col de Bruselas, también llamadas repollos de Bruselas (del Grupo Gemmifera de Brassica oleracea; su nombre científico es *Brassica oleracea var. gemmifera*). La col de Bruselas pertenece a la gran familia de las Crucíferas, en la que aparecen registrados más de 300 géneros y unas 3,000 especies propias de regiones

templadas o frías del hemisferio norte. El término Brassica, género al que pertenecen, es el nombre latino de las coles. Dentro de dicha familia se encuentran otras muchas variedades: brócoli, col blanca o repollo, col lombarda, coliflor, nabo, rábano, etc. En nuestro país, el cultivo comercial de la col de Bruselas es relativamente reciente, con una presencia en el mercado internacional a partir de los años ochenta, ubicándose dentro de los llamados productos comercialmente no tradicionales (Romero, 2004), participando en el mercado con bajos volúmenes, pero con un importante nicho de consumidores.

Estas verduras son preferidas por los consumidores, por su alto contenido de propiedades nutritivas, son las que más calorías aportan de su género, a expensas de su mayor contenido en hidratos de carbono y proteínas (de bajo valor biológico). Comparten con el resto de verduras su elevada proporción de agua. Constituyen la mayor fuente de vitamina C respecto de las verduras de su misma familia. Son una fuente interesante de folatos, y, en menor proporción, de beta-caroteno y vitaminas del grupo B (B1, B2, B3 y B6). Entre los minerales destaca la presencia de potasio, fósforo y yodo, así como cantidades discretas de zinc, calcio (de pobre absorción), magnesio y sodio (Jaramillo y Díaz, 2006). El contenido de fibra insoluble es elevado, lo que favorece la sensación de saciedad y el tránsito intestinal, con lo que mejora el estreñimiento. Las coles son ricas en ácido cítrico, que potencia la acción beneficiosa de la vitamina C. Los folatos intervienen en la producción de glóbulos rojos y blancos, en la síntesis de material genético y en la formación de anticuerpos del sistema inmunológico. La vitamina C es reconocida por su acción antioxidante, colabora en la formación de colágeno, huesos, dientes y glóbulos rojos, además de favorecer la resistencia a las infecciones y la absorción de ciertos nutrientes de los alimentos (hierro, ácido fólico y ciertos aminoácidos) (Eroski, 2014).

CRITERIOS METODOLÓGICOS

Para realizar el estudio se consideró pertinente utilizar el estudio de caso, que va a contribuir a ampliar y profundizar los conocimientos con respecto a las actividades realizadas por organizaciones e individuos, y sus fenómenos relacionados. Para la cuantificación de los datos sobre los productores de la col de Bruselas, se seleccionaron a 4 de los 6 productores de esta hortaliza en el Valle de San Quintín, Baja California, a los cuales se les aplicaron cuestionarios como métodos de obtención de datos, utilizando la técnica de análisis de la encuesta. Para ello también se consideró información directa de productores, cosechadores y comercializadores, por medio de la entrevista, es decir, de quienes han estado en contacto directo con la producción de esta hortaliza; se utilizó también la observación (Fritzen, 2007), con 2 de los productores, con la finalidad de recabar información de una manera personal, sobre el área de trabajo y entorno donde se desarrolla la producción. La unidad de medida con la que se comercializa al mercado de exportación la col de Bruselas en el Valle de San Quintín, Baja California, es la libra. En cuanto a la comercialización, se seleccionó a 4 productores, seleccionados por intención, para definir las actividades de producción, se identificaron aspectos de inversión del productor, así como la razón de sembrar esta hortaliza. Se consideró información sobre sus costos de producción, comportamiento en los precios de venta de la col de Bruselas, tipo y presentación del producto, así como su transporte desde el lugar de producción al empaque y mercado de consumo (Caldentey, 1979; García et al., 1990), ya que forman parte importante dentro de la cadena de valor de esta actividad agrícola.

RESULTADOS

La región de San Quintín, Baja California, es una zona en la que se obtiene mayor producción de la col de Bruselas dentro del Estado de Baja California, además de que cada vez se encuentran mayores empresas en el Valle de San Quintín, Baja California, cultivando esta hortaliza. Por lo tanto sobre los resultados de la investigación se encuentra que un 100% de la muestra analizada, en el Valle de San Quintín, Baja California, su mercado es de exportación hacia Estados Unidos de América, principalmente en el Estado de California. Situación que es provocada por que el Valle de San Quintín, Baja California tiene una cercanía a la frontera con Estados Unidos de Norteamérica, su clima y periodos de invierno, similares, hacen que esta región tenga una ventaja competitiva incomparable con respecto a otras del país que produzcan esta

hortaliza. Este mercado de exportación hacia Estados Unidos de Norteamérica, es llevado a cabo por medio de empresas comercializadoras, también llamadas comúnmente por los productores “Distribuidoras”, ocupando un lugar muy importante en la cadena de valor de las empresas del Valle de San Quintín: La distribución del producto. Estas empresas distribuidoras o comercializadoras Norteamericanas, realizan transacciones de compra-venta en volúmenes elevados.

Trabajan por su cuenta, tienen espacio para almacenar, refrigerar, re empacar y madurar en cuartos gasificados y con temperaturas controladas, el gran volumen y la variedad de productos que reciben; además otorgan crédito a sus clientes. Las empresas cuentan con transporte refrigerado para abastecer de producto en los puntos de embarque y surtir los pedidos de sus clientes, que bien pueden ser otros mayoristas o minoristas en la misma ciudad o en ciudades cercanas. Distribuyen sus productos mediante cargas de camiones, ventas al mayoreo, medio mayoreo, por tarimas o pallets. Es decir envían a sus clientes el volumen, variedad, calidad y precio de los productos que se les soliciten Después de haber realizado la investigación correspondiente del caso, se confirma que: La razón por la que el eslabón de Distribución dentro de la cadena de valor, se cumple por medio de exportaciones hacia la Unión Americana de los productores de col de Bruselas en el Valle de San Quintín, Baja California, reduciendo costos y a la vez pudiendo obtener mayores rendimientos puestos que los canales de comercialización son muy reducidos, lo cual se debe principalmente a los siguientes aspectos:

La col de Bruselas es producto comercialmente no tradicional, considerado por los productores como un “mercado especial” o de “gourmet”, ya que se vende en volúmenes reducidos a un mercado muy particular que se caracteriza sobre todo por ser población de origen Italiano, de edad avanzada (Mercado Segmentado). La venta de la col de Bruselas se hace a través de diversas presentaciones, como son la caja de 25 libras, de 12 libras y de una libra, entre otras. Lo que nos indica que los productores de la col de Bruselas, cuentan con una infraestructura de empaque, un manejo post-cosecha, y esto a su vez le da un valor agregado al producto, al ofrecer varias presentaciones. La relación comercial con las comercializadoras Americanas, además de mantener tratos comerciales por varios años, también se comercializan otros tipos de hortalizas, como tomate, apio, cebollines, fresas, pepinos, chicharos, etc. La venta del producto puede ser con la marca o etiqueta del productor o bien con las marcas o etiquetas de las empresas comercializadoras, siempre que lleve toda la información del origen del producto. Existe un reducido número de productores de coles de Bruselas en el Valle de San Quintín, Baja California.

CONCLUSIONES

La col de Bruselas es un producto comercialmente no tradicional, con un número reducido de productores. Es un producto especial para un nicho de mercado ya establecido (segmentación de mercado), una comercialización con una reducida cadena de participantes que ha hecho que la cadena de valor en la producción de este producto tenga importantes ventajas competitivas, específicamente para el mercado de exportación, debido a la importante participación de las empresas distribuidoras Norteamericanas, ocupando en su totalidad el eslabón de distribución dentro de la cadena de valor de las empresas productoras de col de Bruselas en el Valle de San Quintín, Baja California.

El atractivo de sembrar la col de Bruselas en el Valle de San Quintín, Baja California, estriba para algunas empresas en la posibilidad de seguir produciendo y generando flujos de efectivo para su empresa en épocas de invierno, es decir como cultivo alterno, ya que para otros productores pequeños, lo consideran como cultivo primordial, porque suele ser un cultivo barato en producirlo, no requiere de gran calidad de agua para su riego, es decir, es tolerante a sales que comúnmente se encuentran en los mantos acuíferos del Valle de San Quintín, Baja California, tolerante a plagas del suelo, tolerante a climas, (vientos, frío), fácil manejo de cosecha. Aunque para controlar las plagas si requiere de mayor frecuencia de fumigaciones por aire, se está utilizando el manejo integrado de plagas (manual, química, biológica, orgánica, mecánica, cultural, legal, genético, etc), con la finalidad de disminuir la intensidad de aplicaciones. En estos últimos años, el

mercado de la col de Bruselas, está exigiendo producto de una medida de pequeña (small) a mediana, compacta, redonda, color verde alimonado y crujiente. Esta exigencia se tiene que cumplir para poder seguir comercializando esta Brassica oleracea y no perder ese nicho de mercado que de por si no es muy extenso.

En el Valle de San Quintín, Baja California, también se ha estado analizando la posibilidad de producir las coles de Bruselas orgánicas, para tratar de darle un plus o un alto valor agregado al producto. Además de ello se cumpliría con las exigencias de medidas de inocuidad de nuestro principal canal de comercialización (distribuidor en la cadena de valor) que es, América del Norte. La col de Bruselas, es un claro ejemplo del proceso de especialización que se registra tanto en las zonas productoras como en el uso de tecnologías para el cultivo de hortalizas. Con mercados específicos y bien definidos, estos productos muestran un potencial y una importancia regional que deben cuidarse, sobre todo si la aspiración es el desarrollo de un sector agropecuario que ponga cuidado en cada uno de los eslabones de la cadena de valor que lo componen, desde el productivo, pasando por el comercial, hasta el ecológico, factores que hoy en día son necesarios tomar en cuenta para competir en este mundo globalizado y que por lo tanto debería ser una labor compartida por todos.

Limitaciones

A pesar de que la producción de la col de Bruselas es un cultivo que no requiere de gran inversión, ni de una gran calidad de agua para producirla, fácil manejo de cosecha, considerado también como un cultivo redituable; es una hortaliza que pocos agricultores se han animado a producir, se puede considerar que para llegar a conseguir la relación comercial con alguna distribuidora, es lo complicado, ya que son mercados muy segmentados, y que se requiere eliminar esa segmentación para que un mayor número de consumidores prefieran consumir esta hortaliza que tantas ventajas nutritivas y medicinales posee. Este trabajo se requiere llevar a cabo tanto en el extranjero y con una muy fuerte labor en México, ya que por desconocimiento de los consumidores sobre las propiedades que posee esta crucífera es que gran parte de la población mexicana no la consume. Otro aspecto que se debiera considerar sobre la comercialización de la col de Bruselas en México, tanto para exportación como para mercado nacional, es la posibilidad de crear Distribuidoras Mexicanas, que funcionen como centros de acopio, donde se gestionen y protejan las negociaciones y comercialización de este producto, se necesita un equipo para satisfacer las necesidades de los clientes, que trabajen directamente con las oficinas de compra de los clientes, que entreguen calidades superiores del producto, que se involucren en todos los aspectos de las relaciones comerciales, se desarrollen programas de inocuidad, programas de responsabilidad social para poder realizar un trabajo excelente y competitivo que cumpla con las exigencias de los mercados Internacionales. Esto provocaría el poder extender los canales de comercialización y no limitarlos a un solo canal como es hacia Estados Unidos de Norteamérica. ¿Por qué no pensar en Comercializar la col de Bruselas directamente a Canadá, Japón, China y Europa?

RESUMEN

El agroturismo es un tipo de turismo rural que se realiza dentro de las instalaciones de ranchos agrícolas, combinando la vida productiva del rancho agropecuario con la recreación tradicional y participación directa o indirecta del turista con el estilo de vida rural y sus tradiciones agrícolas. Con el propósito de obtener una primera aproximación al conocimiento de la factibilidad para la realización de proyectos agro-turísticos en valles agrícolas mexicanos fue realizada esta investigación, teniendo como referencia la región noroeste de México (Baja California y Sonora). Para lograr el objetivo de este trabajo de investigación fue obtenida información de expertos en turismo y propietarios de ranchos agrícolas, entrevistados de manera informal. Los resultados muestran que existen grandes oportunidades para el aprovechamiento de ranchos agrícolas en actividades turísticas, debido al amplio periodo que se puede prestar con este tipo de servicios (todo el año) y al gran flujo de turistas nacionales y extranjeros que de manera muy frecuente pasan por los ranchos sin visitarlos. Tanto Sonora como Baja California poseen fuertes atractivos agrícolas y muchos ranchos crían ganado cuya ordeña y producción de quesos puede representar fuertes atractivos turísticos adicionales. Entre otras potencialidades se encuentran la posibilidad de mejorar el nivel de vida de los agricultores participantes en agroturismo y representa una necesidad para el desarrollo regional. También se discuten limitaciones en cuanto a la falta de infraestructura comercial y de servicios y sobre todo la falta capacitación gastronómica y de servicios en cada uno de los ranchos agrícolas. Sin embargo, todo lo anterior hace posible concluir que existen elementos suficientes que respaldan el gran potencial para la realización de proyectos de turismo agrícola en la región del noroeste mexicano.

PALABRAS CLAVE: Agroturismo, Noroeste de México, Potencialidades, Limitaciones

ANALYSIS OF POTENTIALITIES AND CONSTRAINTS FOR DEVELOPMENT OF AGRITOURISM PROJECTS IN THE NORTHWEST OF MEXICO

ABSTRACT

Agritourism is a type of rural tourism that takes place within the facilities of agricultural farms, productive life combining agricultural ranch with traditional recreation and tourist directly or indirectly with the rural lifestyle and agricultural traditions share. In order to obtain a first approach to understanding the feasibility to carry out agritourism in Mexican agricultural valleys was conducted this research with reference to the northwestern region of Mexico (Baja California and Sonora). To achieve the objective of this research was obtained expert information on tourism and agricultural ranches owners interviewed informally. The results show that there are great opportunities for the utilization of agricultural farms in tourism due to the long period that can provide this type of service (all year) and the large flow of foreign and domestic tourists who spend too frequently by ranches without visiting them. Both Sonora and Baja California have strong agricultural attractions and many ranches breed cows whose milking and cheese

production may represent strong additional attraction. Other possibilities include the possibility to improve the standard of living of the farmers involved in agritourism is a need for regional development. Constraints are discussed in terms of the lack of commercial infrastructure and services and especially the lack of gastronomic and services in each of the agricultural training farms. However, all this makes it possible to conclude that there is sufficient evidence to support the great potential for the realization of projects for agricultural tourism in the region in northwest Mexico

INTRODUCCIÓN

Las capacidades que presenta el desarrollo del agroturismo en México y el mundo son enormes, al grado que su implementación en algunos países como Chile, España y Argentina (Constabel, Oyarzún & Szmulewics, 2007), entre muchos otros, ha repercutido de manera significativa en el crecimiento económico de dichos países. Para poder llevar este tipo de logros a zonas semidesérticas del noroeste de México se hace necesario conocer, valorar, conservar y darle un uso sostenible a las regiones en donde se proyecten realizar actividades de agroturismo. Lo anterior podría ofrecer una mejor calidad de vida a poblaciones que originalmente han venido realizando solo actividades agropecuarias en zonas rurales. Entre los beneficios que se pueden obtener con el turismo rural se encuentra la recreación, la valoración del trabajo artesanal, la conservación de los recursos naturales, propiciaría la generación de empleos e ingresos adicionales para las empresas rurales, abriría espacios para la participación de la sociedad e iniciativa privada en la conservación y manejo de los centros de recreación y disminuiría la presión de explotación de los recursos naturales, al diversificar las actividades y fuentes de ingresos (Neri *et al.*, 1999).

REVISIÓN LITERARIA

García (2005) define al turismo rural como una alternativa de adaptación a los cambios en las necesidades de los consumidores. Constabel y colaboradores (2007) clasifican al turismo rural en ecoturismo, turismo de aventura, turismo cultural y agroturismo. Es por ello que al agroturismo se le ubica como una modalidad del turismo en espacios rurales, asociada a la participación y/o observación activa del turista en las actividades agropecuarias y/o prestación de servicios de alojamiento, diversión, aprendizaje, gastronomía y comercialización (de productos frescos y/o procesados), dentro de la misma propiedad agrícola (Morales *et al.*, 2014). Barrera (1998), por ejemplo, define al agroturismo como un tipo de turismo que se lleva a cabo en explotaciones agropecuarias, combinando recreación tradicional y contacto con la vida del predio, conociendo el modo de vida rural y las tradiciones agrícolas. Las principales actividades productivas que sustentan el agroturismo son aquellas propias de las explotaciones rurales como: cosecha, ordeña, rodeo, trilla, elaboración de conservas, asistencia en la alimentación y cuidado de los animales entre otros, aunque “a veces estas sólo tengan una finalidad demostrativa y no productiva.

Para los propósitos del presente trabajo, se define a las potencialidades como todas aquellas oportunidades medibles para hacer o diversificar un negocio en materia de turismo, aprovechando los atractivos del campo, el paisaje agrícola, los procesos productivos y la degustación de sus muy variados productos. La magnitud que se encuentre en el potencial de cada actividad o la cantidad de actividades que se puedan adicionar al servicio o negocio original es lo que marcará la diferencia entre los ranchos o regiones agrícolas. Por limitaciones, en cambio, se consideran los aspectos que quedan fuera del control y de la cobertura del agroturismo con el fin de precisar su viabilidad, así como las fronteras hasta donde pueden llegar las aspiraciones de esta investigación.

METODOLOGÍA

El propósito de este trabajo consistió en obtener una primera aproximación al conocimiento de la factibilidad para la realización de proyectos agro-turísticos en valles agrícolas del noroeste de México (Baja California y Sonora). Para lograr tal fin, fue utilizada la técnica tipo “*focus group*” o Grupo focal, considerada como una técnica cualitativa de estudio de opiniones. Con el uso de ésta técnica se discutió la posibilidad de manejar de manera integral las actividades agropecuarias y turísticas que condujeran a aprovechar de manera más eficiente las actividades en los ranchos agrícolas, pero considerando las limitaciones identificadas. Para lograr el objetivo mencionado también fue obtenida información de muy variados artículos y libros publicados sobre el tema, pero muy particularmente de expertos en turismo y propietarios de ranchos agrícolas, entrevistados de manera informal. Las potencialidades del agroturismo en ambas entidades federativas (Sonora y Baja California) se pudieron reconocer bajo la consideración de lo que se tiene en cuanto a recursos: humanos, naturales, económicos, conocimientos, infraestructura y culturales, entre otros.

RESULTADOS Y DISCUSIONES.

Diagnóstico Regional

Sonora: Coronado-García y colaboradores (2014) han estado trabajando con la organización de servidores turísticos que organicen cadenas de valor para fomentar el turismo rural en la sierra de Sonora. Ellos afirman que la región serrana del estado de Sonora se ha caracterizado por ser ganadera y en menor grado agrícola. Además de practicar la talabartería, donde la baqueta, como producto del aprovechamiento de la piel del ganado vacuno es uno de sus principales productos, la venta de carne y la producción de leche y quesos, como atractivos agroturísticos, son actividades comunes en los ranchos de esa región serrana de Sonora. Sin embargo, Coronado et al (2014) afirman que al no diversificar sus actividades productivas, dentro del marco económico regional, las actividades de negocios en los ranchos corren un alto riesgo a desaparecer. En otra región de Sonora, cercana al municipio de Santa Ana, Villegas y colaboradores (2014) se dieron a la tarea de identificar áreas susceptibles para el aprovechamiento del turismo rural en suelos ejidales. Estos autores encontraron 6 lugares que pueden ser aprovechables para llevar a cabo el turismo rural en donde pueden realizarse actividades ecoturísticas como la observación de roedores, aves, reptiles y arácnidos, mientras que la vegetación, representada por dos especies dominantes de composición florística, está dominada por *governadora* y la *ambrosia*. También existen zonas arqueológicas y pinturas rupestres que se pueden situar, como turismo cultural, entre los mayores atractivos para turistas internacionales.

Morales et al (2014b), al hacer un diagnóstico muy superficial de ciertos atractivos agroturísticos en Sonora, plantearon la necesidad de realizar estudios de costo-beneficio, enfatizando la necesidad de promover al agroturismo en zonas rurales con la estrategia competitiva de bajos costos, con el fin de que sea una actividad turística competitiva y atractiva por su originalidad de servicios, con respecto a la ofertada en zonas urbanas. Entre los atractivos agroturísticos adicionales potenciales por desarrollar en Sonora, que estos autores complementan, se encuentran las rutas de cultivos de la Vid (rutas del vino), las rutas por los abundantes cultivos de naranja y los atractivos cultivos de árboles de nogal en las zonas costeras y todas las actividades relacionadas con empresas acuaculturales, así como los atractivos culturales de las Misiones y de pesca deportiva en las extensas costas sonorenses, entre muchos otros por descubrir.

Baja California: Como un ejemplo de las potencialidades que representa el agroturismo en Baja California se describen a continuación los atractivos turísticos con los que cuenta la ruta agrícola del Valle de San Quintín. Solo en este valle rural agrícola se cuenta con 26 hoteles distribuidos desde Punta Colonet hasta El Rosario. En éste mismo segmento también se tienen reportados 21 restaurantes, cuatro de ellos con especialidad en mariscos. Se tienen identificadas áreas para realizar actividades acuáticas como surf, entre otros.

windsurfing y buceo autónomo. Como actividad recreativa familiar se cuenta también con 3 balnearios y casi 10 ranchos y áreas acondicionadas para casas rodantes (RV Park). Se tiene una gran variedad de atractivos turísticos rurales, entre los que se encuentran:

Históricos (*3 ruinas de misiones, 3 museos, 1 zona de restos fósiles*),
Ecológicos (*parque nacional de San Pedro Mártir, avistamiento de ballenas, gansos, Borrego cimarrón y lobos marinos*)

Deportivos (*pesca, buceo, surf, wind surf, Kayaking, kite surf, etc.*)
Recreativos (*3 balnearios*).

Gastronómicos (*4 restaurantes de mariscos y zona de cultivo y consumo de ostiones*).

La agricultura ha sido por generaciones (desde mediados de 1880) la actividad por excelencia desarrollada en éste Valle. No ha sido hasta hace unos años atrás que se ha iniciado a ver al turismo como una oportunidad de diversificar las actividades tradicionales, haciendo que se vayan integrando poco a poco las actividades turísticas a las agropecuarias en esta región (Morales et al., 2014a).

Potencialidades

Aprovechar los recursos antes señalados en ambas entidades federativas representa una gran potencialidad de desarrollo regional. Ambas entidades se caracterizan por tener una amplia riqueza turística y un amplio periodo potencial para ofertar sus servicios agro-turísticos (todo el año) en zonas rurales; en Baja California los atractivos se encuentran en el paso obligado por tierra de turistas nacionales y extranjeros; en ambas entidades federativas se cuenta con una amplia experiencia en competencias agropecuarias ya adquiridas y bajo estas fundamentales potencialidades, es posible afirmar que el agroturismo representa una estrategia factible para apoyar el desarrollo regional. En ambas regiones es posible disfrutar del paisaje agropecuario, recolección de hortalizas y de pitayas, vivir la ordeña y crianza de ganado bovino, y caprino, la elaboración de sus quesos, paseos a caballo, elaboración de embutidos, pasteles y payes de frutillas, bebidas naturales de frutillas frescas y fermentadas, excursiones y recorridos por caminos y senderos, ascensos de montaña, campismo y aprendizaje en la elaboración de productos comestibles de corte artesanal, cosecha de nueces, naranjas, uvas, entre muchas otras actividades.

Desarrollar el potencial pesquero y acuacultural, tanto deportivo como productivo y comercial, también es de muy relevante consideración. Mejorar los ingresos de empresas agropecuarias participantes en actividades turísticas es una oportunidad fundamental dentro del marco del desarrollo económico. Vender y posicionar los productos agropecuarios de los ranchos es para cualquiera muy atractivo, sobre todo si el sector académico y gubernamental le ofrece su apoyo a las empresas agrícolas que les interese incursionar en el turismo. Con un poco más de visión, ambas regiones, con el desarrollo de sus actividades agroturísticas, podrían mejorar sus relaciones comerciales de la empresa con mercados nacional e internacional. Para el logro de éstos fines, el trabajo colaborativo ha resultado ser muy buena opción, tanto para proyectos productivos, gubernamentales como en la misma educación. Boavida & Da Ponte (2011) comentan que la colaboración no es un fin en sí mismo, pero sí un medio muy efectivo para alcanzar ciertos objetivos. Por eso, objetivos diferentes, perseguidos en condiciones diversas, exigen, naturalmente, formas de colaboración también muy diversas.

Lilianseg (2010), en un estudio de agroturismo realizado en Purranque, Chile, afirma que existen dos características del turismo en el espacios rurales: “La primera tiene relación con el potencial turístico del medio rural, asociado a que éste no exige que la región tenga atractivos naturales extraordinarios, sino que posea aspectos culturales bien desarrollados, una arquitectura apreciable, una gastronomía característica, que la población conserve sus hábitos y costumbres, tornando la zona interesante, como un todo. La

segunda, tiene que ver con la posibilidad de crear vínculos con otras actividades tales como la elaboración de alimentos caseros (panes, pasteles, quesos, cecinas, conservas, mermeladas, dulces, miel, etc.), los restaurantes de comidas típicas, la artesanía, los paseos (de carreta y/ o a caballo) y los senderos para caminatas ecológicas, entre otros”. El servicio de alojamiento en el turismo rural también representa una potencialidad de desarrollo; el alojamiento debe cumplir con ideas que se vendan: Seguridad, limpieza, sencillez, comodidad, atención, placer y tranquilidad, entre otras. Atractivos que sorprendan al turista y lo conduzcan a gozar, descansar, leer, pasear, sentir (degustar, mirar, oler, escuchar, tocar), admirar, imaginar, soñar, seducir, conversar, pensar, disfrutar, revivir, etc. (García, 2005).

Limitaciones: Éstas son de muchos tipos, pero destaca una falta de infraestructura comercial y de servicios, sobre todo en materia de capacitación gastronómica. La “identidad rural” es insuficiente, lo que dificultaría definir la misión agroturística por los ranchos en ambas regiones. De fundamental relevancia es la organización y comunicación entre actores y éstas son características ausentes, generalizadas entre ranchos o empresas que inician en los dos Estados. A este respecto, si las organizaciones se caracterizan por ser individualistas y jerárquicas, se hace extremadamente difícil realizar un proyecto colectivo. Es por ello que la estrategia de trabajo colaborativo en este tipo de proyectos es fundamental y muy prometedora (Boavida & Da Ponte, 2011).

CONCLUSIONES

De manera concluyente es posible afirmar que existen elementos suficientes que respaldan el gran potencial para la realización de proyectos de turismo agrícola en la región del noroeste mexicano. Para ello es necesario iniciar por acondicionar la infraestructura requerida en actividades comerciales para vender y posicionar los productos gastronómicos elaborados. Promover la diversificación de actividades productivas con el desarrollo agroturístico en la región no se puede lograr con el simple aprovechamiento de sus recursos. Dicho potencial solo se puede lograr con el desarrollo de capacidades (conocimientos, habilidades y actitudes) y con la participación activa de la comunidad en movilizar la mayor cantidad del potencial, orientado a satisfacer las necesidades o deseos de un mercado insatisfecho de turistas en éstas regiones agrícolas. Se recomienda adicionalmente capacitar en el idioma Inglés a las personas que participen en el agronegocio para mejorar las relaciones comerciales internacionales de la empresa.

CONTRASTE DE OPINIONES EMPRESARIO-CLIENTE, EVALUANDO LA COMPETITIVIDAD DE COMERCIOS EN EL VALLE DE SAN QUINTÍN, B.C.

Fanny Yumayra Reyes Aceves, UABC-FINSQ
Lizzette Velasco Aulcy, UABC-FINSQ
Luis Alberto Morales Zamorano, UABC-FINSQ

RESUMEN

Álvarez (1997, citado por Chaves, 2004) define la competitividad cómo la capacidad que tiene una empresa para dominar su mercado (mayor participación) obtener utilidades y satisfacer a sus clientes. Este estudio está realizado en la región de San Quintín, un valle que actualmente está en crecimiento, desafortunadamente sus comercios han mostrado no estar preparados para tal despunte en la región. La investigación está centrada en los comercios del tipo supermercados ya que son los que actualmente han enfrentado competencia de nivel nacional. Como parte de un proyecto de investigación, se recabó información cuantitativa mediante la realización de cuestionarios tanto a los dueños como a los clientes de los supermercados en la región. El objetivo principal era conocer formalmente la opinión de ambas partes, con ambos puntos de vista se logró realizar un contraste de opiniones, identificando principalmente en que puntos coinciden y en que puntos difieren en cuanto a los servicios que el empresario dice ofrecer y los servicios que el cliente realmente recibe. Entre los hallazgos más importantes se encontró que los dueños no han pensado en la gravedad del problema, no están preparados para competir, no han proyectado sus comercios en un largo plazo, no tienen información de orientación al mercado y se pudo notar que los clientes tienen inconformidades que los dueños aún desconocen.

PALABRAS CLAVE: Supermercados, Competitividad y MIPYMES

CONTRAST OF EMPLOYER-CLIENT REVIEWS, ASSESSING THE COMPETITIVENESS OF BUSINESSES IN THE VALLEY OF SAN QUINTÍN, B.C.

ABSTRACT

Álvarez (1997, cited by Chaves, 2004) defines competitiveness as the ability of a company to dominate your market (greater market share) make profits and satisfy their customers. This study was conducted in the San Quintin valley which is currently growing, their businesses have shown unfortunately not prepared for such emergence in the region. The research is focused on the supermarket type shops as they are the ones who have actually faced competition nationally. As part of a research project, quantitative data was collected by conducting questionnaires to both owners and customers of supermarkets in the region. The main objective was to formally hear the views of both parties, both views was managed to perform a variety of opinions and identifying mainly to points coincide and at what points they differ in terms of services which the employer says it offers and services that the customer actually receives. Among the most important findings was found that the owners of supermarkets have not thought about the seriousness of the problem, are not prepared to compete have not projected their businesses in the long term, they have no information of market orientation and it was noted that customers have complaints that the owners still unknown.

KEYWORDS: Supermarkets, competitiveness and MSMEs

INTRODUCCIÓN

López, Segobia y Beade (2013) abordan la forma en que los supermercados llegaron al mundo y a nuestro país. Estos autores explican que antes de los supermercados era necesario ir a distintos comercios para poder adquirir todos los productos del hogar diariamente, lo que era un recorrido al cual las mujeres de la casa debían invertir mucho tiempo. Según la investigación de estos autores el primer supermercado en México abrió sus puertas en 1958 (30 años después de iniciado este tipo de negocios en EE. UU.). A finales de los 80 y principio de los 90 fue cuando los supermercados se expandieron y se consolidaron como los vemos hasta hoy.

San Quintín al estar alejado de las ciudades se tardó un poco más en desarrollar estos sistemas para hacer las compras, sin embargo, en los 90 ya se contaba con supermercados propiedad de empresarios empíricos de la región. Este estudio se realizó porque se detectó que en la comunidad existían pocos comercios que cumplieran con las expectativas de los clientes. El hecho de que no existieran muchas opciones a elegir por los clientes, los obligaba a consumir en los negocios existentes. Actualmente se están estableciendo nuevos comercios que ofrecen mejores servicios, además de que tienen mayor oferta de productos y los comerciantes antiguos están comenzando a sentir la necesidad realizar mejoras en sus negocios para lograr la fidelidad de sus clientes. Analizando un poco lo que ha pasado en otras regiones con los comercios locales cuando las empresas grandes llegan a establecer sus supermercados, se pensó en la necesidad de conocer cuales son los puntos de vista de los clientes y de los empresarios en cuanto al servicio recibido y brindado respectivamente.

En esta trabajo se muestra un poco de aportaciones teóricas respecto a las micro, pequeñas y medianas empresas, el concepto de supermercado (ya que estos son los comercios objetivo), se muestra también una definición de competitividad y de ventaja competitiva. Posteriormente se hace un recuento de los pasos que se siguieron para poder llevar a cabo la investigación, después se presentan los resultados más relevantes y en la sección final se concluye cuales fueron los hallazgos encontrados más importantes. El objetivo de esta parte de la investigación es mostrar las diferencias o similitudes de opiniones entre clientes y empresarios respecto a los productos y servicios que ofrecen los supermercados de la región.

REVISIÓN DE LITERATURA

La Small Business Administration (SBA), citado por (Guillen & Pomar, 2005, p. 13) define a la pequeña empresa (PE) como “aquella que posee el dueño en plena libertad, manejada autónomamente y que no es dominante en la rama que opera”. Hay distintas maneras de clasificar a las empresas para determinar cuál es su tamaño, normalmente se clasifican en base al número de empleados, según el Diario Oficial de la Federación (DOF) del día 18 de enero de 2012, se clasifican de la siguiente manera:

Tabla 1: Clasificación de las empresas

Sector/Tamaño	Estratificación Por Número de Trabajadores		
	Industria	Comercio	Servicios
Micro	0-10	0-10	0-10
Pequeña	11-50	11-30	11-50
Mediana	51-250	31-100	51-100

Fuente: Diario oficial de la federación, 2012.

Una de las formas más sencillas y cualitativa de clasificar a las pequeñas empresas es la del Comité Bolton de Gran Bretaña en Suárez, (2003, citado por Martínez, 2012) que se basa en los siguientes puntos:

En términos económicos posee una parte relativamente pequeña de su mercado.

En términos de control de la propiedad está dirigida por sus propietarios de una manera personalizada, tendiente a la no mediación de profesionales.

En términos de su independencia en el sentido de no formar parte de un consorcio, de manera que los propietarios son completamente responsables de su desarrollo.

Zeballos (2003) resalta la importancia de las micro, pequeñas y medianas empresas (MIPYMES) como generadoras de empleo y promotoras de avances en la economía de un país. Las MIPYMES tienen gran relevancia pues aportan el mayor número de unidades económicas y personal ocupado (pro México, 2013). De esta información surge la necesidad de fortalecer su desempeño, al coincidir que de manera global son fundamentales para las economías nacionales (INEGI, 2009). Las MIPYMES, son prácticamente la columna vertebral de la economía mexicana tanto por los acuerdos comerciales que ha tenido el país actualmente como por su gran impacto en la generación de empleos y en la producción de la nación (pro México, 2013). Según datos del Instituto Nacional de Estadística y Geografía (INEGI, 2010), en el país existen alrededor de 4 millones 15 mil unidades empresariales, de esta cantidad el 99.8% son pequeñas y medianas empresas y generan el 52% del Producto Interno Bruto (PIB) y 72% del empleo nacional. Sin embargo, las MIPYMES no son ajenas a las amenazas del entorno que en determinado momento pueden limitar su desempeño (Benacek, 1995).

Un supermercado es aquel establecimiento que tiene como principal finalidad acercar a los consumidores una importante variedad de productos de diversas marcas, precios y estilos. A diferencia de lo que sucede con gran parte de los negocios, un supermercado se caracteriza por exponer estos productos al alcance de los consumidores, quienes recurren al sistema de autoservicio y abonan la cantidad de productos elegidos al final en la zona de cajas (ABC, 2013). López et al., (2013) explican que generalmente los supermercados tienen una extensión desde los 500 hasta los 4,500m². Ofrecen principalmente productos de abarrotes y perecederos (refrescos, botanas, cigarros, lácteos, cerveza, abarrotes, congelados, productos de limpieza, vinos y licores, entre otros). Y generalmente los servicios que ofrecen son farmacia, fotografía, revelado fotográfico y algún otro. Competitividad es la capacidad para colocar productos en un mercado, con oportunidad, al mejor precio, con calidad y con el mejor diseño, para ganar la preferencia de los consumidores (Carcoba, 1991, citado por Chávez, 2004).

Por su parte Porter (2006) asegura que una empresa tiene ventajas competitivas sobre la competencia cuando su rentabilidad está por encima de la rentabilidad media de las actividades según el sector en el que se encuentra. Para que realmente sea efectiva debe ser difícil de imitar, única, posible de mantener, superior a la competencia y que se pueda utilizar ante los distintos cambios que pueden suscitarse en el entorno. También Hill & Jones (2005) están de acuerdo que sostener una ventaja competitiva es cuando una organización tiene una rentabilidad superior a la

del promedio de todas las empresas del giro industrial al que pertenecen y que esta ventaja competitiva es sostenible cuando se es capaz de mantenerse superior al promedio al rendimiento durante varios años.

METODOLOGÍA

Esta investigación se realizó en el Valle de San Quintín. Este lugar se encuentra en el Estado de Baja California. San Quintín está localizado dentro del área del municipio de Ensenada, a 78 km del sur de la cabecera Municipal. En la región predominan algunas de las actividades primarias como lo es la agricultura, ganadería y acuicultura. Sin embargo, en el Valle de San Quintín existen muchos tipos de negocios del área

comercial. Ésta investigación se centra en los supermercados que están ubicados desde el Poblado de Camalú hasta la Colonia Lázaro Cárdenas, quedando estos dentro del Valle de San Quintín.

Las empresas que fueron consideradas cubren tres características primordiales, la primera es que todas son denominadas supermercados es decir: Aquel establecimiento que tiene como principal finalidad acercar a los consumidores una importante variedad de productos de diversas marcas, precios y estilos. A diferencia de lo que sucede con gran parte de los negocios, un supermercado se caracteriza por exponer estos productos al alcance de los consumidores, quienes recurren al sistema de autoservicio y abonan la cantidad de productos elegidos al final en la zona de cajas (ABC, 2013). La segunda característica para seleccionar la muestra fue su giro o actividad, todos los seleccionados se dedican a: La comercialización y venta de todo tipo de productos alimenticios, así como productos de perfumería, ropa y enseres para el hogar.” La última característica es que debían tener al menos 3 empleados.

Según lo explicado por Hernández, Fernández y Baptista (2006) la investigación se llevó a cabo con un diseño no experimental transeccional ya que los datos utilizados fueron recolectados en un tiempo único. El instrumento de investigación utilizado fue el cuestionario. Se diseñó un cuestionario para empresarios y un formato distinto para clientes. El cuestionario de empresarios consta de 52 preguntas cerradas y el de clientes consta de 47, en ambos instrumentos se utilizó una escala tipo Likert para poder medir las respuestas de los encuestados. Esta escala consiste en cinco opciones de respuesta a elegir las cuales están ponderadas de manera que se logre medir el indicador (Méndez & Peña, 2007). La información recabada se introdujo en una base de datos en el Statistical Package for the Social Sciences (SPSS). Con la ayuda de este programa se realizaron diferentes cálculos estadísticos que ayudaron a codificar dicha información para poder graficar, describir los resultados y también discutirlos e interpretarlos.

RESULTADOS

Se encontró que el 34% de los empresarios dijo realizar demasiadas inversiones en tecnología para mantener frescos los productos. Cuando sólo el 10% de los clientes asegura que los productos están frescos en el mercado de su preferencia. El 46% de clientes contestó que está frecuentemente satisfecho con los productos y servicios al momento de realizar compras. Lo que nos dice que por una parte los empresarios consideran que invierten mucho en tecnología para que el producto este presentable y los clientes consideran que los productos que compran no están en excelentes condiciones. Entre los resultados se observa que el 16% de empresarios mencionó nunca haber realizado cambios en su supermercado por la llegada de algún competidor, mientras que otro 17% también dijo que si lo hace frecuentemente. Por su parte el 72% de los clientes considera que los empresarios si han realizado cambios en sus empresas con la llegada de algunos competidores de la misma forma consideran que esos cambios no son suficientes. Lo más relevante de esta parte es que el 37% de los clientes dicen que los empresarios locales si han realizado cambios y expresaron que debido a esos cambios es que han continuado siendo clientes del antiguo supermercado.

Se observa que el 22% de los empresarios dijeron que nunca imparten platicas de inducción orientadas al servicio de clientes. A los clientes se les preguntó qué tan eficiente es la información que les brindan los empleados cuando tienen alguna duda en los supermercados que frecuentan y el 29% dijo que es normal o regular, lo que significa que no los dejan del todo satisfechos mientras que el 39% dijo que era eficiente y sólo el 10% expresó que era muy eficiente.

Figura 1: Percepción de Empresarios y Clientes Respecto a Inversiones Tecnológicas Para Mantener los Productos Frescos

En estas figuras se muestran los puntos de vista de los empresarios y los clientes respecto a las inversiones tecnológicas para mantener los productos frescos.

Figura 2: Percepción y Clientes Respecto a Cambios Realizados En Supermercados

competidores y por la parte de los clientes la importancia de estos cambios, es decir, si gracias a esos cambios han preferido al comerciante local. En estas figuras se puede observar la frecuencia de cambios realizados por los comerciantes locales después de la llegada de los

Figura 3: Percepción de Empresarios y Clientes Respecto a la Preparación de los Empleados

En estas figuras se puede observar la frecuencia de las platicas de inducción que los empresarios dan a sus clientes y el contraste con la eficiencia de los empleados hacia los clientes.

El 78% de empresarios considera que el ambiente en su supermercado es agradable. EL 50% de los clientes dicen que el ambiente de los supermercados locales es regular, solo el 10% de clientes lo considera muy bueno. Por lo tanto aquí también tenemos una diferencia en las percepciones de ambas partes, los clientes perciben un ambiente no del todo agradable cuando están realizando sus compras.

Figura 4: Percepción de Empresarios y Clientes Respecto al Ambiente Laboral En los Supermercados

agradable que consideran los empresarios su ambiente laboral y como lo perciben los clientes.

Se puede corroborar también que el 67% de los empresarios dijo que considera que sabe mucho sobre los precios que están dispuestos a pagar sus clientes por los productos que consumen. Sin embargo, se sabe que muchos clientes van a los supermercados nuevos porque ahí pueden encontrar productos que en los antiguos no les ofrecen. Esto se puede comprobar cuando a los clientes se les preguntó si ellos consideran que los dueños del supermercado de su confianza conocen los productos que les gusta comprar y sólo el 14% dijo que si saben y tienen siempre todos los productos. EL 46% de clientes dice que casi siempre queda satisfecho con las compras que realiza y un 30% dice que solo a veces está satisfecho con las compras que

realiza.

Figura 5: Percepción de Empresarios y Clientes Respecto a Conocimiento del Cliente Por Parte de los Supermercados

Empresario
¿Qué Tanto Considera Que Sabe Sobre Los Precios Que Están Dispuesto A Pagar Sus Clientes Por Los Productos Que Consumen?

¿Considera Que En Su Mercado Saben Bien Que Productos Son Los Que Usted Compra Con Frecuencia?

En estas

figuras se puede observar que la mayoría de los empresarios consideran que conocen la capacidad económica de sus clientes, asumiendo que los conocen muy bien y como los clientes manifiestan que no los conocen del todo.

Por último, como punto importante se resalta que sólo el 10% de clientes considera que le es 100% fiel a su supermercado.

Figura 6: Percepción de Clientes

Clientes
¿Qué Porcentaje De Fidelidad Considera Que Tiene A Su Mercado Principal?

Esta imagen muestra la fidelidad que los clientes consideran han generado hacia los supermercados locales.

CONCLUSIONES

Algunos empresarios (los que están ubicados relativamente cerca de la reciente competencia) expresaron que notaron cambios solo algunas semanas (que fue el tiempo que duró la novedad) y después todo casi volvió a la normalidad, lo que los tranquilizó. Sin embargo, ellos no se han concientizado en que la región

está creciendo y cada vez tendrán más competencia. Esta nueva competencia vendrá preparada, vendrá con personal capacitado para ganar sus clientes y el hecho de que en la zona no se tenga una cultura orientada al mercado beneficiará a las empresas foráneas, afectando a los empresarios de la comunidad. En el presente trabajo se encontró que algunos de los clientes no tienen idea de los servicios que los supermercados pudieran ofrecer, pues nunca han tenido la experiencia de acudir a supermercados grandes situados en lugares fuera de este valle. Sin embargo, si reflejaron su insatisfacción ante los servicios recibidos.

Los clientes expresaron que si han modificado sus rutinas de compra y ahora generalmente visitan un supermercado local y uno nuevo (competencia nacional) para complementar las compras de artículos básicos en los hogares. Por su parte los empresarios no están capacitados para ofrecer servicios que empresas más grandes ofrecen, no saben que existen opciones que les puedan ayudar a generar ventajas competitivas y que no necesariamente deberán realizar grandes inversiones para obtener buenos resultados. Cuando se contrastaron opiniones se pudo notar que los clientes tienen inconformidades y que los empresarios desconocen el sentir de los clientes. Por su parte, los empresarios sienten que todo está bien. Los empresarios están confiados, en una gran zona de confort en la que con el mínimo o nulo esfuerzo pretenden obtener grandes beneficios, esto no les permite visualizar el futuro competitivo que se aproxima a la región.

CAPITAL HUMANO, CONDICIÓN INDISPENSABLE PARA LA EVALUACIÓN DEL DESEMPEÑO DE LA ADMINISTRACIÓN PÚBLICA MUNICIPAL

Ana Luz Ramos Soto, Universidad Autónoma “Benito Juárez” de Oaxaca
Ramiro Jarquín Martínez, Universidad Autónoma, “Benito Juárez” de Oaxaca

RESUMEN

El presente trabajo de investigación tuvo como objetivo principal: identificar si el capital humano es una condición indispensable para la evaluación del desempeño en la administración pública municipal; para lograr dicho objetivo, se analizó en primera instancia el capital humano de acuerdo modelo de Gratton y Ghoshal, la metodología aplicada fue la aplicación de un cuestionario a las autoridades municipales de Santo Domingo Tomaltepec, Oaxaca, una vez que los datos fueron recabados, éstos fueron procesados en el programa SPSS 19, para llevar el análisis correspondiente para operacionalizar las variables y posteriormente, llevar a cabo un análisis mediante la correlación de Pearson para determinar la relación entre capital humano y el impacto que estos tienen al momento de llevar a cabo la evaluación de la administración pública municipal. Finalmente se aceptó la hipótesis de investigación que cita: Existe una correlación positiva alta entre el capital humano y la evaluación al desempeño en la administración pública municipal; donde los gobernados le dan una calificación de 7.4

PALABRAS CLAVE: Administración, Municipio, Sistema Normativo Interno

HUMAN CAPITAL, AN ESSENTIAL CONDITION TO THE PERFORMACE EVALUATION OF THE MUNICIPAL PUBLIC ADMINISTRATION

ABSTRACT

The present research work had as a main objective, to identify if the human capital is an essential condition to the performance evaluation of the Municipal Public Administration. To get this objective, the human capital was analyzed, in first instance, acoording to the Gratton and Goshal Model. The applied methodology was a questionnaire filled out by the Municipal authorities of Santo Domingo Tomaltepec, Oaxaca. The results were processed in the SSPS 19 Program to opérate the variables, and after that to carry out an analysis throug the Pearson co-relation to determine the relation between the human capital and the impact that they have at the momento of carrying out the evaluation of the Municipal Public Administration. Finally, the research hypothesis was accepted and cites: There is a high positive co-relation between capital human and performance evaluation in the Municipal Public Administration, where the governed people give a score of 7.4

KEY WORDS: Administration, Municipality, Intern Regulatory System

INTRODUCCIÓN

La tendencia en los nuevos modelos de administración pública y la medición del sistema de evaluación al desempeño, encuentra una particular incidencia en la gestión gubernamental cuyo fin único y último es la

prestación de servicios al ciudadano; por lo que la investigación titulada Capital Humano, condición indispensable para la evaluación del desempeño de la Administración Pública Municipal, tiene como objetivo general identificar si el capital humano es una condición indispensable para la evaluación del desempeño en la administración pública municipal; la hipótesis que guio el trabajo de investigación fue que existe una correlación positiva alta entre el capital humano y la evaluación al desempeño en la administración pública municipal, por lo que el trabajo está dividido en cuatro apartados, la primera parte describe el marco teórico terminando con el modelo causal; la segunda parte detalla la metodología de la investigación cuyo diseño fue mixto; se describen los resultados y las conclusiones de la investigación, detallando el logro de los objetivos planteados en la investigación y la respuesta la hipótesis de investigación.

REVISIÓN LITERARIA

Los tres conceptos que están vinculados al capital humano, mismo que se completará con la propuesta integradora de capital humano de (Gratton & Ghoshal, 2003) son: el social, intelectual y el humano. Según Byars & Rue (1996), la Evaluación del Desempeño o Evaluación de resultados es un proceso destinado a determinar y comunicar a los empleados la forma en que están desempeñando su trabajo y, en principio a elaborar planes de mejora. Para Chiavenato (1995), es un sistema de apreciación del desempeño del individuo en el cargo y de su potencial de desarrollo. Este autor plantea la Evaluación del Desempeño como una técnica de dirección imprescindible en la actividad administrativa. Harper & Lynch (1992), plantean que es una técnica o procedimiento que pretende apreciar, de la forma más sistemática y objetiva posible, el rendimiento de los empleados de una organización. Esta evaluación se realiza en base a los objetivos planteados, las responsabilidades asumidas y las características personales. Analizando dichos conceptos, se tiene que la esencia de cualquier sistema de evaluación del desempeño, es realizar una valoración lo más objetiva posible acerca de la actuación y de los resultados obtenidos por la persona en el desempeño de su trabajo diario; poniéndose de manifiesto la óptica de la evaluación, la cual pudiera decirse tiene carácter histórico (hacia atrás) y prospectivo (hacia delante), y que pretende integrar en mayor grado los objetivos organizacionales con los individuales. Dentro de la organización las evaluaciones cubren varios propósitos. Es criterio de autores tales como Harper & Lynch (1992), Chiavenato (1995), Sikula (1989) y Byars (1996) que cuando los sistemas de evaluación del desempeño están bien planteados, coordinados y desarrollados, normalmente trae beneficios a corto, mediano y largo plazo para el individuo, el jefe, la empresa y la sociedad. En el proceso de modernización de los municipios, la planeación debe ser considerada como una condición necesaria, en las dimensiones social, económica y política.

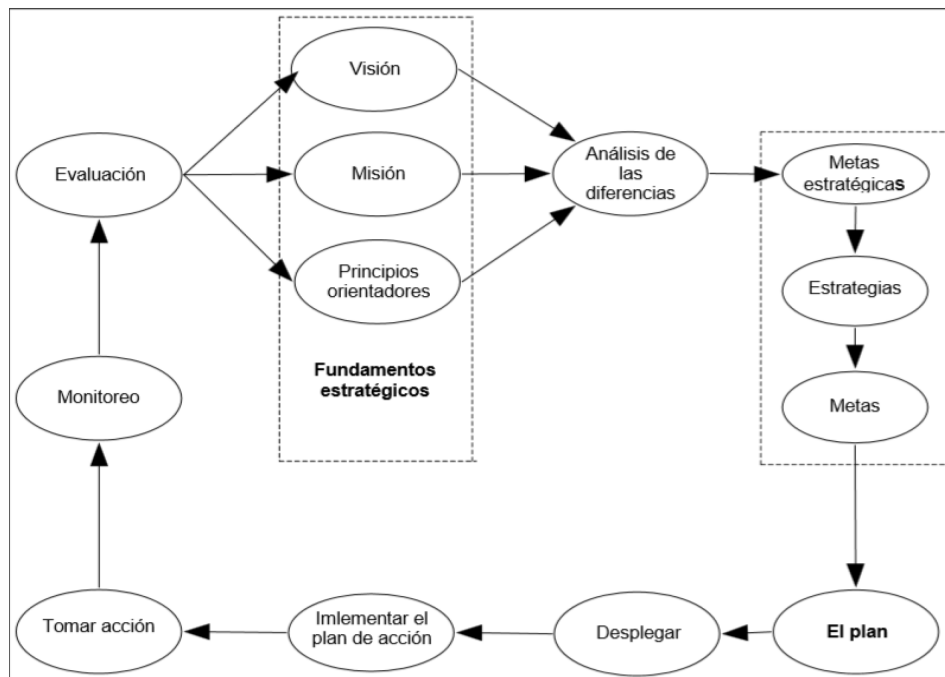

(Montes de Oca Navas, 1996), menciona que la planeación de ahora, debe ser para el mejoramiento de la calidad de vida de la democracia, no una planeación de gabinete, ni cupular. Debe partirse de la base de la pirámide estructural de la sociedad y con la orientación de los planes hacia una política de desarrollo. Se deben hacer los procesos de gestión y rendición de cuentas de manera transparente, de tal manera que se justifiquen los gastos, y que además los propios ciudadanos conozcan con detalle las intenciones, objetivos, programas, procedimientos y los demás elementos de la gestión pública para sancionarlos, orientarlos, sustentarlos y exigirlos. (Merino Mañón, 2001), hace referencia que la rendición de cuentas oportuna, suficiente y competente (accountability) es el instrumento democrático más efectivo para presionar a la gestión pública a optimizar el uso de los recursos (escrutinio) y para obtener la respuesta de los ciudadanos (electores) a sus ofertas políticas y de gestión es, sin duda, un elemento sustancial para la democracia. La planeación estratégica aplicada a los municipios es un instrumento adecuado y debe emplearse para salvaguardar los intereses, sobre todo en zonas tradicionalmente olvidadas de los municipios, con la finalidad de solucionar problemas que le preocupan a la gente y para responsabilizar el aparato administrativo dentro de su gestión.

(Doger Guerrero, 2004), indica que es necesario invertir en las personas, en las comunidades y en el medio ambiente. Dicha inversión debe incluir a toda la gente, buscando construir escenarios futuros acordes a las

necesidades de los ciudadanos. En su libro *Servicios Públicos Municipales* comenta que tener un sistema democrático fortalece la transparencia y que esto ayuda al desarrollo institucional de los municipios. Que los costos de corrupción no son solamente de carácter económico, sino esencialmente éticos y sociales, y se debe buscar una participación ciudadana con la finalidad de detectar oportunamente los problemas del municipio, para que conjuntamente la sociedad y las instancias administrativas den respuesta inmediata, fortaleciendo la gestión municipal utilizando la planeación estratégica con participación social. Los retos actuales y del porvenir exigen a hombres y mujeres construir un nuevo municipio como espacio de convivencia productiva, a partir de la visión dinámica del desarrollo económico-social sustentada en un marco social, económica y política que sea la expresión de una aspiración trascendental de hombres y mujeres del pueblo mexicano (Doger Guerrero, 2004). La planeación estratégica debe tomar en cuenta la Infraestructura Urbana a mediano y largo plazo para ofrecer condiciones de vida adecuada para sus habitantes como son, entre otros, las redes de distribución de agua potable y alcantarillado, alumbrado público, espacios de recreación y elementos de ornato.

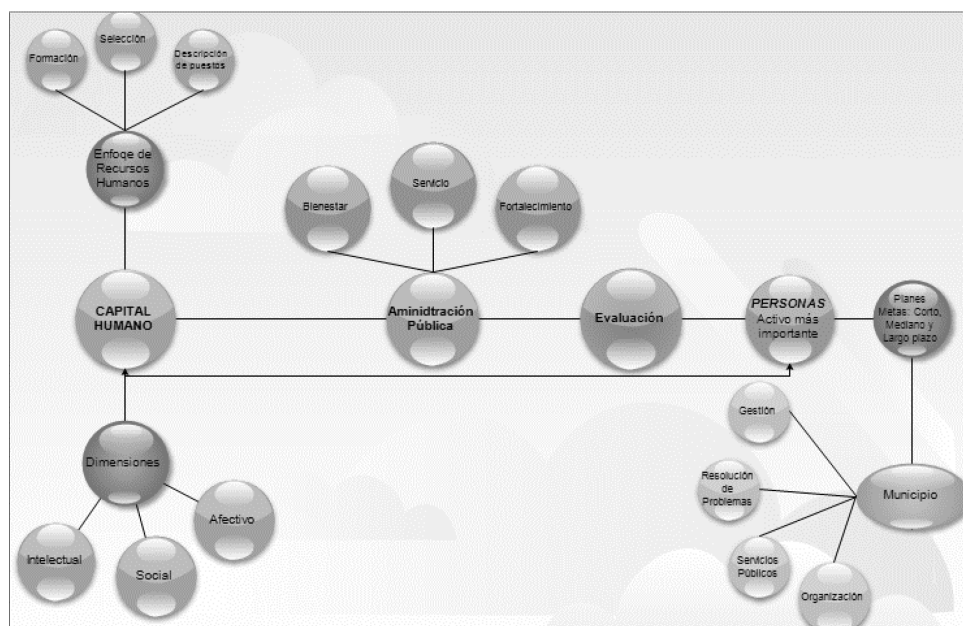

Estos elementos forman parte del soporte físico sobre el cual se puede dar el crecimiento de los centros de población de manera ordenada: redes eléctricas, calles y banquetas, redes telefónicas y plazas públicas (INAP, Administración y reglamentación del desarrollo urbano municipal: Guía Técnica 8, 1993). Los retos que enfrentan los municipios debido a los grandes cambios sociales, culturales, económicos, políticos, etc., deben generar planes que aseguren su modernización; nuestro país ha transitado hacia un perfil de un estado moderno, eficiente y competitivo, el reto de hoy es transitar hacia ayuntamientos modernos; pero sólo con ellos, los retos nacionales podrán enfrentarse con posibilidades de éxito en el futuro cercano (Montes de Oca Navas, 1996). El proceso de planeación puede ser implementado en el primer año de puesta en marcha, para obtener el sentido de cómo la planificación es conducida, y entonces enriquecerlo en los años posteriores con más fases y actividades, para asegurar una buena dirección y un buen cuerpo para organizaciones sin fines de lucro. La planificación generalmente es consumada por la administración del nivel superior. El proceso de planificación estratégica básica incluye (Arriagada, 2002):

Figura 1: Modelo de Planeación Estratégica

Fuente: Tomado de (Arriagada, 2002).

Figura 2: Modelo Causal

Fuente: Elaboración propia, con información del marco teórico.

De acuerdo a la figura anterior, el enfoque de recursos humanos está orientado a la descripción de puestos, selección y formación de los colaboradores; mismo que forman el capital humano de la organización, el cual está integrado de tres dimensiones: el capital intelectual, el capital social y el capital afectivo. Este capital, es quien le da vida y estructura a cualquier tipo de organización, incluyendo la Administración Pública, cuya función está basada principalmente en la búsqueda del bienestar y fortalecimiento de la ciudadanía a través de la gestión de servicios; asimismo, para valorar el impacto de estas gestiones, se recurre a la evaluación de quienes representan en su momento a la organización, es decir, a las personas que son el activo más importante de toda empresa; y que para poder desempeñar sus funciones, tendrán que planificar sus actividades y determinar sus metas a corto, mediano y largo plazo. Esta planificación, estará basada de acuerdo a las características y necesidades del municipio, quien transformará esas acciones en gestión de servicios, organización de sus actividades, resolución de conflictos y brindar los servicios públicos necesarios para el bienestar de la población.

METODOLOGÍA

La investigación tuvo un diseño mixto, conformado por un estudio cuantitativo-cualitativo no experimental de tipo longitudinal de tendencia, la cual se realiza sin manipular deliberadamente variables mediante la recolección de datos a través del tiempo en unos puntos o periodos, para hacer inferencia respecto al cambio, sus determinantes, consecuencias y relaciones entre ellas (Hernández, 2006). La hipótesis de la investigación es una hipótesis correlacional bivariada parcialmente explicativa, ya que la evaluación al desempeño de la administración pública municipal depende del capital humano de las autoridades municipales. La investigación para comprobar la hipótesis se basó en la técnica de investigación cualitativa y cuantitativa. Las técnicas de investigación cualitativa fueron: análisis de información bibliográfica y entrevistas. Análisis de fuentes secundarias; recopilación bibliográfica que señale el enfoque, estrategias metodológicas y evaluación del desempeño de la administración pública del Municipio de Santo Domingo Tomaltepec. La técnica de investigación cuantitativa se basó en un cuestionario aplicado a los autoridades municipales para calificar el capital humano de las autoridades municipales, de igual manera para la evaluación del desempeño de la administración pública se aplicó una muestra piloto a 50 habitantes del municipio para operacionalizar las variables de investigación. Se evaluó el desempeño de la administración

pública y el capital humano teniendo como actores principales del H. Ayuntamiento y la sociedad. Para medir el capital humano se aplicó un cuestionario a los integrantes del H. Ayuntamiento, donde se integran 25 indicadores: nivel educativo, capacitación, tipo de gobierno, fuentes de ingresos, situación municipal, migración, potencialidades municipales, cuotas que cobrar, etc. Con los datos obtenidos se generó una matriz de datos y se archivó, en el cual se nombraron los datos codificados en valores numéricos, para generar las bases de datos para utilizar el programa estadísticos SPSS versión 19.

RESULTADOS

La matriz de componentes reflejó las saturaciones de cada variable en cada uno de los trece componentes, se aprecia que el primer componente está constituido por las variables que forman el componente llamado: *Actividades que desempeña la administración pública municipal* formado por los indicadores: escala (.454), cambios (.462), agua (.544), drenaje (.596), luz (.738), gestserv (.762), obrapub (.735), zona (502), negocio (.696), requisit (.436), estables (.544), tiempo (.598), otrompo(.555). El segundo componente recibe el nombre de: *Evaluación de la administración pública municipal* formado por los indicadores: califica (.534), servicio (.583), seguridad (.625), ley (.520), admini (.593), educa (.675), agua (.454), sermed (.640), cabmpal (.490), Gobierno (.421). El tercer componente recibe el nombre de: *Apreciación de los ciudadanos antes y después de la nueva administración* formado por los indicadores: esperar (.546), relación (.570), anterior (.636), ingreso (.417), situacio (.479), cambios (.471), drenaje (.471), Luz (.471), tiempo (.480).

El cuarto componente recibe el nombre de: *Calificación en la administración pública en el desarrollo económico del municipio* formado por los indicadores: califica (.628), cabmpal (.543), habita (.446), cuanto (.475), cuanto (.456), tiempo (502). El quinto componente recibe el nombre de: *Evaluación de la administración pública en el desarrollo empresarial* formado por los indicadores; califica (.486), cuanto (.584), cuanto (.574). El sexto componente recibe el nombre de: *Aprobación de la administración pública municipal a través de los usos y costumbres* formadas por los indicadores; labor (.402), ingreso (.465), particip (.486), zona (.482), cual (.471). El séptimo componente recibe el nombre de: *Evaluación de la administración pública municipal en seguridad* formado por los indicadores; servicio (.428), delito (.540), cuanto (.442), cuanto (.458). El octavo componente recibe el nombre de: *Evaluación de la administración pública municipal actual en la economía del municipio* formado por los indicadores; situación (.420), actual (.435), habita (.415). Los últimos cinco componentes: nueve, diez, once, doce y trece componentes reciben el nombre de: *Evaluación del desempeño del Honorable Ayuntamiento Municipal* formado por los indicadores; labor (.573), esperar (.424), escala (.429), miembro (.382). Resultados del análisis factorial se identificaron 13 componentes de la evaluación del desempeño de la administración pública municipal. Por lo que la hipótesis de investigación de que existe una correlación positiva alta entre el capital humano y la evaluación al desempeño en la administración pública municipal en el Municipio de Santo Domingo Tomaltepec Oaxaca, se acepta, dado que los resultados del análisis factorial, la población del municipio pudo evaluar el desempeño de la actual administración.

CONCLUSIONES

En respuesta a la pregunta de investigación ¿El capital humano es una condición indispensable para evaluar el desempeño de la administración pública municipal? Que los municipios que se rigen a través del sistema normativo interno, cuentan con capital humano que les permite desempeñar las actividades de la administración pública municipal; asimismo, los gobernados tienen la capacidad de evaluar el desempeño de dicha administración dado que el resultado de la prueba piloto aplicada a la muestra de la población del municipio permitió identificar trece componentes de la evaluación del desempeño de la administración pública municipal siendo estos: Actividades que desempeña la administración pública municipal, Evaluación de la administración pública municipal, Apreciación de los ciudadanos antes y después de la nueva administración, Calificación en la administración pública en el desarrollo económico del municipio, Evaluación de la administración pública en el desarrollo empresarial, Aprobación de la administración

pública municipal a través de los usos y costumbres, Evaluación de la administración pública municipal en seguridad, Evaluación de la administración pública municipal actual en la economía del municipio, y los últimos cinco componentes: nueve, diez, once, doce y trece reciben el nombre de: Evaluación del desempeño del Ayuntamiento. La investigación llevada a cabo logra el objetivo general de identificar si el capital humano es una condición indispensable para la evaluación del desempeño en la administración pública municipal, con los resultados obtenidos del cuestionario aplicado a los integrantes que forman el H. Ayuntamiento, se hace la observación que el capital humano de los mismos en formación académica es del 100% que saben leer y escribir, se cuenta también con capital intelectual, capital afectivo o emocional, de igual modo el capital relacional que menciona Viedma; ellos tienen la habilidad de organizarse para interactuar positivamente con los miembros de la comunidad y tener una interacción con agentes externos, de igual modo Casanova menciona el capital social que los integrantes de la administración municipal lo han obtenido a través del tiempo dado que han demostrado tener una influencia positiva en la población. Cuentan con un capital estructural donde se incluyen activos intangibles que les permite dar una forma de organización y de apoyarse coordinadamente en sus diferentes funciones, algo importante que se debe de tomar es la cultura que tiene el municipio unidad de análisis.

Dentro de los objetivos específicos, se logra el de elaborar un perfil socioeconómico, en el cual el municipio cuenta con un total de 2,790 habitantes con una tasa de crecimiento poblacional del 4.5%, dado que el municipio unidad de análisis se ubica en la zona conurbada de la ciudad de Oaxaca de Juárez, por lo que su cercanía a la ciudad, se reporta población flotante que se dedica a actividades terciarias en un 46%, quedando en segundo lugar el sector industrial con un 33% resaltando las actividades de panadería, se identifica también, que el municipio se encuentra en el grupo de alta marginación, ya que su población de 15 años o más reporta un 7.96% de analfabetismo; el 35.18% de su población de 15 años y más no tiene la primaria terminada; en las condiciones de la vivienda el 2.45% de las viviendas particulares habitadas no cuentan con drenaje ni excusado; el 3.16% de las viviendas habitadas sin energía eléctrica; el 27.59% sin agua entubada; 37.73% con algún nivel de hacinamiento; el 21.97% con piso de tierra. El 58.15% de la población ocupada se encuentra por debajo de la línea de pobreza dado que es la población que reporta recibir menos de dos salarios mínimos, el Producto Interno Bruto del municipio del año 2005 permitió conocer el ingreso per cápita de la población de \$49,669.00. El segundo objetivo específico se logra con la realización del modelo causal que permitió resumir las teorías del enfoque estratégico de recursos humanos al enfoque de capital humano, mismo que da vida y estructura a cualquier organización, mediante sus tres dimensiones: capital intelectual, capital social y capital afectivo; a través de los cuales se evalúan a los integrantes de las mismas para valorar el impacto de las gestiones que tienen a su cargo; dado que la unidad de análisis Municipio de Santo Domingo Tomaltepec se encontraron esos recursos humanos.

El modelo de Miller toma a la inteligencia y conocimientos con visión única como fuente de liderazgo a través del talento individual y el compartimiento de conocimiento; para llevar a cabo productos innovadores mediante un capital de renovación (propiedad intelectual e innovación en servicios) y un capital estructural (a través de procesos y documentación); y por último relaciones de alta integridad con colaboración, a través de un capital relacional. El modelo causal adopta la propuesta de capital humano de Gratton, el cual menciona que las personas cuentan con tres tipos de recursos: un capital intelectual, constituido por las habilidades, los conocimientos y la experiencia; un capital social, formado por la estructura y la calidad de las redes y relaciones que establece con su entorno; y un capital emocional, el cual está dado por la confianza y la valentía para actuar; estos tres recursos constituyen su capital humano individual.

La pirámide de Maslow nos permitió identificar la autorrealización, reconocimiento, afiliación, seguridad, fisiología, que son las necesidades superiores que se pudieron identificar en el área de estudio; dichas necesidades se activan una vez que se hayan satisfecho las necesidades inferiores y que por consiguiente la motivación como tal. El modelo teórico de acuerdo a la figura 2, retoma la planeación estratégica municipal para salvaguardar los intereses de la comunidad y solucionar los problemas que ésta enfrenta, para construir escenarios futuros acordes a las necesidades de los ciudadanos; la cual es importante para que la

administración pública dé como resultado el bienestar, servicio y fortalecimiento; el mismo modelo, toma en cuenta la evaluación que es la condición indispensable para el desempeño del administración pública municipal. El tercer objetivo específico se logra, primero operacionalizando las variables de la administración pública municipal que toma en cuenta: El nivel de aceptación del actual gobierno, la calificación del desempeño de la administración, Oportunidades y desarrollo, el bienestar familiar y expectativas, la seguridad pública, el estado de derecho y, la gestión municipal; de igual manera la operacionalización de las variables que midieron el capital humano las cuales fueron: Labor, Esperar, Escala, Calificación, Relación, Anterior, Ingreso, Situación, Servicio, Familia, Seguridad, Miembro, Delito, Ley, Paz, Participación, Cambios, Calificación, Administración, Educación, Agua, Drenaje, Luz, Servicios, Médicos, Gestión de los Servicios, Obras Públicas, Actual, Honorable Ayuntamiento Municipal, Gobierno, Zona, Cual, Habita, Negocio, Requisitos, Pagar, Cuánto, Establecimiento, Cuánto, Tiempo y Facilidades. El modelo de correlación de las variables permitió dar respuesta a la hipótesis de investigación que cita de la siguiente manera Existe una correlación positiva alta entre el capital humano y la evaluación al desempeño en la administración pública municipal, el método de comprobación fue el de componentes principales que dio como resultado una KMO (.608) y una significancia de .000 lo que indicó que era factible aplicar el análisis factorial. La tabla de comunalidades reflejó que la mejor variable explicada es el Ayuntamiento con 99.4%, el mismo modelo tuvo una varianza total explicada de 81.29% de que la variabilidad contenida en los datos era necesario extraer trece componentes que emitieron evaluar la administración pública municipal.

BONDADES DEL USO DE INTERNET EN EL FOMENTO DEL HÁBITO DE LA LECTURA DE COMPRENSIÓN EN LOS UNIVERSITARIOS DE LA LICENCIATURA EN CONTABILIDAD: UNA EXPERIENCIA PARA COMPARTIR

Gladys Hernández Romero, Universidad Juárez Autónoma de Tabasco

José Manuel Piña Gutiérrez, Universidad Juárez Autónoma de Tabasco

Nidia Hernández Romero, Universidad del Valle de México

RESUMEN

Hablar del empleo que de las tecnologías y en especial del internet hacen nuestros universitarios es algo común, ya que las ventajas que proporciona su uso como medio de información, como facilitador de las relaciones sociales y en general como instrumento de ocio son bien conocidas por ellos. Tomando en cuenta esta realidad, se decidió aprovechar estas bondades para fomentar en los alumnos de la Licenciatura en Contabilidad, la lectura de comprensión. El tema se aborda desde la línea de investigación de Innovación Tecnológica que cultivan los integrantes del grupo de Investigación Innovación Educativa en los Procesos de Enseñanza y de Aprendizaje, de la Universidad Juárez Autónoma de Tabasco. Al momento de administrar los instrumentos de medición diseñados para este trabajo, todos los participantes, alumnos de esta institución cursaban el primero, tercero o quinto ciclo de la Licenciatura en Contabilidad. El trabajo muestra evidencias de la manera en el que el uso de internet ha influido de manera positiva en el desarrollo de su gusto por la lectura de comprensión. Los resultados apuntan hacia el nacimiento de una nueva forma de estimular a los alumnos para lograr una buena comprensión lectora, facilitándose de esta forma la relación profesor alumno.

BENEFITS OF INTERNET USE IN THE PROMOTION OF READING COMPREHENSION'S HABITS IN THE UNIVERSITY STUDENTS OF ACCOUNTANT DEGREE: AN EXPERIENCE TO SHARE

ABSTRAC

Talking about the employment of technology and especially the internet, make our university students something common, since the advantages of its use as a means of information, as a facilitator of social relationships and in general as a means of entertainment are well known to them. Taking this into account, we decided to take advantage of these benefits to encourage students in the accountant degree, the reading comprehension. The topic is approached from the research of Technological Innovation in the group of Educational Innovation in the Education and Learning process, at the Universidad Juárez Autónoma de Tabasco. At the moment to apply the instruments designed for this study, all the participants (students) were studied in the first, third and fifth cycle of counting degree. This work shows evidences of the way in which Internet use has had a positive influence on the development of his taste for reading comprehension. The results point to the birth of a new way to encourage students to get a good reading, thus facilitating the student teacher relationship.

KEYWORDS: New Technologies, Accounting, Reading, Teacher Student Relationship

INTRODUCCIÓN

La incorporación de un medio tecnológico distinto al pizarrón clásico, puede ser un incentivo para el estudiante, que cansado de recibir clases a través de éste precisa un cambio. Las Instituciones de Educación Superior actualmente tienen un reto ante el cómo enseñar a sus alumnos que día con día incorporan el uso de la tecnología a su forma de vida. La inserción de estas nuevas tecnologías, en especial del internet a la vida de los universitarios, ha generado retos para el almacenaje, transmisión y recepción de los conocimientos, siendo una necesidad por parte del docente mantenerse actualizado en el tema. Las estrategias de Enseñanza-Aprendizaje en educación deben ser efectivas y asegurar la transmisión eficaz de lo que se enseña. (Blanco, Ornelas, Rodriguez, Viciano, y Zueck 2013).

Partiendo de lo anterior, la forma en la que los universitarios abordan la lectura sigue siendo un tema interesante a tratar, sobre todo porque ellos consideran el internet como una extensión de su cuerpo. El desarrollo de esta nueva tecnología de la información y la comunicación, ha supuesto un impacto de profundas dimensiones para la docencia, teniéndose la necesidad de realizar una gran transformación en los modelos educacionales que se han venido utilizando hasta el presente, además, en los entornos mediados por el internet (como es el caso de los universitarios tabasqueños), es necesario fortificar a los usuarios como potenciales sujetos de aprendizaje. (Fainholc, 2005). Este trabajo de investigación se llevó a cabo con la participación de 95 estudiantes de la licenciatura en Contabilidad, de la División Académica de Ciencias Económico Administrativas, perteneciente a la Universidad Juárez Autónoma de Tabasco, localizadas ambas en la Zona de la Cultura de Villahermosa Tabasco, México. En esta División Académica se ofertan también las licenciaturas en Administración, Economía, y Mercadotecnia. Cuenta con un total de 238 profesores, de los cuales 88 son mujeres y 150 son hombres.

Desarrollo

Actualmente el uso del internet está presente en todos los ámbitos académicos y la Universidad Juárez Autónoma de Tabasco no es la excepción, y su aplicación en este nivel se deja ver como una oportunidad para la innovación. Tomando en cuenta la importancia que tiene la lectura de comprensión en los universitarios y su reticencia a la lectura, se ideó una estrategia a fin de lograr que éstos la disfrutaran, y es que la variedad de formas utilizadas para representar y transmitir la información requiere de estudios que ayuden a explicar qué hacen los alumnos y qué aprenden mediante este tipo de prácticas, cómo desarrollan su función educativa y cómo establecen comunicación con sus pares. (Islas, Navarro, Ruiz, De la Torre, y Baltazar, 2013). Aprovechando que la presencia del internet en el aula ha implicado cambios en las modalidades de enseñar y de aprender, y procurando dar respuesta a las diferentes necesidades formativas donde los conocimientos, los tiempos, las características de los estudiantes y los recursos al alcance se entremezclan y configuran escenarios de formación a los que docentes y alumnos deben habituarse, se procedió a invitarlos a leer el material enviado por los profesores a través del internet a sus correos electrónicos y a la página del facebook creada para este fin, y es que es necesario propiciar lecturas no solo para acceder a obras producidas por otros y reflexionar acerca de ellas, sino también para producir otras nuevas. (Fainholc 2005).

Según lo expuesto por algunos de los participantes en este estudio, la lectura de comprensión realizada en el salón de clases y usando libros, les da sueño y se les dificulta el entenderla, recordemos que la actividad de leer es una operación eminentemente activa que requiere la capacidad de aprendizaje. (Fainholc, 2005). En este sentido, la comunicación entre los actores de los procesos de enseñanza y de aprendizaje toma una importancia relevante. Jordi Adell (2003) considera una caza del tesoro al hecho de incorporar el internet en el aula, ya que es una actividad además de didáctica, muy sencilla de emplear. Esta innovación no representa en ningún momento una alteración o modificación al modelo de enseñanza de la Universidad

Juárez Autónoma de Tabasco, ya que en el Plan de Desarrollo Institucional (2012) 2012-2016 queda asentado que es una institución en constante mejoría, comprometida con la sociedad a la que sirve y sustentada en su autonomía institucional y la libertad académica, que realiza notables esfuerzos para ampliar el acceso de los jóvenes y garantizar la calidad de sus servicios y de los productos de su quehacer académico, y es que la tecnología juega un papel importante en el aprendizaje porque proporciona una variedad de herramientas que el profesor puede utilizar. (Doménech, 1999)

METODOLOGÍA

Este trabajo de investigación se llevó a cabo con la participación de 95 estudiantes de la licenciatura en Contabilidad, de la División Académica de Ciencias Económico Administrativas, una de las once Divisiones Académicas que forman la Universidad Juárez Autónoma de Tabasco. Esta División Académica se encuentra localizada en la Zona de la Cultura en Villahermosa Tabasco, México; y en ella se ofertan además de la licenciatura en Contabilidad, las licenciaturas en Administración, en Mercadotecnia y en Economía. Actualmente su matrícula es de 3952 estudiantes distribuidos en las cuatro licenciaturas. Los instrumentos utilizados para la medición, fueron dos cuestionarios semiestructurados y aplicados en distintos momentos durante los meses de febrero a junio de 2014. El cuestionario de entrada consta de 25 preguntas de opción múltiple y sirvió para detectar a la población con las características que se requerían: estudiantes inscritos en el primero, tercero y quinto ciclo de la licenciatura en Contabilidad, y que fueran usuarios frecuentes del internet. En un segundo momento se administró un cuestionario con 10 preguntas semiestructuradas a estudiantes que respondieron afirmativamente al 70% de los reactivos de la encuesta de entrada. El estudio empírico, se basó en una muestra intencional o de conveniencia de 95 estudiantes de un total de 300, sin importar el género.

$N=300$ $S^2 = P(1 - P)$ y si suponemos que $P = 0.95$ entonces

$$S^2 = 0.95 (1 - 0.95) = 0.0475 \text{ y } V^2 = (Se)^2 \text{ cuadrado del error.}$$

Y el error estándar es $Se = 0.015$ lo determina el investigador teniendo los datos anteriores, por lo tanto el

tamaño de la muestra es:
$$n' = \frac{S^2}{V^2} = \frac{0.0475}{(0.015)^2} = \frac{0.0475}{0.000225} = 95$$

Los datos arrojados por el cuestionario de salida sirvieron de base para la elaboración del escrito que se presenta. Para la sistematización de los mismos, se utilizó el programa SPSS que arrojó las tablas necesarias para su posterior teorización. Las preguntas abiertas fueron analizadas mediante el análisis de narrativas, identificando las categorías centrales y vinculándolas con los datos duros. El estudio reporta aspectos relacionados con las siguientes categorías: gusto por la lectura, uso del internet, relación profesor-alumno.

CONCLUSIONES

Los datos arrojados en el estudio, confirman que los jóvenes estudiantes universitarios población objeto de estudio, han incorporado el internet a la mayor parte de sus actividades cotidianas. Para los estudiantes de hoy “hacer la tarea” puede alargarse el tiempo necesario sin que ello les cause preocupación alguna, dado que la actividad es intercalada con otros quehaceres, por lo que el espacio de tareas y recreación es el mismo, potencializado con los aparatos electrónicos necesarios para mantener una comunicación permanente. Los hábitos de los participantes en este estudio están mediados por la convivencia con la tecnología; el 100% cuenta con equipo en su domicilio, 98% de ellos realiza al menos tres tareas de manera

simultánea: chatear con sus amigos (varios a la vez), ver series de televisión y realizar actividades relacionadas con tareas escolares. Lo que supone una transformación física y simbólica de la realidad tal como la concebíamos hasta tiempos recientes. Ellos estuvieron a gusto con esta forma de trabajar en la que a partir del empleo de la tecnología, hacían sus tareas, considerando una forma entretenida y divertida de cumplir con sus deberes académicos. La mensajería instantánea como facebook, Youtube y Skipe son las aplicaciones más utilizadas por los universitarios, en segundo término se utiliza el correo electrónico por razones de tiempo y rapidez. Las redes sociales se han convertido en el vehículo principal para comunicarse con el mundo y a diferencia de quienes descalifican estas preferencias y las ligan con el desinterés y la indiferencia, los jóvenes han logrado hacer de esta herramienta la prolongación de su hábitat.

BIOGRAFÍA

Gladys Hernández Romero es Doctora en Educación. Profesora de tiempo completo en la Universidad Juárez Autónoma de Tabasco (México). Miembro desde 2012 del padrón estatal de investigadores, y desde 2013 del sistema estatal de investigadores. Acreditada durante el periodo comprendido entre junio 2013 y junio 2016 ante la Asociación Nacional de Facultades y Escuelas de Contabilidad y Administración.

José Manuel Piña Gutiérrez es Maestro en Administración por la Universidad Juárez Autónoma de Tabasco, Doctor en Administración por la Pacific Western University de California en los Estados Unidos de América. Actualmente es Presidente del Consejo Ciudadano del Premio Nacional de Periodismo A.C. Profesor de tiempo completo en la División Académica de Ciencias Económico Administrativas, perteneciente a la Universidad Juárez Autónoma de Tabasco.

Nidia Hernández Romero es Maestra en Literatura Latinoamericana Contemporánea. Profesora en la Universidad del Valle de México, Campus Lomas Verdes, desde 1990. Imparte la asignatura Competencias Lingüísticas. Ha participado como expositora en diversos foros y congresos nacionales e internacionales.

CONFLICTO DE NORMAS EN LA EMPRESA FAMILIAR: ESTUDIO DE CASO EN MONCLOVA, COAHUILA, MÉXICO

RESUMEN

Familia y empresa son dos sistemas que se rigen por normas diferentes. Este trabajo analiza y describe la forma en que las contradicciones existentes entre estas normas se manifiestan y generan conflictos en los procesos de selección de personal, remuneración, evaluación y capacitación de los recursos humanos en una empresa familiar. Se empleó el método de estudio de caso el cual consiste en la investigación empírica de un fenómeno contemporáneo, a través del enfoque cualitativo y dentro de su contexto de la vida real. Para este proyecto se eligió una empresa familiar denominada Ferretera Madero, S.A., ubicada entre dos ciudades conurbadas: Monclova y Frontera, Coahuila. Para asegurar la confiabilidad se procedió a la triangulación de diversas fuentes de información: investigación documental, entrevistas y cuestionarios. Los resultados obtenidos determinan la necesidad de establecer un equilibrio entre las demandas de la familia y la rentabilidad de la empresa. Esto con el fin de cumplir con las normas que rigen a la familia, sin violentar las normas que rigen la lógica empresarial.

PALABRAS CLAVES: Empresa Familiar, Conflicto de Normas

GUIDELINES CONFLICT IN THE FAMILY BUSINESS: CASE STUDY IN MONCLOVA, COAHUILA, MÉXICO

ABSTRACT

Family and enterprise are two systems that rule over under different sets of norms. This investigation analyses the way this divergence become apparent and generates conflicts in the processes of personnel selection, compensations, evaluation and training at the Human Resources department in a Family Enterprise. It was used the case study method which consists in the empirical research of a contemporary phenomenon, through a qualitative approach and within a real life context. For this project it was chosen a family business named Ferretera Madero, S.A. located between two adjacent cities: Monclova and Frontera, Coahuila. To assure the reliability it was made a triangulation of several information sources: documentary research, interviews and questionnaires. The results obtained determine the need to establish a balance between the family demands and the business profitability. This with the aim to comply with the rules that govern the family, without distorting the rules that regulates the business logic.

INTRODUCCIÓN

Una de las características más importantes de cualquier grupo en la sociedad es la creación de sus propias normas. Para que una persona sea admitida y permanezca en un grupo, el individuo debe aceptar y comportarse de acuerdo con dichas normas. No cumplir con estas conlleva el riesgo de ser criticado, amonestado y en algunos casos, rechazado. Definimos la norma como una línea de conducta, un patrón aceptable de comportamiento para las personas en un grupo social. Son un conjunto de reglas que indican a las personas lo que deben hacer o no ante determinada situación, pero también lo que se espera ellas (Gross, M. 2009). Una vez que las normas han sido establecidas y aceptadas, estas influyen en el comportamiento de los individuos, sin que sea necesario ejercer un control sobre éstos.

Sin embargo, las normas pueden entrar en conflicto, por ejemplo, en una empresa familiar. Uno de los aspectos en que los sistemas familiar y empresarial son notablemente contradictorios entre sí tiene que ver con las normas que rigen el comportamiento del individuo en la familia y las normas que rigen su comportamiento en la empresa. Es decir, lo que se espera de un individuo de acuerdo con las normas familiares es opuesto a lo que se espera de ese mismo individuo según los principios de la organización (Gross, M. 2009). Por ejemplo, una norma que prevalece en la familia es brindar protección y apoyo incondicional hacia sus miembros. En una empresa, el apoyo es condicionado y está en función de los objetivos logrados y de la contribución de cada individuo. En una empresa no familiar, cumplir con las normas organizacionales no representa ningún conflicto. Si un empleado no cumple con las normas de la organización este puede ser despedido sin que se dañen los lazos afectivos entre la familia del trabajador y el dueño de la empresa. Sin embargo, en una empresa familiar el director o dueño enfrenta el dilema de responder a las demandas de la familia para cumplir con sus respectivas normas o bien, sacrificar a la familia con el fin de mantener la rentabilidad y competitividad de la empresa.

Esta investigación surgió de la necesidad de dar respuesta a la siguiente pregunta de investigación: ¿Cómo se manifiesta en una empresa familiar el conflicto entre las normas familiares y las de la organización? Por tanto, nuestro trabajo tiene como objetivo, identificar y explicar la forma en que las normas que rigen en la familia entran en conflicto con las normas que se manejan en la organización en una empresa familiar. Así como proponer algunas orientaciones para que el fundador o director de una empresa familiar cumpla con las normas que rigen a la familia, sin violentar las de la organización.

REVISIÓN LITERARIA

Contradicciones Entre las Normas del Sistema Familiar y el Empresarial y Su Impacto En los Recursos Humanos de la Empresa Familiar

Cuando una familia doméstica se convierte en empresaria su dinámica se torna diferente y más compleja ya que en la empresa familiar interactúan dos sistemas con normas divergentes entre sí. En el contexto de la familia, operan dos normas para garantizar la imparcialidad: En las relaciones familiares verticales (relación entre padres e hijos) la norma dominante de imparcialidad es el concepto de necesidad. Los padres tienen la obligación moral de distribuir los recursos necesarios para satisfacer las necesidades de sus hijos. En las relaciones familiares horizontales, como lo es la relación entre hermanos, cada individuo tiene el derecho de recibir equitativamente los mismos recursos y oportunidades (Belausteguigoitia, 2010). Estas normas para garantizar la imparcialidad en la familia son contrarias a las normas que operan en la empresa. En el sistema empresarial, la imparcialidad está basada en el concepto de mérito. Idealmente, el nivel de recompensa que un empleado recibe está determinado por su capacidad para cumplir con las metas de la organización y los resultados aportados. De tal forma que los que son más productivos deben recibir mayor cantidad de recursos disponibles.

Algunas de las contradicciones existentes entre las normas familiares y las de la organización pueden observarse en los procesos de selección de personal, compensaciones, evaluación al desempeño y capacitación de la empresa familiar (Lansberg, 1983). A continuación se describe las contradicciones referidas y que muestran la divergencia que existe entre las normas que rigen el sistema familiar y el empresarial.

Selección de Personal: En la empresa no familiar existe un proceso y requisitos establecidos para la selección de los recursos humanos. Estos deben cumplir con el perfil del puesto al que aspiran, contar con los créditos profesionales, experiencia y capacidad requerida por la empresa contratante. En este contexto, la empresa familiar enfrenta un problema. Frecuentemente, la familia se siente con ciertos “derechos” para solicitar trabajo o participación en la empresa familiar independientemente de su capacidad, preparación o talento. Se petición se basa en que de acuerdo con los principios que operan en la familia, se debe proporcionar apoyo condicional a aquel miembro de la familia que lo necesite. El dueño, frecuentemente se encuentra en la disyuntiva de elegir entre contratar o no a un familiar que es incompetente. Sí no lo contrata pone en riesgo la relación con la familia. Pero, sí lo contrata la rentabilidad y competitividad de la empresa pueden verse amenazadas (Lansberg, 1983).

Compensaciones: Dentro del área de compensaciones, la remuneración de los parientes que laboran en la empresa también representa un problema para el fundador. El conflicto aquí también, es estructural. Los sociólogos afirman que las normas y principios que regulan el proceso de dar y recibir en la familia son cualitativamente diferentes de las normas y principios que regulan el mismo proceso en la empresa. El intercambio de recursos en la familia se basa en principios implícitamente afectivos. La satisfacción de las necesidades y el bienestar de la familia es un deber por el simple hecho de ser pariente. En contraste, el proceso de dar y recibir que opera en la empresa está regulado por principios económicos que explícitamente establecen un valor a los bienes y servicios que se ofrecen y el tiempo en el que se ofrecen. Este caso se presenta típicamente con los hijos del dueño que trabajan en la empresa. Por tanto, la compensación para los parientes está frecuentemente basada en principios ambiguos que se derivan de un híbrido entre los criterios de la familia y de la empresa y de esta forma generan todo tipo de procesos disfuncionales en el negocio (Lansberg, 1983).

Evaluación del desempeño: El traslape entre los sistemas empresa y familia interfiere con el proceso de evaluación del desempeño. Frecuentemente el fundador experimenta gran dificultad cuando trata de evaluar el desempeño de los parientes cercanos que trabajan en la empresa, especialmente, cuando se trata de evaluar objetivamente el desempeño de sus hijos. En primer lugar, el concepto mismo de evaluar objetivamente la contribución y valor de un hijo, esposa, etc., resulta absurdo desde el punto de vista familiar. El lugar de un individuo en una familia está determinado más por lo que “es” que por lo que “hace”. Al contrario, en la empresa el proceso de evaluación es totalmente congruente con los requerimientos de un sistema cuya función principal es la productividad económica. No es de sorprenderse que para el fundador, evaluar la capacidad o competitividad de su hijo represente una fuerte carga de estrés. Porque no es posible ser justo y cumplir simultáneamente con las normas que operan en el sistema familiar y el de la empresa (Lansberg, 1983).

Capacitación y desarrollo: El choque entre las normas y principios que operan en la familia y en la empresa también impacta la habilidad del fundador para administrar la capacitación de los miembros de la familia. En este caso, el fundador frecuentemente encuentra difícil separar los intereses de capacitación de los familiares que laboran en su empresa, de las necesidades de la organización. Desde un punto de vista familiar, la capacitación de los familiares debe estar enfocada hacia lo que es mejor para ellos o de acuerdo a sus intereses. Desde el punto de vista de la empresa, la capacitación debe enfatizar experiencias de aprendizaje que incrementen la capacidad del individuo para lograr las metas organizacionales. Frecuentemente, los intereses de capacitación de los familiares empleados, no coinciden con las de la empresa. Inclusive, el fundador puede desear invertir una considerable cantidad de recursos en determinada capacitación de algún familiar, cuando dicha capacitación no es congruente con las necesidades de la organización. En este caso, el fundador o director puede encontrar difícil distinguir la diferencia entre los deseos de capacitación de su descendencia y las necesidades de la organización. Pues desde un punto de

vista familiar, la capacitación debe enfocarse hacia lo “que es lo mejor para los hijos”. Mientras que desde el punto de vista de la organización, la formación y capacitación debe enfocarse hacia aquel aprendizaje que incremente la competencia y habilidad de la persona para alcanzar las metas trazadas por la organización (Lansberg, 1983). Pocos son los estudios realizados sobre esta problemática (Antognilli, 2009). Sin embargo se sabe que frecuentemente los directivos de una empresa familiar:

1. Tienden a carecer de los conocimientos técnicos y formales sobre recursos humanos y se guían principalmente por la intuición o por intereses familiares (Grabinsky, 2010). Por ejemplo, frecuentemente las empresas familiares carecen de un diseño de la estructura organizacional de la empresa, la cual permite asegurarse que los puestos de trabajo sean congruentes con las necesidades y recursos del negocio. De tal forma que el reclutamiento en este tipo de empresas muchas veces se realiza sin orden, ni control, favoreciendo especialmente la entrada de familiares (Rodríguez-Fornos, 2008). Prestan poca importancia a la aplicación de las prácticas de recursos humanos como medio de control ya que en este tipo de empresas, por ejemplo, los miembros de una empresa familiar tienden a ser evaluados por el fundador, es decir, desde una perspectiva más emocional que objetiva o racional (Sánchez, 2012).

Frecuentemente tienen más dificultades en la aplicación de medidas efectivas para gestionar el recurso humano, pues es común encontrar una ausencia de equilibrio salarial entre los empleados de una empresa familiar. Diversas son las causas, pero la más común lo determina el hecho de ser o no, parte de la familia empresaria (Rodríguez-Fornos, 2008). No definen claramente las funciones y responsabilidades de los empleados familiares lo que genera que todos hacen de todo y esto implica que nadie es responsable de algo (Antognilli, 2009). En general, suelen dar un tratamiento diferente a los miembros familiares especialmente en lo que se refiere a los procesos de reclutamiento, selección, evaluación y formación de personal (Mendoza-Moheno, Hernández-Calzada, y Salazar-Hernández, 2011). Este tipo de problemas es de tipo estructural y tiene que ver más con las contradicciones existentes entre las normas del sistema familiar y el organizacional (Álvarez-Martínez, M., 2011). Pues, reiterando, lo que se espera de un individuo con las normas familiares es opuesto a lo que se espera de ese mismo individuo en la organización.

METODOLOGÍA

Existe una diferencia entre el estudio de caso como técnica didáctica y el estudio de caso como método de investigación (Díaz, Mendoza, y Porras 2011). Como técnica didáctica, el estudio de casos consiste en proporcionar al alumno una situación problemática para su análisis y discusión dentro del aula y su finalidad es pedagógica. Como método de investigación, el estudio de caso consiste en la investigación empírica de un fenómeno contemporáneo dentro de su contexto de la vida real para contribuir a la gestión del conocimiento científico (Hancock & Algozzine 2011; Sampieri, et. al., 2010 y Yin, 2003). Feagin, Orum y Sjoberg (1991) describen este método como una multifacética investigación a fondo de un simple fenómeno social por medio del enfoque cualitativo. El fenómeno analizado puede ser una organización, un rol, un proceso, un evento, prácticas, un evento, etc. Esta investigación se llevó a cabo bajo la perspectiva del estudio de caso como método de investigación, ya que permite profundizar y tener un mayor conocimiento sobre la dinámica de la empresa familiar y los detalles sobre los sujetos de estudio (Aranda, Molotla y Nieto, 2012). Se determinó la pertinencia de este método de investigación dado que el problema objeto de estudio cumple con los tres requisitos establecidos por Yin (2003): Las preguntas de investigación deben girar en torno al cómo y/o porqué del fenómeno objeto de estudio. No se tiene control sobre los eventos que se están investigando, es decir, no es posible experimentar. El fenómeno objeto de estudio es contemporáneo, en lugar de un evento histórico. Se seleccionó un caso único: la empresa familiar denominada Ferretera Madero S.A. De este negocio se eligió como unidad de análisis, la interacción concurrente de las normas familiares y de la organización en un mismo contexto -la empresa- y tiempo -familiares laborando en la empresa al momento de realizar la investigación- (Martínez-Carazo, P., 2006). Con la finalidad expresa de cumplir con la ética de confidencialidad, el nombre del negocio y de la familia involucrada en el caso de estudio fue cambiado.

Por su finalidad o contribución teórica, el diseño de investigación para este estudio de caso corresponde al instrumental. Este diseño permite entender en mayor profundidad las explicaciones teóricas existentes a través del estudio de uno o varios casos reales. Respecto al alcance que se desea obtener en cuanto a la obtención de conocimientos, el diseño es descriptivo ya que tiene como finalidad obtener una descripción sobre cómo se manifiesta el conflicto de normas en una empresa familiar (Hancock y Algozzine, 2011). Por validez externa se entiende que tan generalizables son los resultados obtenidos de una investigación a otros sujetos o poblaciones; mientras que la confiabilidad se refiere al grado en que la aplicación repetida de un instrumento al mismo sujeto u objeto produce iguales resultados. Estas definiciones provienen de una tradición centrada en lo cuantitativo (Arzaluz-Solano, 2005). Por tanto, dado que el estudio de caso proviene del enfoque cualitativo, estas concepciones no pueden ser estrictamente aplicadas como ocurre en el enfoque cuantitativo. Sin embargo, una de las medidas recomendadas para cerciorarse de la confiabilidad en un estudio de caso es la triangulación: el empleo de múltiples fuentes para corroborar y verificar la información recopilada (Stake, 2007). Para cumplir con este requisito, se recurrió a la investigación documental –expuesta en el apartado de revisión literaria-. Posteriormente se administró la entrevista no estructurada al dueño de la empresa familiar y a los tres hijos que laboran en la misma. Dicha entrevista giró en torno a la pregunta sobre ¿Cuál es la situación que más le molesta como resultado de trabajar en esta empresa? También se incluyó la observación no participante. Con la finalidad de contribuir aún más a la triangulación se diseñó y administró, en el mes de mayo del 2014, un cuestionario a 27 dueños de empresas familiares de Monclova, Coahuila. Esto con el objetivo de corroborar el grado en que el conflicto de normas en las empresas familiares puede ser un patrón de comportamiento relativamente común. Las variables e indicadores que integraron dicho cuestionario se exponen en la tabla 1.

Tabla 1: Variables e Indicadores

Variable	Indicador	Items
Conflicto de normas en la contratación de familiares. (1-3)	-Existencia de proceso de selección de personal. -Existencia de protocolo para la contratación de familiares. -Presión para contratar a Familiares.	¿Tiene establecido un proceso de selección de personal? ¿Cuenta con un protocolo para normar la contratación de familiares? ¿Ejerce presión la familia en la contratación de algún familiar?
Conflicto de normas en la remuneración de los familiares que laboran en la empresa. (4-6)	-Existencia de protocolos para la remuneración de familiares empleados. -Incomodidad al momento de asignar un sueldo a los familiares empleados. -Definición del sueldo en base a las necesidades del familiar vs la establecida para el puesto.	¿Cuenta la empresa con un protocolo para normar la remuneración de familiares empleados? ¿Experimenta incomodidad al momento de asignar un sueldo a los familiares empleados? ¿Toma como criterio para la asignación del sueldo las necesidades del familiar empleado?
Conflicto de intereses en el tipo de capacitación de los familiares empleados. (7-8)	-Existencia de proyectos de capacitación acorde a las necesidades de la empresa. -Aceptación por parte de los familiares empleados en adquirir capacitación congruente con los intereses de la empresa.	¿Cuenta con proyectos para capacitar a su personal? ¿Aceptan los familiares empleados la capacitación que requieren para cumplir con las metas organizacionales?
Conflicto de normas en la Evaluación de familiares empleados. (9-11)	-Existencia de procedimientos de evaluación al desempeño. -Aplicación de dichos procedimientos a familiares empleados. -Incomodidad al momento de evaluar a un familiar que labora en la empresa.	¿Cuenta con un procedimiento para la evaluación al desempeño? ¿Aplica dicho procedimiento también a familiares empleados? ¿Experimenta incomodidad al momento de evaluar a sus familiares-empleados?

Dado que una variable tiene un grado de abstracción que de ordinario no puede ser utilizada como tal en la investigación, se procedió a operacionalizar las cuatro variables consideradas en el cuestionario: Conflicto de normas en la contratación de familiares; en la remuneración de los familiares que laboran en la empresa; en los intereses de capacitación y evaluación del desempeño de los mismos. Para cada una de estas variables se determinaron los indicadores con los cuales se construyeron los items que conformaron el cuestionario. Dicho cuestionario fue conformado por once items.

RESULTADOS

Con la información recopilada a través de las entrevistas realizadas se estructuró el caso objeto de estudio bajo la siguiente narrativa etnográfica:

Estudio de Caso: Ferretera Madero S.A

Después de haber laborado en Altos Hornos de México (AHMSA) Don Julián fue reajustado por dicha empresa siderúrgica en 1985. Con el dinero recibido por su terminación, Don Julián fundó una pequeña ferretera la cual debido a su ubicación estratégica -entre dos ciudades conurbadas-logró incrementar el volumen de sus ventas y crecer. Los tres hijos de Don Julián -Adolfo, Rodrigo y Blanca- y un sobrino -Alejandro- trabajan en la ferretera. Blanca fue la única de sus hijos que concluyó sus estudios profesionales en Contaduría y se desempeña como contadora en la Ferretera. Después de haber desertado de la carrera de Ingeniería en Informática, Adolfo quiso emigrar para trabajar en Estados Unidos, pero Don Julián le pidió que se quedara a ayudarlo en el negocio. Adolfo aceptó, pues siente gran respeto por su padre, pero no le gusta trabajar en este negocio. Rodrigo solamente cursó el primer semestre de la carrera en Administración de Empresas, pues prefirió trabajar. Su desempeño académico en la universidad no fue bueno. Ambos hijos consideran ser administradores del negocio. Alejandro es el único hijo de Doña Socorro, hermana de Don Julián, quien enviudó y por quien Don Julián se siente particularmente responsable de su sustento. Doña Socorro consiente mucho a Alejandro quien no quiso estudiar una carrera profesional. Don Julián considera que debe ser equitativo.

Por este motivo Blanca, Adolfo, Rodrigo y Alejandro reciben el mismo sueldo. Esto es causa de inconformidad, resentimientos y fuertes discusiones familiares, lo cual también ejerce una fuerte presión en Don Julián. Blanca se queja de tener una gran carga de trabajo y afirma que por ser la única con carrera profesional debería ganar un mayor sueldo. Adolfo y Rodrigo tienen una fuerte rivalidad, pues Adolfo expresa que su hermano no cumple con los horarios de trabajo, ni sus responsabilidades y que frecuentemente se duplican las funciones entre ellos. Rodrigo, Adolfo y Blanca no aceptan a Alejandro, pues lo consideran ser una persona muy caprichosa, irresponsable y que abusa del afecto que Don Julián siente por su hermana, Doña Socorro. El fundador de la Ferretera Madero, S.A. se siente abrumado por las constantes discusiones entre sus hijos e impotente para dar solución a la falta de cumplimiento por parte de Alejandro. No considera adecuado establecer diferencias en los sueldos de sus hijos, ni tampoco evaluar el desempeño de sus hijos y de Alejandro, pues piensa que no sería bien visto por la familia. La tabla 2 tiene como finalidad extraer y resaltar aquellas acciones que indican la existencia de conflicto entre las normas que rigen en la familia y las que se manejan en la empresa, así como el proceso o área en la que se ejerce un impacto negativo.

Los resultados que se obtuvieron a partir de la administración de un cuestionario a 27 dueños de empresas familiares se presentan en la tabla 3. Las preguntas 1, 2, 4, 7 y 9 fueron reactivos dicotómicos, es decir, las respuestas sólo podían ser sí o no al hacer referencia a si cuenta o no cuenta con procesos o protocolos, proyectos o procedimientos. El resto de las preguntas 3, 5, 6, 8, 10 y 11 tienen cuatro opciones -frecuentemente, ocasionalmente, raras veces y nunca- con una calificación de 4 a 1, frecuentemente con un valor de 4 hasta nunca, con un valor de 1.

Tabla 2: Acciones Que Demuestran la Existencia de Conflicto Entre las Normas Que Rigen Ambos Sistemas: Familiar y Empresarial

Acción	Área de Conflicto	Proceso En el Que Se Ejerce un Impacto Negativo
Integrar a familiares sin considerar su capacidad, preparación y características para cumplir con el perfil ocupacional.	El dueño piensa que es su deber proveer una fuente de empleo e ingreso a sus familiares. Independientemente sí reúnen las características para ocupar un puesto en la organización. Se antepone las normas familiares a las de la organización.	Selección de personal.
Conservar en la empresa familiares que tienen un deficiente desempeño y escaso deseo de mejorar su actuación.	Prevalece la norma de que los familiares deben apoyarse independientemente de las circunstancias. Pues no se considera aceptable el despido entre familiares.	Evaluación del desempeño del personal que labora en la empresa.
Otorgarles el mismo sueldo, independientemente del puesto y responsabilidades asignadas a familiares que laboran en la empresa.	Se antepone la equidad como un principio que rige en la relación horizontal entre la familia: equidad en la distribución de los recursos. En la organización la remuneración se basa en los logros y metas alcanzadas.	Remuneración o compensación: sueldos o salarios.
Negativa para someter a evaluación el desempeño de los miembros que laboran en el negocio.	De acuerdo con las normas familiares resulta absurdo someter a evaluación a un familiar. De acuerdo con las normas organizacionales, la evaluación es justa y requerida.	Evaluación del personal.
Existencia de familiares que carecen de preparación profesional.	De acuerdo con las normas organizacionales el perfil del puesto establece el grado de preparación profesional requerido para ocupar el mismo. Pasar por alto el cumplimiento de esta norma sugiere que las normas familiares están sobre las que rigen la lógica empresarial.	Capacitación.

En esta tabla puede observarse como determinadas acciones y decisiones tomadas por el dueño de la empresa familiar objeto de esta investigación, reflejan la ausencia de conocimiento sobre el hecho de que en una empresa familiar coexisten normas que son totalmente divergentes entre sí. Dichas acciones se convierte en fuente potencial de conflicto entre los familiares que laboran en la misma y de insatisfacción para el resto de los empleados que laboran en la misma. Si analizamos esta situación desde la perspectiva empresarial y especialmente desde la perspectiva de los trabajadores no familiares, se vislumbra cierto grado de injusticia. Esto es fuente de desmotivación para los trabajadores más rentables y comprometidos con la organización.

Tabla 3: Resultados Estadísticos del Cuestionario Administrado a 27 Dueños de Empresas Familiares

Ítem	Media	Mediana	Moda	Desv.Std.	Varianza	Rango
1 Proceso de selección establecido.	.444	.0000	.00	.84732	.718	4.00
2 Protocolo para la contratación de familiares.	.3704	.0000	.00	.49210	.242	1.00
3 Presión contratación de familiares.	3.8519	4.0000	4.00	.36201	.131	1.00
4 Cuenta con protocolo para la remuneración de familiares.	.3704	.0000	.00	.49210	.242	1.00
5 Incomodidad en la asignación de sueldos.	3.3333	3.0000	3.00	.67937	.462	2.00
6 Asignación de sueldos según necesidades.	3.5556	4.0000	4.00	.64051	.410	2.00
7 Cuenta con proyectos de capacitación.	.3333	.0000	.00	.48038	.231	1.00
8 Aceptación por parte de los familiares de la capacitación.	2.4074	2.0000	2.00	.69389	.481	3.00
9 Cuenta con procedimiento para la evaluación de desempeño del personal.	.4815	.0000	.00	.84900	.721	4.00
10 Aplica procedimiento de evaluación a familiares.	1.4074	1.0000	1.00	1.00992	1.020	3.00
11 Se incomoda al evaluar a familiares.	1.3333	1.0000	1.00	.83205	.692	3.00

A partir de los resultados expuestos en la tabla anterior, puede observarse que hay una gran presión de la familia para que contraten familiares (media de 3.8519, mediana de 4.00 en la pregunta 3), que es incómodo para el empresario asignar sueldos a sus familiares (media de 3.3333, mediana de 3.000) aunque es un poco menor que la presión para que contraten familiares. Por otro lado, hay un poco más de aceptación de la capacitación por parte de los familiares (media de 2.4074 y mediana de 2.0000), aunque muy pocos cuentan con procedimientos de evaluación del desempeño (media de .4815 y mediana de .0000) y de los que tienen procedimientos muy pocos los aplican a sus familiares (media de 1.4074 y mediana de 1.0000).

Los resultados producto de las observaciones no participante durante la recopilación de la información se muestran en la tabla 4. La observación se enfocó hacia aspectos tales como: Existencia de colaboración y apoyo mutuo, existencia de unidad entre la familia, nivel de apertura respecto a información relevante para el trabajo, comunicación, relaciones interpersonales, voluntad para buscar la unión, estado de los lazos afectivos.

Tabla 4: Datos Recopilados a Través de la Observación

-Prevalcen actitudes defensivas: está restringida la colaboración y el apoyo mutuo.

- Sobresale la existencia de un clima de desconfianza: deterioro de la unidad.
- Existe falta de apertura: Ausencia de transparencia sobre información relevante al trabajo
- Tiende a percibirse un bajo nivel de comunicación: poco comunicativos.
- Las relaciones interpersonales están endurecidas: existen resentimientos ancestrales.
- Indicios de una ausencia de voluntad de permanecer unidos.
- Probable deterioro de los lazos afectivos.

En relación a la tabla anterior se observan dos fortalezas son las que caracterizan a las empresas familiares que han logrado sobrevivir: fortaleza y unidad. De acuerdo con las observaciones recopiladas notamos que en este negocio familiar, dichas fortalezas se ven amenazadas por: la existencia de actitudes defensivas; la desconfianza; la ausencia de transparencia; la existencia de una comunicación deteriorada; la existencia de resentimientos, recelo y sospechas; la escasa disposición para lograr la unidad y el deterioro de los lazos afectivos. Lo anteriormente señalado surge cuando las personas perciben que son objeto de actos de injusticia, inequidad y falta de transparencia. El clima que en esta empresa prevalece es resultado del conflicto que existe entre las normas que rigen a la familia y las que guían a la organización.

CONCLUSIONES

De acuerdo con los resultados obtenidos a través del estudio de caso y las respuestas al cuestionario administrado a 27 dueños de empresas familiares puede concluirse lo siguiente: Existe evidencia suficiente para afirmar que las normas familiares y las organizacionales entran en conflicto en una empresa familiar. La evidencia recopilada confirma lo señalado por autores como Belausteguigoitia (2010), Grabinsky (2010) y Rodríguez-Fornos (2008) y Álvarez-Martínez (2011). Dicho conflicto se manifiesta especialmente en los procesos de contratación de personal, remuneración, capacitación y evaluación del personal, tal como lo afirma Lansberg (1983). Esto debido a que la imparcialidad posee una connotación diferente si se trata de la familia o de la empresa. En la empresa, la imparcialidad está basada en el concepto de mérito, mientras que en la familia se fundamenta en la equidad y la necesidad.
